Question. Please identify all actions taken to reduce any concerns identified through EEOC complaints determined to be valid.

Answer. For each EEO complaint which results in an administrative or judicial finding of discriminatory conduct, HUD complies with any resulting orders to remedy the injury suffered by the complainant. Such remedies can include reinstatement, promotion, transfer, money damages, amendments to personnel records and changes to agency personnel practices. In addition, the vast majority of EEO complaints are resolved by agreement between the complainant and the agency. In such cases, without conceding that discriminatory conduct has occurred, HUD negotiates appropriate responses and/or remedies with the complainant to address the concerns underlying the original complaint.

RENTAL ASSISTANCE OVERPAYMENTS

Question. The HUD IG's fiscal year 1997 financial statements audit found a number of material weaknesses in HUD's internal controls. For example, HUD reported in 1997 that it spent some \$18 billion to provide rent and operating subsidies through a variety of programs. On the basis of data for calendar year 1996, HUD estimated that it had provided over \$900 million in overpayments. This is a huge amount of funds lost to the Department—funds that could, for example, be used for section 8 assistance. What has HUD done to reduce subsidy overpayments?

Answer. The \$900 million indicated in the question represents the potential for excess payments, which even if true, may not be recoverable by the Department. The potential overpayments arise from a number of factors, including but not limited to: tenants under reporting or unreported income and underpayment of rent, falsifying deductions which on which rent is based, errors in data base information, etc.

To overcome the problem of potential excess payment, The Secretary has directed the Department's Real Estate Assessment Center to lead a task force to analyze several income verification techniques with potential for expanded use of Federal tax return data. In recent years HUD has used computer matching to Federal tax return (Form W-2 and Form 1099 data obtained from the Social Security Administration and the Internal Revenue Service), to identify unreported tenant income and excessive housing assistance for tenants who receive rental assistance from housing agencies, owners and agents. Use of Federal tax return data has been effective in identifying prior underreported income. However, to date use of Federal tax return data has been limited to random samples of households and to selected housing agencies and owners/agents. Various techniques for expanding the use of the alternative techniques are being assessed during 1999 by the Task Force. The Depart-

ment is aggressively working at putting in place the information technology and human resources necessary to implement a large scale computer matching program.

Through the implementation of new systems and reforms, it is expected that the task force will address any policies or procedures which created the climate for either overpayments or the potential for overpayments. Six action teams chartered by the Task Force, comprised of staff from CFO, CPD, Housing, OGC, PIH and REAC, will address the following areas: 1. continue and expand income matching programs; 2. strengthen re-certification efforts; 3. expand the Social Security Administration computer matching; 4. ensure full population and data integrity of HUD's systems; and 5. institute penalties for overpayments of rental assistance, and perform monitoring and oversight.

HUD's Office of Policy Development and Research also is contracting for an evaluation of housing agencies'/owners'/agents' effectiveness in (re)certifying tenants for rental assistance.

However, it should be noted that there are various legal, technical and administrative barriers to HUD's efforts to fully and comprehensively implement income matching and verification of tenant reported income during the eligibility certification and recertification processes.

Further, the implementation of various provisions of the 1998 Housing Act will significantly impact tenant income verification. Examples of such provisions include flat rents and minimum rents. Extensive efforts have been made to improve the accuracy and timely reporting of information to the tenant data bases.

HUD with the support of the Social Security Administration, has implemented social security (SS) and supplemental security income (SSI) computer matching for all housing agencies. This computer matching is highly effective in detecting past unreported SS and SSI for tenants and in preventing future unreported income. HUD also has modified the computer system it uses to facilitate SS and SSI matching and reporting for tenants who receive rental assistance from owners and agents who administer programs of the Office of Housing. A pilot of SS and SSI matching for the Office of Housing's rental assistance programs commenced in September 1998. It is anticipated that the SS and SSI computer matching program will be expanded to all owners and agents during fiscal year 1999.

All of these initiatives are on-going and are expected to yield results during fiscal year 2000. To supplement the initial statement in this response, it should also be noted that the Task Force's full scale review also has the potential to uncover instances where tenants overpaid their rent due to not being given credit for eligible deductions, inaccuracies in the recertification process, errors in the database, etc.

PUBLIC HOUSING ISSUES

Question. We understand that the PHA in San Juan, Puerto Rico was permitted to privatize and is now under review by Justice and the HUD IG for criminal fraud. What steps has HUD taken to limit fraud at this PHA?

Answer. HUD's Atlanta Office of the Inspector General (OIG) is preparing a comprehensive report of their findings. Pending the release of that report, the Department has been informed that the following issues were raised by the Caribbean Office OIG: (1) weak internal controls; (2) some procurements were selected without sufficient competition; (3) advertising of competitive procurements was below standard; (4) cost analyses were incomplete, (5) procurement actions were not properly documented; and (6) procurement staff were not properly trained.

Pending the completion of the Atlanta OIG report, the Department developed a "work out" plan with the HA and has initiated the following interim steps:

- Increased monitoring and oversight of procurement activity at the Puerto Rico Housing Authority (PRHA) by the field office;
- Required the PRHA to hire an independent firm to run the day-to-day operation of the modernization program (\$180 million—largest source of funding, and the program that is the focus of the investigation);
- Required the PRHA to retain an Independent Public Accounting (IPA) firm to audit the accounting operations. The IPA has completed an audit of the PRHA's fiscal year 1997 and issued a qualified letter of opinion. The fiscal year 1998 audit of the PRHA operations has not been completed. The IPA has been requested to examine and reconcile all accounts/expenditures called into question during the period 1993–1996;
- Insured that the PRHA's accounting operations conform with Generally Accepted Accounting Principles (GAAP) (the PRHA complied with this requirement this month, 6 months ahead of the time established in the "work out" plan);

- Required the PRHA to create an Office of Internal Auditing to monitor and enforce compliance with internal controls (based on a proposed restructuring plan developed by the IPA); and
- Took steps to establish a training program to permit procurement staff from the PRHA to learn from another housing authority that has a model procurement system.

Question. What tools does HUD have to limit this type of problem and what has HUD done in this case?

Answer. Some of the tools available to the Department are noted above in the response to the specific actions that the Department has taken in the specific instance of the alleged fraud at the PRHA. However, this question and the response deals specifically with tools from a preventive perspective.

Under the new Public Housing Assessment System (PHAS), which replaced PHMAP, the annual audit of HAs by an Independent Public Accounting firm will be more stringent. In addition, pursuant to Management Reform 2020, HA accounting practices are now required to conform with the GAAP. Further, HUD will continue to require risk-based Field Office monitoring, and more responsive public trust (i.e., earlier reporting of perceived discrepancies, inconsistencies or potential fraud). Finally, as appropriate, the Department will request assistance from the OIG in uncovering procurement irregularities.

HOMELESS ASSISTANCE

Question. HUD moved over \$20 million from the fiscal year 1999 homeless assistance funds to fund fiscal year 1998 supportive housing applications. Congress was not advised of this funding decision before the transfer of funds and the decision runs counter to how we budget for activities under appropriation accounts within the Subcommittee. What is HUD's legal justification for this action and was the action reviewed for consistency with the HUD Reform Act as well as relevant appropriation requirements?

Answer. The Department acted in full accordance with all programmatic statutory and regulatory requirements, HUD Reform Act requirements and all applicable appropriation requirements in the award of 65 non-competitive Supportive Housing Program (SHP) grants in fiscal year 1999. As detailed in the January 19, 1999 opinion by Associate General Counsel Robert Kenison, the legal authority for non-competitive awards under SHP is expressly identified in Section 583.235(a) of the Code of Federal Regulations. Additionally, as specified in Associate General Counsel Kenison's opinion, HUD published notice in the Federal Register on February 4, 1999 identifying the legal basis for awarding SHP funds non-competitively and advising all applicants of the funding action being taken.

Question. Please identify the legal citation for this action?

Answer. As stated immediately above, the legal basis for the funding action taken in awarding SHP funds non-competitively is found at 24 CFR 583.235(a). This provision specifically provides that SHP projects "may be renewed on a non-competitive basis."

Question. Were conversations held with jurisdictions before awards were made? Please identify all conversations—the dates, subject matter and parties.

Answer. It is normal, routine, and expected practice that applicants not selected during the award of McKinney Act funding make contact with various HUD officials in both Headquarters and Field Offices following the grant announcement process seeking an explanation for their non-selection. That pattern was maintained following the December 1998 announcement of McKinney Act project selections. Please find attached, to the extent this information could be recollected by the individuals involved, a listing of conversations by date, subject and individuals that we believe is responsive to your request.

REQUESTED CHART OF CONVERSATIONS WITH APPLICANTS SUBSEQUENTLY AWARDED FUNDS NON-COMPETITIVELY

Date	Spoke with	Regarding
HUD Participant: Jean Whaley		
December 29, 1998	Bob Durando City of Portland, Maine	Debriefing on lack of award.
December 29, 1998	Matthew Eddy & Dana Totmann, City of Portland & State of Maine	Other resources for homeless assistance review team process comparison of last year's applications.
January 4, 1999	Bob Duraslo, City of Portland, Maine	Request for faxing of Gaps Chart submitted.
	Matthew Eddy, City of Portland, Maine	(No notes).
	Bill Johnson congressional staff (Maine)	Explanation of award process.
January 5, 1999	Matthew Eddy, City of Portland, Maine	No notes.
January 6, 1999	Bill Johnson, congressional staff (Maine)	Arranging meeting between Maine officials and HUD.
January 7, 1999	Bill Johnson, congressional staff (Maine)	Confirm meeting.
January 11, 1999	Matthew Eddy, City of Portland, Maine	Questions on (1) S + C 10 percent set aside; (2) PRN for 1998; (3) Scores; and (4) Differences in Gaps Chart.
January 11, 1999	Penny Madrey Johnson, Director of Housing, Dayton, OH	Debriefing Dayton applicants via phone.
January 13, 1999	Stacy Austin & Bob Durando's assistant, City of Portland, Maine	Faxing Bob Durando the scores for Maine.
January 13, 1999	Unknown Participants from Oklahoma City, Oklahoma	Debriefing Oklahoma City applicants via phone.
January 15, 1999	Stacy Austin, City of Portland, Maine	(No notes).
January 19, 1999	Penny Madrey Johnson-Director of Housing, Dayton, OH	Debriefing phone call for applicants in Dayton.
January 20, 1999	Delegation of representatives from both the City of Portland and the State of Maine.	Attended meeting between HUD and Maine delegation.
HUD Participant: Cliff Taffet		
January 20, 1999	Delegation of representatives from both the city of Portland and the State of Maine.	Failure of any projects in either Portland, Maine or State of Maine to be funded.
HUD Participant: John Garrity		
January 13, 1999	Unknown participants from Oklahoma City, Oklahoma	Conference call to debrief applicant on reasons for low score in the homeless competition.
January 19, 1999	Penny Madrey Johnson, Director of Housing, Dayton, OH	Conference call to debrief applicant on reasons for low score in the homeless competition.
Numerous calls (uncertain of exact dates) between January 11-19.	Matthew Eddy, City of Portland, Maine	Information on reasons the City of Portland, Maine and the State of Maine failed to be selected for any award in the homeless competition.
January 20, 1999	Delegation of representatives from both the city of Portland and the State of Maine.	Failure of any projects in either Portland, Maine or State of Maine to be funded.

EMPOWERMENT ZONES

Question. A recent IG audit concluded that HUD does not have an effective program of oversight and control of the program. What is HUD doing to ensure that empowerment zones are functioning according to their local plan?

Answer. On March 12, 1999, the Empowerment Zone/Enterprise Community (EZ/EC) Initiative Office fully responded to the finding and conclusions reached in the recent IG audit report. The report was based on audits in four Empowerment Zones and a review of HUD's EZ/EC Initiative Office. The EZ/EC Initiative Office found that the report came to a number of erroneous conclusions.

HUD's oversight and controls are consistent with its statutory and regulatory responsibilities. HUD has two main statutory and regulatory responsibilities related to the EZ/EC Initiative. First, HUD is responsible for designating new urban EZ/ECs. See 26 U.S.C. 1391. 24 CFR 597.300–597.302. Second, HUD is responsible for “regularly” assessing the progress of the urban EZ/ECs so it can make a periodic determination as to the continuing eligibility of the EZ/EC.

HUD's monitoring responsibility derives primarily from section 1391(d)(2) of the Omnibus Budget Reconciliation Act of 1993, which provides for the revocation of an EZ/EC's designation if the HUD Secretary determines among other things, that a designated EZ/EC is not complying substantially with, or has failed to make progress in achieving the benchmarks set forth in the strategic plan. The implication of this responsibility is that HUD will collect and review information relating to the progress of the EZ/EC toward achieving its strategic plans.

The Department has issued regulations to implement this requirement. See 24 CFR 597.400–597.403. Pursuant to regulation, EZ/ECs must submit “periodic” reports to HUD detailing the actions they have taken to implement their strategic plans. HUD uses this information along with other information to evaluate the progress of the EZ/ECs.

To keep abreast of the EZ/EC activities, HUD requires each EZ/EC to submit performance reports that detail the progress made toward implementation of the strategic plan. To date, HUD has formally evaluated the progress of the EZ/ECs once and released the results of that determination in March 1997. As a result of the first biennial evaluation, five of the 72 EZ/ECs were issued warning letters requiring them to improve their performance or risk losing their designation.

HUD uses a number of tools to keep track and oversee the interim progress of the EZ/ECs. For example, the EZ/EC Office receives feedback based upon annual field office assessments. In addition the annual reports from EZ/ECs and field office assessments, HUD receives information from the following:

- the applicable HUD Secretary's Representative who is responsible for helping the particular EZ/EC implement its strategic plan;
- monthly telephone conferences with the EZ/ECs;
- residents or other stakeholders associated with the EZ/EC;
- HHS—the agency that funds the EZ/EC Initiative;
- the States that are responsible for distributing the funds to the EZ/ECs;
- the lead entity responsible for implementing the EZ/EC strategic plan; and
- news accounts relating to the EZ/EC.

As noted above, one of the unique aspects of the EZ/EC initiative is its reliance on performance measurements to ensure local implementation efforts are a success. The HUD EZ/EC Office works closely with the EZ/ECs to ensure they fully understand the principles of performance measurement and the importance of accurate reporting. In fact, the EZ/EC Office has implemented a new automated Performance Measurement System (PERMS) to improve the understanding of EZ/ECs and the accuracy of reporting. Training and technical assistance to grantees on performance measurement is scheduled for July. This will include hands-on instruction from a staff and a consultant who will review EZ reporting for accuracy and appropriateness.

The next “periodic” performance report is due at HUD the end of August 1999. At that time, it will be forwarded electronically to the appropriate field office for review and evaluation. The field offices will evaluate the progress or lack of progress and the status of each implementation plan and report to Headquarters that information.

In addition, each EZ/EC keeps track of the projects and programs it uses to meet the goals of its strategic plan. In addition, the individual projects and programs have implementation plans formerly called “benchmarks” that track the results such as the number of jobs created, the number of loans provided to businesses, and the number of child care slots provided to residents. The implementation plans, which are approved by the local EZ/EC governance structure, provide a blueprint for action

by and evaluation of the EZ/EC. Together with State and local government oversight these efforts result in continuous tracking of EZ/EC progress.

Question. Please provide a status review of each empowerment zone—achievements and failures.

Answer. Since its inception in 1994, the Clinton/Gore Administration's EZ/EC Initiative has produced outstanding results by empowering people to create business opportunities and jobs, leverage public and private partnerships, provide affordable housing and make their communities safer and better places to live. Distressed neighborhoods—with some of the deepest pockets of poverty in the nation—are now on the road to recovery. After decades of decline, there are now great opportunities and brighter futures for residents and families living in the EZ/EC neighborhoods.

Hundreds of individual EZ/EC achievements are featured in our three best practice publications called, "What Works!—Volume 1, Volume 2 & Volume 3." The following EZ/EC-reported accomplishments provide a national snapshot of the cumulative accomplishments of the Empowerment Zones and Enterprise Communities as reported by the EZ/ECs. The EZ/ECs reported this information using the new Internet-based EZ/EC Performance Measurement System (PERMS). The cumulative results shown below are based on the inaugural submissions by the EZ/ECs. We expect the quality and quantity of reporting to improve over time as the EZ/ECs become more familiar with PERMS and more sophisticated in the art of performance measurement in general.

Projects and Programs.—The EZ/ECs report that 2,600 neighborhood-based projects and programs have been developed and are underway as a result of each EZ/ECs' locally-derived strategic plan. Federal EZ/EC seed money has leveraged over \$10 billion in additional public and private sector investments related to the implementation of local EZ/EC strategic plans.

Workforce Development.—The Empowerment Zones and Enterprise Communities report that they are engaged in more than 550 job training programs with over 42,000 Zone residents having received job training. Nearly 30,000 Zone residents have been placed in jobs as a result of these job training programs. Zone residents have attended approximately 270 job fairs resulting in 16,000 job placements.

Access to Capital.—As a result of the Empowerment and Enterprise Zone initiative, access to cheap sources of capital—the lifeblood of commerce—has greatly improved. Loan pools totaling \$2 billion dollars have been created with 1,700 loans processed and 5,000 jobs created from those loans. The EZ/ECs report that over 4,300 businesses have been served by the capital access/credit access programs and 4,500 businesses have received technical assistance. In addition, the EZ/EC Initiative has created the largest community development bank in the nation—the \$430 million dollar Los Angeles Community Development Bank—which has loaned over \$70 million to businesses that could not obtain conventional bank financing.

Housing.—The Empowerment Zone and Enterprise Communities report that they have completed 2,400 housing units and have rehabilitated another 11,000. Nearly 14,000 homeless people have been served under the "homeless to housing" program. Within the Zones and Communities, there are 146 homeownership programs that have served 8,600 residents.

Private Sector Involvement.—Private sector involvement has played a vital role in the Empowerment Zones and Enterprise Communities. Countless corporations have hired Zone residents and actively participated in EZ/EC governance, as well as provided funds and in-kind technical assistance to the Zones. Well-known companies involved in the Zones include General Motors, Ford, Chrysler, Home Depot, The Walt Disney Company, GAP, Inc., Ameritech, Rite Aid, Microsoft, Starbucks, MCI/Worldcom, IBM, and scores of others.

Environment.—The EZ/ECs report that they are engaged in 39 Brownfield's projects—transforming abandoned and contaminated commercial and industrial sites into clean, reusable parcels of land. Forty-three sites have been transformed to date. The EZ/EC's are also involved in approximately 180 beautification programs.

Public Safety.—The EZ/ECs report that nearly 380,000 people have been served by the 300 public safety programs operating in the Empowerment Zones and Enterprise Communities. There are 580 crime prevention programs which have served 310,000 residents.

Health Care.—There are 220 health-related programs in the EZ/ECs serving 94,000 residents. Seven new health-care facilities have opened in the EZ/EC neighborhoods and four have been remodeled which has expanded service to 9,000 EZ/EC residents.

Human Services.—Within the Empowerment Zones and Enterprise Communities, there are a number of human services underway serving residents including:

—369 recreation programs serving over 116,000 Zone residents;

- 157 child care programs serving over 4,850 Zone families;
- 21 elderly programs serving over 2,480 Zone residents; and
- 339 youth programs serving over 65,000 Zone youth.

Education.—Vital to the well-being and economic development in the EZ/EC's is education and as a result of the EZ/EC initiative, many education and training programs have served Zone residents. The EZ/ECs report:

- residents have been served in 641 K–12 education programs;
- residents have been served in 106 vocational education programs;
- residents have been served in 74 post-secondary assistance programs; and
- Approximately 13,300 residents have been served in 152 head-start/pre-school programs.

FHA SINGLE FAMILY PROPERTY INSURANCE

Question. What steps has HUD made to reduce actuarial risk to the Mutual Mortgage Insurance Fund. For example, insurance claims increased over 25 percent between 1996 and 1998, from 60,884 claims to 76,086 claims. In addition, the total claim payments increased 38 percent, from \$4.2 billion to \$5.8 billion during this period.

Answer. MMI claims have increased from 53 thousand claims for \$4.1 billion in 1996 to 59 thousand claims for \$5.3 billion in 1998, an increase of 12 percent in the number of claims and 29 percent in cost. In order to reduce the risk from claims, the Department has analyzed the reasons for the increases.

1. The average dollar value of an MMI insured mortgage has risen 34 percent between the 1992 book of business and the 1998 book, even while the loan limits locked FHA into a lower value portion of the market in many areas.

2. The very large 1993 and 1994 books-of-business are approaching their peak claim period (estimated to be in years 5–8 after endorsement).

3. The economic downturn in California led to increased reliance on FHA insurance during the 1990s, since FHA does not reduce the level of business in economically troubled areas. In 1992, California loans comprised only 9 percent of the dollar volume of MMI portfolio; steady growth brought this to 19 percent in 1998. Additionally, much of California also qualifies as high cost area, so that the average loan is higher than much of the rest of the U.S. and the continuing economic problems in some areas of the State have produced higher claim rates.

4. The increased use of adjustable rate mortgages (ARMs)—rising from 16 percent in 1992 to 35 percent in 1997—has led to increases in both costs and numbers of claims in MMI. Currently the low mortgage interest rates on fixed-rate mortgages (FRMs) in 1998, combined with FHA actions changing underwriting for ARMs, have reduced the percentage of ARMs to about 20 percent in 1998.

As a result of this analysis FHA has taken several steps to mitigate these risks which include:

1. In 1998, FHA started requiring that borrowers qualify for ARMs at 1 percent above the initial interest rate, and prohibiting “buydowns” of the ARM interest rate. This change will not be an immediate cure, as FHA cannot change the terms of loans already written, but we expect ARM claim rates should be more similar to the FRMs in the future.

2. The FHA loan limits were increased to a 48 percent floor and an 87 percent ceiling relative to the Fannie/Freddie conforming loan limit. These increases are also expected to reduce the rate of FHA claims relative to the Insurance in Force (IIF), and increase recoveries on claims. FHA experience has shown that loans in the middle of a market are less likely to go to claim, and are less costly. They also result in higher recoveries, as the properties are more salable. Increasing the loan limit allows FHA more participation in the lower-risk mid-market loans.

3. FHA has increased the use of loss mitigation which allows homeowners to stay in their homes where possible, and preforeclosure sales which reduce the magnitude of loss to the Fund. Making incentive payment to a lender for modifying a loan; engaging in special forbearance action; or filing partial claims are substantially less expensive than the cost of foreclosing, holding, and selling a property. There are substantial savings to the MMI Fund and benefits to the homeowners and communities in applying loss mitigation techniques to allow the homeowners the chance to keep their homes.

4. The Department has implemented an REO disposition method which uses management and marketing contractors. This is also expected to reduce expenses by providing a higher recovery on FHA properties than previously received.

5. The Department has implemented the Homebuyer Protection Plan. This plan was designed to address the issue of inadequate FHA appraisals. The plan has the following components:

- Appraisals will be more thorough and will identify basic physical conditions and potential problems;
- Homebuyers will be notified of defects and the FHA insured loan cannot be closed until all conditions are satisfied;
- Appraisers will be accountable and tougher sanctions will be imposed for deficient appraisals;
- The appraiser will recommend a full home inspection if a significant problem is present;
- Home inspection costs up to \$300 may be financed in FHA mortgages;
- Homeowner counseling will be emphasized;
- The FHA loan evaluation system will be available to all FHA-approved lenders;
- FHA up-front premiums will be reduced for homebuyers who receive counseling and/or purchase center city properties after counseling; and
- A system to refer homeowners who are in danger of serious default to counseling or other assistance will be developed.

These actions are expected to ensure that homebuyers get good quality homes that will prevent major unexpected costs which might lead to early claims and to give more timely access to counseling or other assistance before a homeowner is enmeshed deeply in debt. Where a claim is unavoidable, the actions are also expected to provide a better return to the MMI Fund.

Question. In addition, REO properties have risen over 25 percent over the last two years, with “on-hand” properties of 31,000 and 40,000 properties in 1997 and 1998. Has HUD implemented the property disposition reform legislation included as part of the VA/HUD 1999 Appropriations bill? What other steps is HUD taking to reduce its HUD-owned inventory?

Answer. HUD has not yet implemented the new property disposition legislation; and, as stated in the 1999 and 2000 Budgets, does not intend to begin implementation before fiscal year 2002, with a phase-in period through fiscal year 2004. One of the lessons of the assignment reform legislation is that FHA needs sufficient time to implement major changes to the FHA programs to involve the community and to allow lenders and credit counselors to become familiar with the changes. This legislation was requested to give FHA an additional tool to increase returns to the fund, to be applied as conditions warrant.

An additional reason for delaying the implementation of the legislation is that FHA implemented, in March of 1999, the Management and Marketing contracts which allow private concerns to maintain and sell HUD-held properties. Some time will be required to evaluate the effectiveness of this effort.

Question. Also, GAO’s high-risk review of HUD indicated that there are serious issue with regard to the use of appraisals (based on audits in New Jersey and Ohio), where the appraisals did not take into account structural soundness and continued marketability of Housing. What is HUD doing to ensure that appraisals reflect the market value of a property?

Answer. The Management and Marketing contracts are a major step HUD has taken to reduce the property inventory. As of March 31, 1999, 16 contractors have been managing the FHA-held single family properties, each handling a region of the country. The contractors have bid to receive a percentage of the selling price, so they have a real incentive to sell the properties for the highest possible price and as fast as possible. These contracts are expected to reduce inventories, lower holding time and costs, provide better security and maintenance while properties are in the inventory, and increase sales proceeds.

Note: Senator Bond is using claim numbers somewhat at variance with our budget numbers. MMI claims shown in the actual columns of the Budgets were:

- 53,111 and \$4,113M in 1996 (1998 Budget) and
- 59,275 and \$5,291M in 1998 (2000 Budget) and
- The total SF number of properties shown on the roll-forward tables from accounting is 26,837 on 9/30/96; 34,116 on 9/30/97, and 39,370 on 9/30/98.

FAIR HOUSING INSURANCE INVESTIGATIONS

Question. HUD is trying to micromanage CDBG, HOME and public housing through fair housing policy. For example, HUD recently issued a proposed rule that conditioned the receipt of CDBG funds on an acceptable (as approved by HUD) fair housing policy by the state or locality. HUD also has interfered with the ability of PHAs to address discrimination complaints by prohibiting PHAs from using public housing funds to investigate or litigate complaints. HUD also has threatened to cut off public housing funds to PHAs unless PHAs settle any discrimination complaints. Mr. Secretary, your comments.

Answer. A “charge” of a violation of the Fair Housing Act by HUD is not mere accusation or allegation. Pursuant to the Fair Housing Act regulations, HUD may only issue a charge after HUD has:

- determined that the allegations state a claim under the Fair Housing Act;
- determined that the claim is timely;
- determined that the complainant has standing to assert the violation;
- notified the respondent of the Fair Housing Act complaint;
- permitted the person to submit any evidence that responds to the allegations;
- investigated the complaint, including exculpatory evidence;
- attempted to conciliate the complaint; and
- based upon its full investigation and all evidence submitted by both parties, determined that reasonable cause exists to believe a discriminatory housing practice has occurred.

The Department has a statutory duty to affirmatively further fair housing in all HUD programs, including the Community Development Block Grant program. When the Department has credible evidence that a jurisdiction has violated the Fair Housing Act or other civil rights authorities administered by the Department, it is obligated not only to pursue the case under civil rights authorities, but to ensure that HUD is not furthering the discrimination by funding the jurisdiction that is violating a fair housing law. HUD has been sued for its failure to ensure such affirmative furthering of the fair housing laws in the past.

If a jurisdiction has been charged with a Fair Housing Act violation, this serves as evidence challenging the jurisdiction’s certification that it is complying with fair housing laws. HUD regulations require that the jurisdiction be consulted and be given an opportunity to cure the suspect certification. In many instances, the Department will require the jurisdiction to provide special assurances of compliance with fair housing laws prior to obligating the CDBG funding. If the jurisdiction does not cure the suspect certification by resolving the fair housing charge or providing adequate special assurances, then the Department will reallocate the CDBG funding to other jurisdictions that are complying with fair housing laws.

Once a court renders a judgment in a fair housing case, the matter is resolved and there is no need for the Department to take further action.

HUD issued a proposed rule in order to obtain public comment. The Administrative Procedures Act requires this and the Department was evaluating the public comments. HUD fully complied with the Administrative Procedure Act requirements. In fact, HUD extended the comment period and invited numerous groups (including a briefing with representatives from the House Majority staff of the Housing Subcommittee on Housing and Community Opportunity) to discuss their views during this comment period.

HUD does not require submission and approval of a jurisdiction’s analysis of impediments to fair housing choice. However, HUD provided extensive training and developed a guide to provide information on developing an analysis of impediments. In 1996, HUD published a Fair Housing Planning Guide which provided information on how to conduct an Analysis to Fair Housing Choice, undertook activities to correct the identified impediments, and the types of documentary records to be maintained. In addition to HUD field staff working with communities, HUD conducted 22 training sessions nationwide during the summer, fall, and winter of 1997. These sessions were attended by over 1,700 people representing CDBG and HOME grantees, public housing agencies, fair housing organizations, and housing industry groups. These sessions educated participants about the rights of their constituents to fair housing planning.

HOME IMPROVEMENT LOANS

Question. GAO in July 1998 reported problems with HUD’s oversight of the lenders’ compliance of the home improvement loan program, noting that in fiscal year 1997, HUD conducted on-site quality assurance reviews of only 4 of the 3,700 lenders in the program. What is HUD doing to ensure that lenders’ comply with the home improvement loan program and homeowners are not being defrauded?

Answer. FHA has charged the Home-Ownership Centers (HOCS) with reviewing a portion of the 203(k) home improvement loans, as well as other FHA loans, for compliance with FHA regulations. If substantial violations are found the case is forwarded for remediation and/or penalties. This April, FHA furnished additional information to GAO regarding oversight of the 203(k) program. A summary of this information follows: from January 1, 1996 through February 28, 1999, FHA performed 52 quality assurance reviews on lenders originating 203(k) loans, resulting in 3 referrals for Limited Denial of Participation, 6 Referrals for Debarment, 9 lenders re-

errals to the Mortgagee Review Board, and 3 additional firms referred to the HUD OIG for violations.

Based on data for January 1996 through February 1999 period, 203(k) loans are concentrated among a relatively few lenders. While 2,158 different lenders made these loans, 89 lenders (4 percent) wrote 60 percent of the 50 thousand loans. The Quality Assurance Divisions monitored 19 percent of these high volume lenders in this period.

On Title I cases, a training program is being developed so that staff can exercise closer scrutiny on cases going to claim to ensure that the proper underwriting standards were applied when the loan was written. FHA plans to review cases going to claim in 1998 and 1999, with further reviews depending on the results.

HOME WARRANTIES

Question. HUD is revising the requirement that new homes covered by FHA mortgage insurance be protected through 10-year structural warranties; in the future, the warranties will not have to exceed a 1-year period. Why is HUD reducing the time that new homes must be covered by structural warranties?

Answer. HUD published the Builder Warranty Rule for High-Ratio FHA-insured Single Family Mortgages for New Homes in the Federal Register on March 25, 1999, as an interim rule in order to avoid elimination of all warranties under the terms of the Downpayment Simplification provisions (Sec. 212) of the fiscal year 1999 Appropriations Act. Congress extended this legislation for Downpayment Simplification for loans executed for insurance in fiscal years 1998, 1999 and 2000. Statutory provisions of the Downpayment Simplification program would override and eliminate all existing FHA high ratio requirements. However, instead of eliminating warranty requirements entirely, FHA changed the requirement to a comprehensive, 1-year builder warranty. This type of warranty, which is standard in the home building industry, is consistent with the intent of the Down Payment Simplification legislation, which was to bring FHA requirements more in line with the private sector practices.

The background and rationale behind the Builder Warranty Interim Rule also provide perspective on the interim rule. Prior to approval of the 1999 HUD/VA Appropriations Act, FHA required new homes (a year old or less) to meet certain conditions in order to qualify for a high ratio loan (defined as those loans with a loan-to-value ratio greater than 90 percent), including pre-approval of plans and specifications for the home or the requirement of a home warranty "acceptable to the Secretary of HUD."

FHA believes that the warranty change is sound policy for several additional reasons:

1. The 10-year warranty requirement costs FHA borrowers hundreds of dollars more than a standard 1-year builder's warranty, yet it provides relatively little effective protection to consumers in the later years. Rather than force FHA borrowers to pay for this warranty, HUD is bringing its requirements into line with the rest of the home finance industry.

2. FHA is not prohibiting 10-year warranties; rather it would no longer require these warranties to qualify for high ratio loans. The builder or 10-year warranty provider can still provide these warranties and homebuyers can still purchase them. New construction represents approximately 3 percent of FHA business in the recent past, so the overall impact of the elimination of the 10-year warranty requirement is slight.

3. Building industry standards and local code enforcement practices have progressed substantially since the 10-year warranty was first instituted, providing much greater protection to consumers. Furthermore, local government agencies are much more aggressive in enforcing local building codes, further mitigating the risk of significant problems with a newly constructed home.

That being said, the Department is sensitive to the issues outlined in the comments we have received, and, as a result, has withdrawn the Builder Warranty interim rule, effective April 23, 1999. Although the points outlined still represent the position of the Department, it has agreed to further consider this issue.

FINANCIAL AUDIT OF HUD'S FISCAL YEAR 1998 FINANCIAL STATEMENTS.

Question. Clean Financial Audit of HUD's fiscal year 1998 Financial Statements. For the first time, the HUD IG (and KPMG) was able to conclude that HUD's consolidated financial statements were reliable in all material aspects. Nevertheless, while HUD deserves praised for this result, the final audit reflects serious and continued weaknesses in HUD's internal controls and financial management systems. For example, HUD remains unable to ensure the reliability of income data for pur-

poses of determining the Federal subsidy payment. As discussed elsewhere, HUD estimated that it overpaid rental subsidies by \$900 million in 1997 because of poor data control. This audit also determined that HUD was unable to substantially comply with the Federal Financial Management Improvement Act (FFMIA).

Nevertheless, KPMG's March 9, 1999 report on FHA's financial statements concluded that (1) FHA must address staff and administrative resource issues; (2) FHA must place additional emphasis on early warning and loss prevention systems for insured mortgages; (3) FHA must improve federal basis and budgetary accounting; and (4) Information technology systems must be improved. KPMG raised a number of other serious FHA issues, especially with regard to HUD-held properties. What steps has HUD taken to address these concerns?

Answer. Local administrators of HUD's rental assistance programs (i.e., public housing agencies and private owners/management agents) determine rental assistance eligibility and level of benefits based primarily on household income data. Long-standing problems have been that: (a) some tenants fail to report all income as required, and therefore receive excess rental assistance, and (b) local administrators generally do not have access to income data needed to determine if tenants failed to disclose all their income.

As a partial solution to the problem, in recent years HUD has supplied local administrators with social security and supplemental security income data that HUD receives from the Social Security Administration, for tenants scheduled to recertify for rental assistance. The income data provides up-front income data to prevent future abuses, and to detect past abuses.

Because of various legal, technical and administrative constraints, local administrators generally cannot obtain access to other income data, i.e., wages and unearned income data, needed to detect income amounts that tenants fail to report. The excess rental assistance tenants receive from failing to report their income occurs primarily from the legal, technical and administrative constraints—not from poor data control. HUD plans to implement a large-scale computer matching program in calendar year 1999 that will aid significantly in detecting and deterring program abuses involving unreported income. This initiative involves the use of wage and unearned income data that HUD receives from the Social Security Administration and the IRS.

Hopefully, by the end of July, detailed Corrective Action Plans will be established to address all of the deficiencies identified in both the FHA and HUD audits. In most cases, the Department has already initiated, or is well on its way in accomplishing recommended improvements. For example, FHA developed and implemented an approach in the past year to meet Federal accounting standards for the fiscal year 1998 Financial Statements, in addition to continued compliance with commercial standards. This was a major accomplishment and enabled the auditor to render a clean opinion on the Department's consolidated financial statement. FHA has formulated detailed workplans to refine and make further improvements. For example, for the material weakness "Federal Basis and Budgetary Accounting Must Be Improved" identified in the audit of 1998 FHA financial statement and noted in the question, KPMG made five specific recommendations. FHA responded with a management workplan to implement each, with which the independent auditor agreed. The audit recommendations and workplan are as follows:

1. Implement routine procedures to analyze unliquidated obligations for contracts and purchase orders and de-obligate those items which have expired, timely;
 - FHA plans to implement routine procedures, as recommended, to analyze unliquidated obligations for contracts and purchase orders and de-obligate those items which have expired, all in a timely manner. Although details of the new procedures have yet to be worked out, the three offices to be involved in coordinating the new procedures have all agreed in writing to ensure that the task is accomplished.
2. Reconcile the accounting and budget systems for loan guarantee commitments and endorsements, to ensure all credit subsidy amounts are recorded properly;
 - FHA is reconciling the accounting and budget systems for loan guarantee commitments and endorsements and has reissued to the field the established procedures related to positive credit subsidy. Beginning with fiscal year 1999, regular reconciliation of obligational and disbursement reports are being conducted to resolve discrepancies and to correct records on an on-going basis. Prior-year disbursements and obligations are being reconciled to determine whether a cumulative adjustment is needed. Additionally, a comprehensive examination of reporting systems, field guidance, and budget execution procedures is underway, including implementation of a new Development Application Processing (DAP) System to provide integrate loan application processing by field offices with on-line funds assignment and control.

3. Prepare formal documentation of the process to prepare Federal basis financial statements and the SF-133, which includes cross walks of GAAP accounts to the Federal basis, and identify all required sources of budgetary system information;

—Last year FHA recognized the need for documentation of the process, and included the requirement in the statement of work provided to the contractor responsible for preparation of the fiscal year 1998 financial statements. The contractor has documented the process to prepare Federal basis Financial Statements and the SF 133s. Also, the contractor is implementing the use of budgetary accounts in the FHA accounting system.

4. Prepare formal documentation of the cost allocation time survey process, and conduct the survey periodically during the year; and

—FHA agrees that a routine cost allocation time survey must occur. The process used to conduct the cost allocation survey for fiscal year 1998 was not formally documented because FHA had not decided whether to continue using the same survey methodology, however, this documentation was completed in March. FHA plans to conduct a mid-year and an year-end time allocation survey for fiscal year 1999 using the same approach used last year. The mid-year survey will be initiated shortly using an updated list of approximately 150 survey recipients. In fiscal year 2000 and future years, FHA will continue to utilize the time allocation survey approach periodically throughout the fiscal year, while also investigating alternate sources of full cost identification and time allocation data such as Activity Based Costing (ABC).

5. Implement existing plans to address identified financial management issues related to the LLG.

—FHA's contractor has completed documentation of model data sources and assumptions, as well as LLG methodology and sensitivity analysis. Policies and procedures are currently being developed.

LOS ANGELES COMMUNITY DEVELOPMENT BANK (CDB)

Question. This CDB was funded by HUD with \$430 million as part of the Federal efforts to rebuild LA after the 1992 riots. The bank was created to help businesses rejected by commercial lenders and assisting unsophisticated borrowers into the banking world while requiring them to hire residents of the urban core. While the bank is still operating, it is troubled with more than a third of its major borrowers out of business or in trouble with their loans. Also, only about 132 jobs for residents in the poorest areas obtained jobs as a result of bank investments. Currently, the bank is subject to a number of lawsuits which claim intrusive requirements by the bank caused defaults and business failures. This is a HUD-funded entity and HUD retains responsibility for oversight of the use of the HUD funds used to capitalize this institution. What has HUD done to provide oversight of this institution and what steps has HUD taken to prevent continued losses and possible misuse of funds.

Answer. HUD's designation of the Los Angeles City and County Empowerment Zone application as a supplemental Empowerment Zone was not part of the Federal government's initial commitment to rebuild Los Angeles after the 1992 riots. Rather, it grew out of the Administration's Empowerment Zone/Enterprise Community initiative.

The city cited the need for the CDB as the lack of financial assistance from commercial lenders to new and existing businesses in the EZ target area. However, there was no requirement in the EDI grant or Section 108 Loan Guarantee that the CDB assist businesses rejected by commercial lenders or to assist unsophisticated borrowers.

The Los Angeles Community Development Bank was funded as part of HUD's designation of the Los Angeles City and County empowerment zone competition in December 1994. The City of Los Angeles received \$100 million in Economic Development Initiative (EDI) grant funding to be matched with an equal amount of Section 108 Loan Guarantee funding and the County of Los Angeles received \$25 million in EDI grant funding to be used in conjunction with \$25 million in Section 108 Loan Guarantees. Note that of the amounts provided to LA County, \$15 million in EDI and \$15 million in funds guaranteed by Section 108 were pledged to the CDB. Thus, the LA CDB was to be capitalized with \$115 million in EDI grant funds and \$115 million in Section 108 Loan guarantees.

Seventy-five percent of these funds were to be used within the City's and County's Empowerment Zone (EZ) target area. The remainder of the funds could be used for activities in an area up to a one mile radius around the EZ target area as long as 51 percent of the jobs created went to Zone residents. Overall, the funds were to create jobs primarily for Empowerment Zone residents.

In addition to this funding, the City and County of Los Angeles had received pledges from private banks in Los Angeles to contribute an additional \$200 million to the CDB for its lending operations. Finally, at the time that the City applied for the EDI grant funds, it also advised HUD that it intended to request an additional \$200 million in Section 108 Loan Guarantee commitments. The CDB would administer this amount in areas which are outside of the EZ target area and are not part of HUD's original EZ supplemental designation.

With respect to the CDB's performance, the CDB, as of March 1999, has accomplished the following:

- approved 132 loans totaling \$73.1 million, consistent with the CDB's 10-year business plan;
- funded businesses that are projected to create or retain 2,148 jobs;
- created 744 jobs of which 19 percent have gone to residents who live within the boundaries of the federally designated Empowerment Zone (and though 51 percent of the jobs created to date have not gone to EZ target area residents, the CDB believes that this percentage can be met).

Note that HUD's expectations are that over the 10-year projected life of the funds provided to the CDB, the jobs created or retained will go predominantly to target area residents. The CDB has introduced new measures to work with businesses to achieve this target.

Through January 31, 1999, the CDB has charged off 8 loans out of more than 100 loans. Those 8 loans total \$2.5 million. Of the 8, 50 percent were for loan amounts of less than \$100,000 each. To the best of the CDB's knowledge, two of the remaining 4 have gone out of business.

With regard to the subject of lawsuits and intrusive requirements by the bank, it is our understanding that these requirements relate to the HUD federal program requirements emanating from the EDI grant program and the Section 108 Loan Guarantee program generally and this specific EDI grant developed for the CDB in particular, especially those requirements regarding location in or within the one-mile radius of the EZ target area and job requirements.

In May of 1999, HUD carried out an intensive review of the CDB for compliance with the program regulations, EDI grant and Section 108 Loan Guarantee regulations and related contracts. Based upon preliminary information from those reviews, HUD believes that the CDB and Los Angeles City and County are generally in compliance with such requirements. It is expected that some recommendations will be made to improve the quality of record-keeping.

With regard to the particular steps HUD has taken to prevent continued losses and possible misuse of funds, HUD has not found that any funds have been misused. HUD believes that the CDB has established generally acceptable underwriting and due diligence criteria. However, we expect to make some observations on the issue.

Finally, the initial CDB proposal had \$200 million, a dollar-for-dollar match, in commitments from private financial institutions to co-lend and otherwise participate with the CDB in assisting businesses. To date, the co-lending commitments have provided a tiny fraction of that amount. In fact, \$28 million in such commitments have been realized from other commercial banking institutions that had not originally made such pledges.

This lack of private market participation has placed additional burdens on the CDB in terms of loan origination and shared security and risk. As a result, the CDB appears to be taking on a greater level of responsibility for the economic revitalization of the target area than originally contemplated. At the moment, HUD believes that the CDB's performance is consistent with its original business plan projections. We believe that operations to date are generally within the original parameters of the EDI grant agreements and the Section 108 Loan Guarantee contracts.

SECTION 108

Question. Please provide a status of all section 108 loan guarantees by amount and project use. Also, identify the failure rate and the reasons for any failures.

Answer. A list of all commitments approved under Section 108 (to May 31, 1999) is attached. A breakdown of projects by activity classification is available for commitments approved during fiscal year 1996 and fiscal year 1997. The results are as follows:

	Fiscal year	
	1996 ¹	1997 ¹
Economic development	61	56
Housing activities	16	23
Public facilities/improvements	15	13
Acquisition (and related activities)	7	9

¹ Does not equal 100 percent due to rounding.

With respect to the “failure” rate, it is assumed that information is requested regarding default and loss rates. A few technical defaults have occurred on Section 108 loans, but no loss has ever been incurred by the Federal Government.

This does not mean that communities who use Section 108 funds to make loans to third parties (e.g., economic development loans) have not experienced defaults on those loans or incurred losses due to inadequate collateral. However, to the extent these losses created a shortfall in the amount necessary to service the Section 108 loans, that shortfall has always been covered by pledged CDBG funds.

In a survey conducted in 1998, the Department received more detailed information regarding the use of CDBG funds for 332 Section 108 projects funded between 1992 and 1997. Of the 332 projects surveyed, 202 were characterized as being for economic development assistance. Of these 202 projects, 39 involved the unplanned use of CDBG funds to make a required Section 108 Loan repayment and of these 39 projects, 30 were project-specific and 9 were revolving loan funds.

The 30 project-specific projects had 15 defaults or a calculated default rate from this survey for all economic development loans of approximately 7.4 percent. The 9 revolving loan funds funded 106 loans and had 16 defaults or an approximately 15.1 percent default rate.

For all of the 332 projects surveyed, loan advances totaled approximately \$1.116 billion. Advances for economic development assistance totaled approximately \$736.3 million.

The defaults for the economic development project-specific grants represented approximately 6.5 percent of the advances for economic development assistance and approximately 4.3 percent of all advances made by HUD between 1992 and 1998. These defaults can be attributed to factors that influence defaults on loans made by all private and public lenders. These factors are both endogenous (e.g., the business competence of the borrower) and exogenous (e.g., international trade policies that might adversely affect some lines of business). However, given that Section 108 assistance can only be used where communities have been unable to obtain financing without the Federal guarantee and are frequently carried out in distressed areas, the default and loss rates disclosed by the survey are not out of line.

COMMUNITY BUILDERS

Question. Please identify the number and function of community builders by office. Please identify all costs associated with the program, including salaries, education expenses, and travel expenses. Please provide the legal opinion and the hiring requirements used.

Answer. As of June 19, 1999, there were 784 Community Builders currently employed, which included 376 internal and 408 external hires. Of the total external hires, 78 are Community Builder Specialists, who are located in select program cylinders.

The grade levels of Community Builders are: GS-7/12 (Associate Community Builders); GS-13/15 (Career Community Builders); and GS-13/15 (Community Builder Fellows).

In fiscal year 1998, the Department spent \$576,000 in travel funds in support of its Community Builder Program. In fiscal year 1999, the Department has spent \$1,098,785 through June 21, 1999, in travel funds to support the program. In fiscal year 2000, approximately \$87 million is expected to be spent by Community Builders as follows:

Salaries & Benefits	\$82,620,000
Travel	1,800,000
Training	2,783,500
Total	87,203,500

There are four types of Community Builders: Senior Community Builder (GS-14/15—career); Community Builder (GS-13/14/15—career); Community Builder Fellow (GS-13/14/15—term appointment); and Associate Community Builder (GS 7/9/11/12—career). The Senior Community Builders, Community Builders, and Associate Community Builders are all career employees. The Community Builder Fellows are all term employees with a 2-year term appointment. They are eligible for a second 2-year appointment at the discretion of HUD management. The authority and duties of Community Builders are as follows:

General Description

In the past, HUD employees were asked to be facilitators as well as monitors. These dual responsibilities were inconsistent or contradictory. As many HUD watchers have noted, the demand that HUD employees provide helpful, timely and responsive customer service while at the same time acting as tough, detail-oriented regulators, monitors and referees was unrealistic and led to increase vulnerability to waste, fraud and abuse in HUD programs. A top priority in reforming HUD—as suggested by both the GAO and HUD's Inspector General—was to focus the attention of HUD employees on monitoring HUD programs to ensure that they are well run and on ensuring compliance with HUD regulations. Only by removing the customer service functions and giving them to Community Builders was HUD able to effectively focus the rest of its employees on monitoring and compliance. Thus, the position of the Community Builder was created because HUD realizes that both roles have a place in the Department, but that they are distinct functions which are better performed by different individuals—in different divisions—within the HUD organization. With the creation of the Community Builder cadre of employees, there is now, for the first time at HUD, a separation between customer service and program monitoring/enforcement functions. Community Builders provide direct customer service which addresses real community needs. All other HUD employees, known as Public Trust Officers, are responsible for program monitoring, compliance and enforcement. This division of responsibilities, Booz-Allen & Hamilton concluded, “enables HUD to focus its training and development efforts on enhancing each group's capacity to more effectively perform its assigned role.”

The primary responsibilities of all Community Builders are to serve as HUD's links to communities, assisting them in identifying their local needs through HUD programs. Community Builder customers include, but are not limited to, taxpayers, homebuyers, renters, homeless people, state and local government, housing authorities, lenders, mortgage bankers, home builders, realtors, not-for-profit organizations, and the faith-based community.

Senior Community Builder (SCB)

The Senior Community Builder (SCB) is the head of a field office and coordinates the accomplishment of program and management priorities included in the office's Business and Operating Plan. The SCB, who reports to the Secretary's Representative, has direct line authority over the Community Builders, Community Builder Fellows (CBF), Associate Community Builders (ACB), and related support staff in

the area of Labor Relations. In addition, the SCB manages the work of field Environmental Specialists, even though these positions are organizationally part of the Office of Community Planning and Development. The primary duties of the Senior Community Builder are to:

- represent the Department for all programs within the office's geographic jurisdiction;
- serve as the Department's liaison with state and local officials, private sector organizations and public interest groups;
- coordinate the development and implementation of the Business and Operating Plan for their geographic jurisdiction; and
- evaluate the efficiency and effectiveness of HUD programs within their jurisdiction.

Community Builders

Community Builders serve as the initial point of contact for all elected officials and the critical link for HUD customers to access the full range of HUD programs and services. They serve on the staff of the Secretary's Representative or Senior Community Builder (SCB). Community Builders serve as HUD's outreach arm to communities, and work to achieve the goals and objectives contained in the local Business and Operating Plan (BOP). Community Builders provide a wide variety of services to communities and customers in their jurisdiction, but have no role in the preparation, review or approval of applications for HUD assistance. Their work is done in collaboration with Public Trust Officers (PTOs). The work of Community Builders is guided by the Department's new focus on community consulting and collaboration, community-focused planning, fostering neighborhood-based empowering partnerships, building local capabilities for problem solving, and facilitating the development of comprehensive and integrated service strategies within the community and at HUD. Community Builders are responsible for:

- representing HUD at public events; educating customer groups and the general public on HUD issues and priorities;
- educating and explaining HUD programs and special initiatives;
- performing a broad variety of marketing, liaison and related community activities on behalf of the Offices of Housing, Public and Indian Housing, Community Planning and Development, Fair Housing and Equal Opportunity, and the Real Estate Assessment Center (REAC), the Departmental Enforcement Center (DEC) and the Office of Multifamily Housing Assistance Restructuring (OMHAR);
- assisting in the development of field office BOPs;
- monitoring the Plan's implementation and promoting timely and effective cross-program coordination in carrying out BOP implementation at the local level;
- organizing and marketing all Notice of Fund Availability (NOFA) and SuperNOFA training sessions to clients and prospective grantees;
- providing information and consultative services to communities to solve problems;
- identifying community needs and assessing community assets and resources to promote HUD's strategic objectives—fight for fair housing; increase affordable housing and homeownership; reduce homelessness; promoting jobs and economic opportunity and empowering people and communities;
- assisting agencies and community organizations in developing comprehensive community development and housing priorities and strategies;
- collaborating with community organizations and providing technical assistance to foster local public/private partnerships to achieve community goals and to develop local capabilities to achieve those goals;
- providing leadership in responding to natural disasters and implementing special Departmental initiatives;
- consulting and coordinating with other Federal and state agencies on housing and community development initiatives;
- organizing HUD's response to controversial local issues; meeting with special interest and advocacy groups to discuss their issues and concerns; coordinating and facilitating meetings between HUD program specialists and advocacy groups;
- assessing HUD customer service performance and the impact of programs in addressing local needs through regular meetings with housing industry, community and government organizations; and
- identifying and addressing customer service and program delivery deficiencies through communication and coordination with Secretary's Representatives, Senior Community Builders and appropriate program office officials.

Community Builders Fellows

Community Builder Fellows serve on the staff of the Secretary's Representative or Senior Community Builder (SCB). The authority and duties of Community Builder Fellows (CBFs), who serve on a 2-year term appointment, are identical to those described above for career Community Builders. The primary difference is that they bring to the job a non-HUD perspective, expertise and experience in solving local housing and community development problems. Working collaboratively with career Community Builders and Public Trust Officers, the Community Builder Fellows will augment the knowledge of community needs and resources and enhance the capacity of HUD staff to be more effective partners with communities in finding practical solutions to local issues. In addition to the general Community Builder Fellows, the Department has hired Community Builder Fellows who are Specialists in particular program areas or initiatives.

Associate Community Builders

Associate Community Builders (ACBs) serve on the staff of the Secretary's Representative or Senior Community Builder (SCB) in all HUD field offices. They provide a broad-range of administrative and clerical support to the SCB, Community Builders and Community Builder Fellows assigned to the office. Associate Community Builders are responsible for:

- serving as the initial point of contact for telephone inquiries and “walk-in” customers and being a source of general information on HUD programs and services;
- providing support in resolving customer complaints and analyzing customer service trends;
- assisting in the development and updating of community profiles;
- assisting in the preparation of Business and Operating Plan progress reports; and
- supporting the Community Builders and Community Builder Fellows on a broad range of tasks related to outreach for HUD programs and services.

Community Builders were hired to meet Departmental human resource requirements. Hence, a legal opinion was not required to justify the hiring of this staff. Attached is a listing of Community Builders, by office.

STAFFING

Question. There are major staffing issues in how HUD has allocated resources. Please describe how staff resources have been allocated by function and office over the last 3 years as well as a cost-benefit analysis for all staff decisions.

Answer. Recent allocations of staff are done pursuant to the HUD 2020 plans and other reorganizations within each component organization. All staffing actions are reviewed by each Assistant Secretary and by the Deputy Secretary's office. These staffing actions are reviewed to ensure that the Department maintains and improves its current capabilities and is positioned to effectively leverage the current workforce to meet changing needs.

In 1997, HUD announced its plan to implement a Resource Estimation and Allocation Process (REAP) that would link resources to results as required by the Government Performance and Results Act (GPRA). Congress asked the National Academy of Public Administration (NAPA) to conduct a study of HUD's procurement activities and practices for estimating human resource needs. The scope of the study was later increased to include review of HUD's compliance with GPRA. In 1998, the Academy developed plans to demonstrate a method which would estimate, allocate and validate resources. In 1999, NAPA reviewed the results of pilot demonstrations conducted in Housing and Community Planning and Development and developed

formal recommendations for HUD. The Department will begin utilizing the results of the pilot in fiscal year 2000.

EMERGENCY CDBG FUNDING

Question. The fiscal year 1999 supplemental appropriations transferred authority for allocating emergency disaster funds for unmet disaster needs from HUD to FEMA. Nevertheless, the subcommittee remains concerned over HUD's oversight on the use of the emergency funds that have already been allocated. Please provide a description of all oversight actions taken by the Department. For example, Grand Forks, North Dakota received over \$200 million in fiscal year 1997 funds. There is anecdotal evidence that a large number of houses have been built through a buy-out program but remain unoccupied. Please provide a status report of all funds allocated in fiscal years 1996 and 1997 under the emergency CDBG program.

Answer. HUD carries out oversight of CDBG supplemental disaster appropriations principally through review of the grantees' performance reporting via HUD's web-based Disaster Recovery Grant Reporting (DRGR) system and monitoring visits. In the case of Grand Forks, North Dakota, HUD recently completed a month-long monitoring visit and the HUD field office staff is in the process of writing a report on that visit. There are a number of issues that came up as a result of the monitoring visit that are being addressed with the city.

With respect to the anecdote about a large number of houses being built in Grand Forks and remaining unoccupied, this is what HUD's oversight found. What is called the Congressional Subdivision includes 189 newly constructed houses. The houses sell between \$90,000 to \$124,000. New houses in the area sell for a median sales price of \$130,000.

Sixty-five of the houses had been sold as of June 17, 1999. Offers have been made for an additional 53 of the houses, pending applicant approval. The remaining 71 houses are in various stages of construction. The city has mounted a vigorous marketing effort to sell the remaining houses as quickly as possible, including a radio campaign. The location of the development outside of the traditional city boundaries (i.e. on the west side of the Interstate, versus the traditional location of Grand Forks on the east side) has been somewhat of an issue in convincing residents to relocate to the new development. This location, however, is further from the Red River and much less likely to be affected by flooding.

Attached is a status report of CDBG disaster grants funded by appropriations under the Omnibus Consolidated Rescissions and Appropriations Act of 1996 (Public Law 104-134) and by the 1997 Emergency Supplemental Appropriations Act for Recovery from Natural Disasters, and for Overseas Peacekeeping Efforts, Including Those in Bosnia (Public Law 105-18).

NEW INITIATIVES

Question. HUD's budget request for fiscal year 2000 includes over 19 new programs and initiatives with funding of \$731 million. Many of these initiatives and activities, such as the redevelopment of abandoned programs and Metro Job Links, can be handled under such broad programs as the CDBG program. Why not let states and localities decide their own funding priorities?

Also, there are significant concerns about HUD's capacity to administer its core programs. Has HUD conducted a staffing evaluation on staffing and capacity to ensure that these new initiatives will not reduce HUD's ability to meet its own program responsibilities? Please provide a review of the staffing needs created by these proposals and how HUD plans to address these concerns?

Answer. Although HUD's budget requests increases in virtually every existing program, the only funds being requested for new programs are for HUD's participation in new administration initiatives—APIC, Regional Connections and Abandoned Buildings. Other increases are for expansions of initiatives within existing programs or programs we have requested previously. In many cases, our initiatives only represent refocusing of resources to meet evolving needs within existing programs.

Local development needs are so great that even without set-asides the demands for housing and community development funding would exceed that which is available under the CDBG and HOME programs. If the set-asides proposed in fiscal year 2000 were divided among all CDBG and HOME recipients, the additional funding per community would be relatively small. Providing set-asides within these broad programs enables localities with demonstrated capacity to acquire a sufficient amount of extra funding to finance critical targeted activities that would otherwise be "crowded out" by local demands for more general housing and community development activities. This facilitates the creation of "best practices" and national models. Once the success of these activities is proven communities across the country are more likely to adopt them as a part of their regularly-funded CDBG and HOME activities. Since funding under these programs is awarded competitively, it is the communities, not HUD, that determine the activities to be a priority.

By and large, all funding increases are designed to go directly to local communities and their partners, thus, they require minimal additional staff resources for HUD. The staff resources necessary to manage the three new programs, as well as the initiatives embedded or connected to existing programs are extremely modest. These staffing resources are estimated at less than a quarter of 1 percent of HUD's total S&E resources.

Finally, we want to restate as per our letter of March 11, 1999 that the Department proposes to redirect funding requested for Metro Job Links to remain within the CDBG account but to be used instead to fund the successful SHOP program. The Department is also proposing that the \$25 million earmarked for the Regional Affordable Housing Initiative within the HOME program be used for other purposes, with \$17.5 million of the funding to be provided as regular HOME formula funding and \$7.5 million of the setaside to provide funding for Capacity Building for Habitat for Humanity. The sole intent and impact of this change in policy is to provide funding for already proven effective housing programs supported in the past by both the Department and the Congress.

The requested funding as set-asides within such programs as Community Development Block Grants reflects the priority of these efforts, the desire to establish "best practices" and national models. In addition, programs such as the Community Development Block Grant and HOME Program provide funding for housing, economic development and other flexible local needs but the available funding is far outstripped by the demand. The requested set-asides allow localities to address priority efforts that would otherwise be "crowded out" by the shortfall in funding for more general housing and economic development efforts.

HUD SECTION 8 PROJECT-BASED INVENTORY

Question. What is the physical status of HUD's Section 8 Project-based inventory? How many projects have been reviewed and what is the status of these projects? How many projects have failed to meet HUD's Housing Quality Standards (HQS)? What are the procedures for projects that fail HQS and how many projects have been terminated from section 8 for failing HQS?

Answer. HUD Section 8 Project-based inventory includes 22,000 properties receiving project-based Section 8 rental assistance. Last year, utilizing state-of-the-art technology and a carefully designed system of performance indicators, REAC began the process of conducting the first-ever complete inspection and assessment of Federally subsidized housing. To date, REAC has inspected over 6,022 multifamily properties and is on track to complete the baseline inspection of all 22,000 project-

based section 8 properties by 1999 year-end. The vast majority of properties are in good physical condition. Overall, the inspection results show that 80 percent of the project-based Section 8 properties are in acceptable physical condition, 17 percent are in poor condition, and 3 percent are in unacceptable condition. The physical condition of these projects is summarized below.

<i>Condition</i>	<i>Number of Projects</i>
Unacceptable Condition—Potential Referral to Enforcement Center	188
Poor Condition—Need HUD Monitoring	1,027
Acceptable Condition	4,807

HUD believes that all its housing, regardless of the subsidy or assistance source, should be assessed using uniform physical condition standards. The REAC Physical Inspection protocol covers virtually all facets of HQS inspection and is both more objective and considerably more defined in identifying and classifying deficiencies. It includes 60 types of items to be inspected and about 400 potential deficiencies. With consistent criteria defined for each possible defect, HUD can be sure that its grades for housing quality really mean what they say.

All the section 8 properties with REAC score of 30 or below are referred to the Enforcement Center for evaluation. So far, no section 8 contract has been terminated due to low REAC score. However, they are under advisory notice. Projects scoring above 30 but less than 60 are required to make needed repairs within 90 days—when feasible—or provide the local HUD Multifamily office with a plan for remedial action. Field offices then monitor the completion of repair over time. Life threatening health and safety violations discovered as part of the REAC inspection must be repaired or mitigated within 72 hours. Lastly, projects with scores above 60 are considered to be in acceptable condition, and no further action is required. There are some exceptions such as reports from Community builders, local press articles, results of routine , management visits, tenant complaints, or similar subsequent events trigger the need to request a reinspection.

FANNIE MAE/FREDDIE MAC

Question. How many people currently are employed in HUD's Office of Government Sponsored Enterprises? What are their responsibilities? How is the \$10 million request justified?

Answer. HUD's Office of Government Sponsored Enterprises Oversight, working under the direction of the Assistant Secretary, Office of Housing, employs five full-time staff to administer the Secretary's programmatic authorities under the Federal Housing Enterprises Financial Safety and Soundness Act of 1992 (FHEFSSA) and to coordinate the work of an interdisciplinary team of HUD Offices charged with carrying out the Secretary's mission oversight responsibilities with regard to Fannie Mae and Freddie Mac (the GSEs). In addition to Office of Housing staff, this interdisciplinary team is comprised of staff from the Office of Policy Development and Research, the Office of General Counsel, and the Office of Fair Housing and Equal Opportunity. In fiscal year 1998, HUD spent approximately \$3.4 million for 16.9 full-time equivalent inter-Office HUD staff which, collectively, carry out mission regulation under FHEFSSA.

With regard to responsibilities, HUD's inter-Office staff develop and implement regulations which establish the GSEs' affordable housing goals under FHEFSSA. In addition, to achieve statutorily mandated objectives, staff carry out broad oversight functions that include: monitoring performance of the GSEs in meeting the housing goals; enforcing compliance with the goals; reviewing new GSE programs; monitoring the GSEs for consistency with fair lending statutes; developing and managing mortgage finance and housing market research and analysis to ensure effective targeting of the GSE housing goals; monitoring non-mortgage investments for consistency with public purposes; and monitoring affordable housing performance trends to determine impact of the housing goals on the GSEs' operations and on the public. The attached letter to Valerie Baldwin, who is on the staff of the House Appropriations Subcommittee on VA, HUD and Independent Agencies, contains additional discussion regarding key areas of HUD's regulatory responsibilities. Also attached is a budget justification, dated January 6, 1999, which sets forth the Department's regulatory initiatives relevant to mission oversight and the estimated costs of this regulation for fiscal year 2000.

HUD is proposing this assessment on the GSEs in order to recover the cost of regulating these entities. This approach is consistent with a long-established and standard practice for the Federal government to charge the financial institutions it regulates for the costs of that regulation, rather than have the taxpayers bear the cost. For example, the Office of the Comptroller of the Currency, the Office of Thrift

Supervision, and the National Credit Union Administration all assess the financial institutions within their purview for the costs of regulation. Similar arrangements exist with respect to the GSE regulatory work of the Federal Housing Finance Board and the Farm Credit Administration. Even within HUD, the Office of Federal Housing Enterprises Oversight was granted the authority in 1992 to assess Fannie Mae and Freddie Mac for costs of ensuring safety and soundness, but the law did not apply the same principle to HUD's mission regulation of the GSEs. It is time to eliminate that anomaly.

PREPARED STATEMENT FROM HAL C. DECELL, III

I want to take this opportunity to amplify the Department's thinking with respect to the proposal contained in the fiscal year 2000 budget to allow HUD to assess Fannie Mae and Freddie Mac for the costs of mission regulation. As you know, the budget proposes that the Secretary be granted authority to charge the Government-Sponsored Enterprises for these costs, up to an aggregate of \$10 million per fiscal year. Legislative language to effect this change to the 1992 Act has been submitted. Congress has charged HUD with important oversight responsibilities which include setting and enforcing GSE housing goals, reviewing new GSE programs, monitoring the GSEs for consistency with fair lending statutes, and other tasks noted below. HUD's mission regulation is needed to ensure that the GSEs offer their benefits fairly to all citizens and all areas of the nation.

First, let me review the philosophy underlying this proposed change. It has been a long-established and standard practice for the Federal government to charge the financial institutions it regulates for the costs of that regulation, rather than have the taxpayers bear the cost. For example, the Office of the Comptroller of the Currency, the Office of Thrift Supervision, and the National Credit Union Administration all assess the financial institutions within their purview for the costs of regulation. Similar arrangements exist with respect to the GSE regulatory work of the Federal Housing Finance Board and the Farm Credit Administration. Even within HUD, the Office of Federal Housing Enterprise Oversight was granted the authority in the 1992 Act to assess Fannie Mae and Freddie Mac for costs of ensuring safety and soundness, but the law did not apply the same principle to HUD's mission regulation of the GSEs. It is time to eliminate that anomaly.

Secondly, HUD's proposal would allow for a much-needed expansion of HUD's capability to meet its mission-related regulatory responsibilities. For fiscal year 1999 the Department projects expenses of about \$3.5 million for mission regulation, a tiny percentage of the GSEs' combined annual net income of \$5.1 billion in 1998. The expanded effort would concentrate on the following key areas:

Monitoring performance of the GSEs in meeting their affordable housing goals

With new GSE affordable housing goals expected to be in place shortly, the Department needs to expand its capability to provide accurate and timely review of GSE performance. A key component of this effort will be greatly increased monitoring to ensure that the transactions properly qualify for goal counting purposes, as well as verification of the loan level data provided to HUD by the GSEs.

Fair lending

HUD has begun to step up our oversight activities to ensure that the GSEs are not discriminating in their mortgage purchases, as prohibited under both the 1992 Act and the Fair Housing statutes. We aim to ensure that GSE business practices including automated underwriting do not discriminate on any unlawful basis. This will be a major focus of our attention in fiscal year 2000.

Mortgage Finance and Housing Market Research and Analysis

In the rapidly changing environment of mortgage finance, it is vital for the Department to keep abreast of new developments, and to understand their short and long term implications. Expanded research will help the Department exercise its mission regulation authority wisely with a view to effectively targeting the GSE housing goals and thereby expanding credit availability and housing affordability throughout the nation.

Non-mortgage investments

We plan to enhance our monitoring of the GSEs' non-mortgage investments and activities to ensure that they are consistent with the public purposes stated in the GSEs' Congressional charters. The Department needs strengthened financial expertise to support its mission oversight efforts in this area.

New Business Activity and Program Reviews

The Department is responsible for reviewing GSE new program requests to ensure that they are in the public interest and consistent with the GSEs' Congressional charters. Additional funds will allow the Department to strengthen its monitoring of GSE business activities and, as appropriate, to review them as new programs in accordance with the 1992 Act.

This expansion would apply across the various categories of mission regulation expense-staff salaries and benefits, research, and contractor support for data analysis. The Office of Housing, the Office of Policy Development and Research, the Office of General Counsel, and the Office of Fair Housing and Equal Opportunity would all incur additional expenses. HUD will establish a separate account which will keep track of all amounts spent on GSE oversight.

In summary, the Department strongly believes that the GSEs, not the taxpayers, should bear the costs for HUD's mission regulation. The proposal is consistent with the way in which OFHEO and other Federal financial regulators are funded, it is fiscally prudent, and it would, for relatively small costs assessed against the GSEs, permit a needed strengthening of HUD's capacity to assure that they fulfill their charter objectives.

We would be happy to meet with you at your convenience to provide more detail and to answer your questions.

MEMORANDUM

MEMORANDUM TO: Michael Deich, PAD, OMB

FROM: Richard F. Keevey, CFO HUD

RE: Justification for Increase in HUD's Budget for Oversight of Fannie Mae and Freddie Mac

DATE: January 6, 1999

Per your request we have reviewed our current and expected expenditures relating to HUD's oversight of the GSEs. What follows fully explains and supports the estimated \$10 million in fees that will be required to carry out our mission in fiscal year 2000.

In fiscal year 1998, HUD spent approximately \$3.4 million, involving 16.9 full-time equivalent HUD positions, \$1,065 thousand for research contracts and, \$262 thousand for computer support contracts on oversight of Fannie Mae and Freddie Mac. These estimates were included in a recent GAO Report "Federal Housing Enterprises: HUD's Mission Oversight Needs to be Strengthened" "As the title suggests, the GAO report concluded that HUD implementing its oversight responsibility. The Department has indicated in Congressional testimony that it is committed to allocating additional resources to enhance its regulation of these government-sponsored enterprises (GSEs). In order to fulfill that commitment, it is essential that HUD's outlays for GSE—oversight be funded by assessments on the GSEs.

Specific initiatives that the Department will undertake or areas where it will expand upon its current oversight activities are listed in the following table. Due to the short deadline, we have made accurate estimates of the cost to accomplish the individual initiatives listed but have not broken out the costs as to whether they would involve contract dollars and additional staff resources. Further, the estimated additional costs have not been allocated among Housing, PD&R, OGC, and FHEO, all of whom are involved in GSE oversight activities and participated in developing these activities.

Initiative	Estimated additional cost
Fair Lending. Increased analysis and oversight of the GSEs underwriting practices from a fair lending perspective. This analysis would include assessing the impact of underwriting standards (automated and traditional), business practices, repurchase requirements, pricing, fees and procedures that affect the purchase of mortgages to ensure that they do not have a disparate impact on protected groups. Also, to pursue fair lending investigations with the assistance of the GSEs and carry out other fair lending requirements of the 1992 GSE Act	\$1,500,000
Data Verification. Review and verification of the accuracy of the loan level data on mortgages purchased by the GSEs that are provided to the Department for purposes of monitoring compliance with the housing goals	1,000,000

Initiative	Estimated additional cost
New Program Threshold Reviews. Increased monitoring and more proactive evaluation of the GSEs' operations to identify and assess new activities as possible new programs requiring review; i.e., identifying and analyzing individual business activities to determine whether they meet the new program criteria	600,000
Additional Support for New Program Reviews. Obtain necessary specialized expertise to assist in analyzing new programs identified and submitted by the GSEs. Additional staff support to conduct new program reviews	750,000
Non-Mortgage Investments. Enhanced monitoring of the GSEs' non-mortgage investments and activities to ensure that they are consistent with their public purpose missions and charters. This monitoring includes regular and on-going analysis of their non-mortgage investment policies and portfolios	500,000
Affordable Housing Performance Trends. Analyze and monitor performance trends of the GSEs' mortgage loan portfolios to determine impact of housing goals on GSEs operations	500,000
Enhanced Goal Performance Monitoring. Increased goal performance monitoring and analysis of trends in GSE mortgage purchases Research	500,000
Research. Expanded research on the impact of the housing goals on housing affordability	500,000
Special Studies. On-going research on the GSE's trends as they relate to industry trends and issues such as subprime lending, multifamily securitizations and trends, manufactured housing, rural housing, automation in mortgage banking, lending to minorities and impact of housing counseling on homeownership	500,000
Training and Additional Resources. Training for staff and resources for monitoring GSE and mortgage market trends and activities	250,000
Total additional expenditures	6,600,000
Total current expenditures	3,400,000
Total proposed budget for GSE oversight	10,000,000

STAFFING

Question. The Secretary has proposed reducing the staffing at HUD to 7,500. However, recently staffing has been increasing towards the 10,000 FTE level without justification or a cost-benefit analysis. Please provide a staff needs analysis by office and function.

Answer. The goal of reducing HUD's S&E staffing level to 7,500 FTE by 2000 was announced in 1994 by then Secretary Henry Cisneros. This staff level was deemed achievable only if Congress passed proposed legislation to consolidate 60 major programs into three performance-based accounts—a Community Opportunity Fund, an Affordable Housing Fund and the Housing Certificate Fund. It would also require transforming the Federal Housing Administration (FHA) into a government corporation, streamlining HUD program operations throughout the Department and reducing the number of field offices from 81 to 60. Congress has not enacted most of these proposals and most of the other initiatives are in various stages of development and/or implementation. Subsequently, Secretary Cuomo made the decision not to close any of HUD's field offices. Also, in May 1998, Secretary Cuomo publicly announced to Congress that without Congressional action on HUD's legislative proposals for program consolidation, a more appropriate staffing level for the Department would be approximately 9,300 FTE.

The 7,500 FTE level established in 1994 was for Salaries and Expenses (S&E) employees only. The referenced 10,000 current staffing level appears to include staff from the Office of Inspector General, the Office of Federal Housing Enterprise Oversight, and the Working Capital Fund. As of July 3, 1999, the S&E staffing level was 9,200.

It is anticipated that a staff needs analysis by office and function will be a product of the new Resource Estimation Allocation Process (REAP) which is discussed in further detail in the previous staffing response. This type of information will be available upon completion of 1 full-year utilizing REAP, i.e., from initial resource estimation through allocation and validation.

The Department's fiscal year 2000 budget justification, submitted to the Congress in February 1999, includes the following staffing assumptions.

FULL-TIME EQUIVALENT (FTE) EMPLOYMENT

[Excludes Overtime and Terminal Leave]

	Estimate fiscal year		Increase or de- crease ¹
	1999	2000	
Salaries and Expenses, HUD	\$9,386	\$9,383	— \$3
Other Funds	1,182	1,195	+ 13
Total, HUD FTE	10,568	10,578	+ 10

¹ Fiscal year 2000 vs. fiscal year 1999.

Note: Other funds include Working Capital Fund, Office of Inspector General, and Federal Housing Enterprise Oversight.

These staffing estimates are consistent with the overall program proposed for HUD, and with the detailed budget justifications for individual program activities, which were submitted to the Congress as part of the fiscal year 2000 budget.

Moreover, these estimates should be viewed in the context of the longer term trend where total HUD staffing has declined significantly. The total HUD staffing level of 10,578 FTE for fiscal year 2000 is a reduction of 25 percent from the level of 14,073 FTE in fiscal year 1992. Similarly, the Salaries and Expenses, HUD account staffing level of 9,383 FTE for fiscal year 2000 is a reduction of 29 percent from the level of 13,167 FTE in fiscal year 1992. For comparison, these staffing reductions are taking place while HUD's outlays are projected to increase by 33 percent from fiscal year 1992 to fiscal year 2000.

Also, HUD's staffing can be viewed in the context of broader, governmentwide employment trends. HUD's 25 percent staffing reduction from fiscal year 1992 to fiscal year 2000 is taking place while, over the same time period, Executive Branch civilian employment is decreasing by 16 percent and, excluding the Department of Defense, total civilian agency employment is decreasing by less than 4 percent. (The historical comparisons of HUD outlays, Executive Branch civilian employment, and civilian agency employment are found in Historical Tables that accompany the Budget of the United States Government, fiscal year 2000.)

HUD's current staffing levels must reflect programmatic needs and reflect current policies and programs, as legislated by the Congress. Future reductions in HUD's staffing levels will depend on improvements in the housing portfolio, with commensurate reductions in the number of troubled properties, and will depend on future Congressional legislation to modify HUD mandates. HUD will continue to work cooperatively with the Congress to consider ways to attain these critical prerequisites for making future staffing reductions.

PUBLIC HOUSING COSTS

Question. What are the actual costs needed to administer public housing as opposed to the current funds provided through formula?

Answer. The current Performance Funding System (PFS) for public housing is based on the operating expenses of a well-managed Public Housing Authority (PHA) in 1974, updated to reflect changes in inflation, and with additional funding provided for costs of employee benefits and insurance. Utility costs are now handled separately with actual utility costs forming the basis for HUD subsidy in this area. Under this system, HUD provides subsidy to PHAs to make up the difference between PHA income, principally tenant rent, and the amount of funds needed to bring the PHAs up to their Allowable Expense Levels under the PFS and pay for utilities.

Under this system, most PHAs are operating at a satisfactory or higher level of performance and have operating reserves of 40 percent or more. Obviously, the system provides a reasonable level of funding for most PHAs, and pays for the actual costs PHAs are incurring in running their public housing.

There is interest in the PHA community in exploring a system that is based on the actual cost to a PHA of undertaking the range of activities associated with operating public housing, including administration, maintenance, security and tenant services. This approach would call for setting standards for conducting each of the activities, input measures, and determining the cost of the activities. Standards and costs using this approach have not been established by HUD. A long-term study would be needed to develop this information.

Question. Because of the new flexibility provided to PHAs in the fiscal year 1999 Appropriations Bill, how much less funding will PHAs need to operate?

Answer. The fiscal year 1999 Appropriations Bill provides new flexibility to PHAs in many areas, including admissions, and rent-setting. It encourages admission of families with a wide-range of incomes and provides for PHAs to establish incentives to help move resident households from welfare to work. Over time this could result in higher tenant rents, and thus in lower subsidy needs. At the same time, the fiscal year 1999 Appropriations Bill mandates new responsibilities on PHAs, so that overall PHA operating costs are not expected to decline.

Question. Please provide a salary analysis of staffing by each PHA?

Answer. HUD does not collect this information, since HUD does not review and approve PHA salaries, believing that would be micromanagement of this program.

Question. How do costs of operating public housing compare with privately owned rental housing?

Answer. It is not possible to directly compare public housing costs with the costs of privately owned rental housing for several reasons.

First, public housing costs include elements not found in the private sector, such as the extensive administrative costs associated with required functions such as verification of tenant income, rent-setting based on income, lease and grievance requirements, planning and reporting requirements, and the need to arrange for the provision of services to residents. Private housing costs do not usually include these requirements, but do include elements not found in public housing, such as property taxes and principal and interest on debt financing for the housing. Thus, the costs are not comparable, and a number of assumptions and adjustments must be made to attempt to compare them.

Second, data for public housing is generally available by PHA, that is for the entire aggregate of projects. The private sector data is reported on a project-by project basis. To compare the two would require the development of a "synthetic PHA," aggregating data for a number of projects.

Third, available private sector data is limited and reported voluntarily, and therefore may or may not reflect actual costs in the market place.

Given these constraints, we do not think it is possible to compare public housing and private rental housing costs in any meaningful way.

A fuller discussion of these issues is contained in Chapter 3, "Alternative Funding Systems: A System based on Private Market Operating Costs," of the HUD report *Revised Methods of Providing Federal Funds for Public Housing Agencies: Final Report*, June 1994. (copy attached)

[CLERK'S NOTE.—The HUD report "Revised Methods of Providing Federal Funds for Public Housing Agencies: Final Report," can be found in the subcommittee files.]

MARK-TO-MARKET

Question. I remain concerned about the progress the Office of Multifamily Housing and Assistance Restructuring (OMHAR) has made in developing and implementing the Mark-to-Market Program. I cannot stress enough how important this program is to residents and communities and that the implementation of Mark-to-Market will be one standard that many in Congress will be measuring the Department's credibility in its management reform efforts. What is your expected timeline in completing negotiations with the state HFA's?

Answer. We have made tremendous progress in implementing the Mark-to-Market program. As of today, we have agreements with 19 public housing finance authorities, including Missouri, and expect to have agreements with another 13 within the next month. We have been consulting with state and local housing finance authorities for over 6 months. This consultative process resulted in the development of important documents such as the operating guide and a generic contract (called a Portfolio Restructuring Agreement, or PRA) for use by public entities participating in our program as a PAE (or Participating Administrative Entity). A high priority for the past several months has been the negotiation and signing of PRAs with individual state and local housing authorities and, thereafter, the actual assignment of properties for restructuring. We are continuing to make every effort to successfully negotiate contracts with interested state and local HFAs. No deadline on such discussions exists and none will be established to curtail our efforts to sign public PAEs. At the same time, we remain cognizant of our responsibility to manage this important program to restructure low-income residential properties for the benefit of tenants, owners and taxpayers and we will take appropriate and necessary actions to assure that properties in our program are restructured without inordinate delay.

As of today, approximately 500 properties are in our portfolio available for restructuring. With these actions and with the actions detailed below, approximately 400 of these properties will be assigned for restructuring.

Question. Has OMHAR begun discussions with the private sector entities that have qualified for the program?

Answer. With OMHAR's emphasis on signing contracts (PRAs) with public entities, it has had only limited discussions with private sector entities (including nonprofit organizations). However, we had only recently engaged in a formal solicitation to award assets. Contracts to three firms were awarded through a competitive bidding process.

There were several reasons for this. Among them, there are states in which a housing finance authority decided not to become a PAE. These include: Alaska, Arkansas, Hawaii, Kansas, Mississippi, Montana, Nebraska, Nevada, and Wyoming.

OMHAR has also awarded properties for restructuring to private PAEs under special circumstances. In two cases, we were told by the state that, although they were still interested in being a PAE, their organization needed more time to process the contract and receive approval from their respective Boards. Here, with the informal assent of these states, we awarded a limited number of assets in order to give them the time they needed.

In one other case, OMHAR has awarded a contract to a PAE during lengthy but, to date, inconclusive discussions with a potential public PAE due to the rapid accumulation of properties eligible for immediate restructuring that became a matter of mutual concern to both OMHAR and the potential PAE. To address this urgent situation, and faced with the prospect of an anticipated deluge of additional properties, OMHAR took the measured step of assigning a portion of the backlog of properties to a nonprofit organization for immediate restructuring. However, we reserved the number of assets which the PAE stated was its quarterly capacity in the event an agreement could be reached. The firm that was selected was a not-for-profit organization with significant experience in restructurings and with a history of valuing tenant and community relationships.

Question. What is the disposition of these discussions?

Answer. OMHAR is not involved in general or ongoing contract discussions with private sector entities. Our focus remains on signing PRAs, wherever possible, with public entities. The use of private sector organizations (including nonprofits) to date has been limited to the following instances:

- there is no public PAE in the jurisdiction and eligible properties await restructuring;
- a public entity has declined, or is unable, to participate as a PAE (i.e., some state laws operate to prevent potential public PAEs from complying with the terms of the contract, or for other reasons); or
- urgent and immediate attention is required, for problems such as the high volume of properties already in the pipeline and either no contract is in place to allow a public entity to provide restructuring services or the restructuring workload would strain and perhaps even exceed the resources and capabilities of the public entity.

SINGLE FAMILY PROPERTY DISPOSITION

Question. One of the areas of concern that the recent financial statement audit identified in FHA's single family property disposition program, Over a year ago, GAO revealed numerous case examples where HUD contractors were not securing or repairing foreclosed properties and HUD was failing to perform its basic oversight functions over the contractors. A recent NBC Nightly News "Fleecing of America" feature displayed the same problems that GAO had identified.

Here is a clear example of where HUD is not performing its basic functions and is acting as a bad landlord. I believe recent HUD OIG testimony illustrated clearly this problem. Instead of meeting HUD's REO mission to reduce its foreclosed inventory in a manner that (1) expands homeownership, (2) strengthens neighborhoods and communities, and (3) ensures maximum return to the mortgage insurance fund, HUD is doing the opposite. For example, HUD's foreclosed inventory has increased 70 percent from about 24,700 properties in 1996 to over 43,000 in 1999.

Because we realized HUD's current system was broken, we passed legislation in last year's appropriation to address this problem. What is HUD doing currently to address its foreclosed inventory both in property disposition and loss mitigation? Does HUD have any evidence that problems identified in the NBC feature are being resolved? Has FHA's foreclosure inventory and turnover rate gone down? Why or why not?

Answer. HUD's contracts for private sector Marketing and Management (M&M) contracts, which became effective in March of 1999, are expected to reduce the current problems with property inventories, and to mitigate losses by providing greater recoveries. The contractors, who receive their remuneration from a percentage of the

sales price, have a strong economic incentive to secure and maintain the properties, market them vigorously, and turn them around as fast as possible for as high a price as possible. These contracts are expected to reduce inventories by faster sales, and reduce losses to HUD by lower holding costs and by higher sales prices. While the number of single family properties in inventory increased by about 4,000 properties from the end of fiscal year 1998 through March 1999, the inventory is expected to start to decline by the end of 1999.

FHA is strengthening and expanding monitoring of the performance of property disposition activities under the M&M contractor. First, the M&M contractors have a strong financial incentive to maintain and turnover properties, since their fee is based on a bid percentage of the sales cost of the properties. Second, other contractors are monitoring the M&M contractors performance. Third, the Homeownership Centers (HOCs) are required to issue monthly reports on the activity in the areas for which they are responsible, including field checks of the contractors records, and on-site examination of a portion of the properties involved.

YEAR 2000

Question. In a recent Associated Press news article, issues were raised with a number of Federal government agency "Year 2000" or Y2K efforts. One of the agencies cited was HUD. According to this article, in August 1997, the government listed 231 computer systems at HUD as "mission-critical." However, since then HUD had dropped from 231 systems to 62. As a result, Y2K compliance jumped from 22 percent to 73 percent. Some of the systems reclassified by HUD was the Multifamily Data Warehouse, which was phased out last November without a replacement, and the Funding and Contracting System, replaced in March by the Grants Evaluation Management System. How does the Department define "mission-critical" in context of the Y2K problem?

Answer. A HUD application system is assigned Year 2000 "mission-critical" status if it supports HUD's mission to provide a decent, safe, and sanitary home and suitable living environment for every American. Specifically it includes the critical application systems that support the following strategic objectives:

- fighting for fair housing;
- increasing affordable housing and home ownership;
- reducing homelessness;
- promoting jobs and economic opportunity;
- empowering people and communities; and
- restoring public trust.

Question. Please explain why HUD dropped 169 formally classified "mission-critical" systems and what functions these dropped systems play in the Department's operations and management. Also, please explain if any of the dropped systems are still being used by the Department and if there are any plans to address their compliance needs.

Answer. Senator, the Associated Press was in error when making this statement. The 231 systems referenced earlier included both "mission-critical" and "non mission-critical" application systems. Since HUD established its application inventory in 1997, only 75 HUD systems were identified as "mission-critical." The Office of Management and Budget (OMB) defines "mission-critical" differently than HUD (OMB excludes systems that are "Being Built Compliant") and that is how the 62 systems (75-13 "Being Built Compliant") mentioned in your question were identified. HUD has completed the Renovation, Validation, and Implementation of its entire application inventory (mission-critical and non mission-critical) on or ahead of all OMB Year 2000 mandated goals. In addition, HUD has deactivated all "mission-critical" systems whose disposition was Phase Out-No Replacement or Phase Out-With Replacement.

FHA SINGLE FAMILY PROPERTY DISPOSITION

Question. New legislation was included in last year's appropriations to improve FHA's single family property disposition program. A significant component of the legislation is to enable communities to designate areas where a nonprofit or local government can negotiate an agreement with HUD for the bulk purchase and sale of all FHA foreclosed single family properties. What steps has HUD taken to engage nonprofit and government organizations in the process of implementing this new legislation?

Answer. FHA has been dealing with localities and non-profits on revitalization areas, and developing asset control areas. Currently, these organizations can buy HUD-held properties at a discount, and, by bulk purchases with simultaneous closings, qualify for greater savings than on individual properties.

Question. Given the important role of nonprofit organizations in the new program, has HUD given any thought to providing technical assistance to such entities?

Answer. HUD has several program areas involved with technical assistance, including the new Community Builder positions. FHA, as an insurance operation, would not appear to be the organization best suited to offer technical assistance.

Question. Has the Department examined ways that it might cooperate to share risk and thereby promote the goal of neighborhood stabilization?

Answer. FHA has tried over several years, without success, to achieve feasible risk sharing agreements. The Secondary Market Demonstration project, for which FHA is currently evaluating proposals, is a risk-sharing program with grants for \$10 million. Awards are expected to be made in about 60 days.

Question. The conference report also requested the Department to provide any statutory changes necessary to implement a comprehensive loss mitigation program. What is the Department's current thinking on this matter?

Answer. Current increases in loss mitigation activity indicate that the program is a success and that major legislative changes are not necessary. The loss mitigation activity, excluding preforeclosure sales, has gone from about 700 cases in 1997, to 4,400 cases in 1998, to an estimated 20,000 cases in fiscal year 1999. Fiscal year 1999 loss mitigation cases through May total over 13,000—over 20 percent of total single family claims to date.

Question. Will the Department be sending any statutory recommendations?

Answer. The Department is currently examining possible substantive legislative proposals, as part of the budget process, and will propose changes as needed. A proposal to raise the fiscal year 2000 MMI commitment limitation to \$140 billion, the same as contained in the fiscal year 1999 Emergency Supplemental, is currently under review.

FAIR HOUSING ACTIVITIES RE: PROPERTY INSURANCE

Question. In our past four Committee Reports on HUD appropriations, we have addressed the use of funds for enforcement of the Fair Housing Act against property insurers. We have repeatedly pointed out that the Fair Housing Act, while expressly applicable to landlords, real estate brokers, and mortgage lenders, makes no mention of property insurers or their business practices. In light of that, and because the statute's legislative history indicates that the law does not apply to insurance, we have urged that HUD not spend fair housing funds on activities relating to insurers. In particular, with respect to Fair Housing Initiatives Program—the "FHIP"—our Reports have stated that, in light of the limited resources available, FHIP funds should "be used only to address such forms of discrimination in the sale, rental, and financing of housing as they are explicitly identified and specifically described" in the Fair Housing Act. This statement clearly indicates that we intend that FHIP funds not be used for activities relating to enforcement of the Fair Housing Act against insurers. What steps has HUD taken to ensure compliance with our intent in this regard?

Answer. We understand the concerns of the Committee and are sensitive to them. As you know, however, HUD and the Department of Justice believe the Fair Housing Act (FHA) covers discrimination by property insurers. In implementing the Fair Housing Amendments Act of 1988, HUD issued regulations in 1989 making explicit that such insurance discrimination constitutes prohibited conduct. Since issuing these regulations, all circuit court decisions have supported the application of the FHA to property insurance discrimination and have not found the Department's interpretation inconsistent with the McCarran-Ferguson Act. *Nationwide Mut. Ins. Co. v. Cisneros*, 52 F.3d 1351 (6th Cir. 1995) (Kennedy, J., dissenting), cert. denied, 516 U.S. 1140 (1996). As HUD is required to enforce all provisions of the FHA, it must enforce the law with respect to insurance discrimination.

Moreover, individuals who believe they have suffered insurance discrimination continue to seek the assistance of organizations HUD funds through its competitive grant program. Requirements for the program are highlighted annually in the Notice of Funds Availability (NOFA). In light of the Committee's concerns, since 1997, FHIP NOFAs have made clear that HUD will not fund activities aimed solely at insurance discrimination. Instead, it funds organizations which propose enforcement-related activities which are broad-based and full-service. Broad-based means projects are not limited to a single fair housing issue, i.e., they must cover multiple issues related to housing discrimination covered under the FHA (e.g., insurance, mortgage lending, advertising, sales, and rentals). Full-service means they cannot be restricted to testing activities, but also must include complaint intake, investigation, etc.

We believe this approach is sensitive to the Committee's congressional concerns and is consistent with HUD's statutory obligation to enforce the FHAct.

USE OF FHIP FUNDS FOR HOMEOWNERS' INSURANCE-RELATED PURPOSES

Question. Despite our directive against the use of FHIP funds for insurance-related purposes, HUD apparently has failed to inform FHIP grant applicants and grantees that they are not to use the grants for activities aimed at homeowners' insurers. Moreover, in HUD's most recent announcements of FHIP awards, the agency has not provided any indication of how the funds will be used whereas such uses previously were specifically identified. Why are you not informing the public regarding the uses to which FHIP funds will be put, and how are we to know whether you are adhering to our intent that they not be used in the insurance area?

Answer. In the past, the Department published in the Federal Register an announcement identifying the organizations selected for FHIP awards each year. Although the Department did not publish the announcement of the 1998 awardees in the Federal Register, the HUD Web site did inform the public of the recipients of the 1998 grants, and provided a brief description of each project. We believe the utilizing the HUD web site is a very effective means of communicating with the general public and simultaneously informing our stakeholders. Although, the HUD web site have been publicly recognized as singularly effective, we will certainly revisit the policy of publishing the awards in the Federal Register as well. We also want to state again that we have responded to Congressional concerns regarding property insurance issues and that since 1997, FHIP NOFA, have made clear that HUD will not fund activities aimed solely at insurance discrimination. Instead, we fund organizations where enforcement-related activities are broad-based and full service. We believe this approach is sensitive to the Committee's concerns and is consistent with HUD's statutory obligation to enforce the Fair Housing Act.

[Press Release, November 24, 1998]

PRESIDENT CLINTON ANNOUNCES \$11.5 MILLION IN GRANTS TO HELP GROUPS IN 42 CITIES CRACK DOWN ON HOUSING DISCRIMINATION

(HUD News, HUD No. 98-628)

WASHINGTON—President Clinton today announced \$11.5 million in grants to groups in 42 cities to help them carry out his crackdown on all types of housing discrimination, including a new focus on reducing discrimination against recent immigrants, who are predominantly minorities.

"Members of every family in America want to be able to live in any neighborhood and in any home they can afford, free from discrimination," President Clinton said. "The Fair Housing Act gives families this legal right, and we are determined to enforce it as part of our initiative to create One America of equal opportunity."

Housing and Urban Development Secretary Andrew Cuomo said that in addition to continuing efforts to wipe out housing discrimination against minorities and others born in the United States, many of the HUD grants are targeted to groups that have not traditionally sought assistance in fighting housing discrimination, particularly new immigrants.

"The Statue of Liberty doesn't have an inscription saying 'Give me your tired, your poor, but keep them out of nice white neighborhoods,' Cuomo said. "People who flee persecution elsewhere in search of the American Dream shouldn't have to suffer discrimination in our country."

Cuomo said private, non-profit fair housing groups in the following states will get the \$11.5 million in grants from HUD to investigate allegations of housing discrimination, educate the public and housing industry about housing discrimination laws, and work to promote fair housing.

Alabama	\$294,005
Arizona	200,000
California	1,700,000
Colorado	305,158
Dist. of Columbia	93,259
Georgia	277,000
Illinois	899,966
Indiana	218,366
Kentucky	349,995
Louisiana	350,000
Massachusetts	243,430
Michigan	350,000

Minnesota	337,750
Missouri	421,282
Montana	448,626
Nevada	204,679
New Jersey	350,000
New York	616,112
North Carolina	448,557
Ohio	300,000
Oregon	182,847
Pennsylvania	810,000
Tennessee	474,493
Texas	932,883
Virginia	350,000
Washington	350,000

"Housing discrimination is illegal, intolerable and un-American" Cuomo said. "The grants we're awarding today will strengthen our partnership with local groups around the country working to put a stop to this outrageous conduct."

The Fair Housing Act bars housing discrimination on the basis of race, color, religion, sex, disability, family status and national origin. The Act covers the sale, rental, financing and advertising of almost all housing in the nation. Fair housing investigations are conducted by HUD investigators, state and city agencies working with HUD, and private fair housing groups that receive HUD funds.

Unlike past years, today most immigrants to the United States are minorities. While 85 percent of immigrants were white Europeans in 1900, only 16 percent of immigrants were Europeans in 1996.

Studies show that minority immigrants experience worse housing conditions than European immigrants. In addition, recent immigrants are less likely to be homeowners than earlier immigrants, and non-English speaking immigrants face special difficulties in understanding their fair housing rights.

Cuomo said all types of housing discrimination are much harder to detect today than they were years ago, making it more important than ever for HUD to work in partnership with local groups to root out illegal acts of discrimination.

"Today housing discrimination is subtle, not blatant," Cuomo said. "For example, landlords usually don't say openly that they don't rent to blacks or Hispanics—they just say there are no vacancies when a minority shows up. Then, miraculously, several vacancies suddenly appear when a white person walks in five minutes later."

The grants, which are funded under HUD's Fair Housing Initiatives Program, will address sophisticated and subtle forms of discrimination through paired testing as well as other investigative tools.

During testing, people of different backgrounds—based on their race, ethnicity, family status, sex, religion or disability—pose as prospective renters or homebuyers. Testers—who state they have similar incomes, assets and credit ratings—check to see if they are treated differently from one another by landlords, people selling homes, lenders making mortgage loans, or companies selling homeowners insurance.

Just last month, a Richmond, VA, fair housing group using HUD funds for testing won a record \$100 million racial discrimination judgment against Nationwide Insurance Co.

The grants announced today will also be used to investigate housing discrimination complaints, to educate members of the public about their rights, and to train housing industry groups and local governments on their responsibilities under the Fair Housing Act.

A total of \$800,000 of the grant money, which went to five groups, was set aside to expand fair housing services to people with disabilities.

Cuomo last week announced the most comprehensive and sophisticated nationwide audit ever conducted to test for and evaluate housing discrimination in urban, suburban and rural communities around the nation. The audit will include 3,000 to 5,000 tests for housing discrimination. Testers will examine and evaluate patterns and trends in housing sales, rentals, and mortgage lending to minorities.

Since 1993, HUD has received nearly 44,000 fair housing complaints and has helped obtain over \$150 million in settlements and court judgments in housing discrimination cases. This year HUD has also obtained commitments from lenders to make over \$3 billion in home mortgage loans to minorities and low-income families to settle accusations of housing discrimination.

As part of his One America Initiative, President Clinton directed Cuomo to double enforcement efforts brought against perpetrators of housing discrimination by the year 2001. HUD has already doubled its enforcement actions to a rate of 60 to 70

a month, compared with less than 30 enforcement actions per month during the Clinton Administration's first term.

Cuomo said HUD will be able to continue moving aggressively against housing discrimination as the result of an increase in the budget of its Office of Fair Housing and Equal Opportunity from \$30 million in the 1998 fiscal year to \$40 million in the current fiscal year.

People who believe they've been harmed by housing discrimination can file complaints with HUD by calling 1-800-669-9777 or on the Internet at <http://www.hud.gov/hdiscrim.html>

Fighting Housing Discrimination fiscal year 1998 Fair Housing Initiatives Program (FHIP) Awards

FIGHTING HOUSING DISCRIMINATION—FISCAL YEAR 1998 FAIR HOUSING INITIATIVES
PROGRAM (FHIP) AWARDS

(ALPHABETICAL BY STATE, AND CITY WITHIN THE STATE)

ALABAMA

The Fair Housing Agency of Alabama, based in Mobile, received \$94,718 to continue maintenance and enforcement of fair housing laws in Southern Alabama and assist residents to exercise their fair housing rights.

The Mobile Fair Housing Center received \$199,287 to provide fair housing activities in Southern Alabama. Enforcement action will be conducted in both the State's metropolitan and rural areas. The grant will enable the organization to expand its capacity to provide fair housing enforcement services that address the needs of people with disabilities.

ARIZONA

The Arizona Center for Disability Law, with offices in both Phoenix and Tucson, received \$200,000 to enforce fair housing rights for persons with disabilities in Arizona.

CALIFORNIA

California Rural Legal Assistance, based in San Francisco, received \$100,000 to develop, implement and coordinate a fair housing public education campaign in agricultural regions of the state.

The Fair Housing Council of Riverside County received \$202,357 to expand and enhance private enforcement and education outreach components of its present fair housing program and to expand services.

The Fair Housing Council of Fresno received \$100,000 for outreach and education to consumers, housing providers and government officials in the Central Valley of California. The Council will also provide individual assistance to consumers.

The Fair Housing Council of San Gabriel Valley in Pasadena received \$291,850 to help remove barriers to fair housing.

Sentinel Fair Housing of Oakland received \$349,900 to provide technical assistance, recruit and train new rental housing testers, provide for complaint intake, and undertake tests for accessibility.

Community Legal Services, based in San Jose, received \$350,000 to provide fair housing advocacy for people of various protected classes. The organization will also investigate complaints, undertake testing and do referrals.

The Fair Housing Council of Marin, in San Rafael, received \$297,485 to work with traditional civil rights groups located in Sonoma City, an area underserved by fair housing organizations.

COLORADO

Newsed Community Development Corporation of Denver received \$305,158 for testing, complaint referral, pre-application tests of non-regulated lenders and regulated lenders, and referrals of fair housing/fair lending complaints to HUD.

DISTRICT OF COLUMBIA

The Judge David L. Bazelon Center for Mental Health Law of Washington, DC received \$93,259 to conduct an 18-month campaign of testing, administrative enforcement and litigation in northern Virginia. The Mental Health Center will work with Independent Living Centers to assist people with disabilities to exercise their fair housing rights.

GEORGIA

Metropolitan Fair Housing Services received \$277,000 to address all discriminatory housing practices against Georgia's Hispanic communities.

ILLINOIS

Access Living of Metropolitan Chicago received \$350,000 for disability projects that address the fair housing enforcement needs of persons with disabilities.

The John Marshall Law School received \$349,972 to contribute to the goal of substantially increasing enforcement actions with vigorous testing and enforcement.

Latinos United of Chicago received \$100,000 to develop a comprehensive Latino suburban fair housing program.

St. Clair County received \$99,994 to target predominantly African-American inner city, low- and moderate-income people for rental, sales, and lending education and to provide outreach to the homeless for rental education.

INDIANA

Northwest Indiana Open Housing received \$218,366 to employ rental and sales tests in an effort to stamp out housing discrimination.

KENTUCKY

The Lexington Fair Housing Council received \$349,995 to continue enforcement of fair housing laws through testing, filing of complaints, complaint processing, enforcement, and analysis of impediments and related activities.

LOUISIANA

The Greater New Orleans Fair Housing Action Center received \$350,000 to counteract housing discrimination on behalf of all protected classes in all housing markets, through a variety of methods.

MASSACHUSETTS

The Housing Demonstration Project in Holyoke received \$243,430 to work with traditional civil rights groups and the Legal Assistance Corporation of Massachusetts, to work on fair housing issues and concerns.

MICHIGAN

The Fair Housing Center of Metropolitan Detroit received \$350,000 to conduct housing discrimination activities in 11 counties served by regional fair housing organizations.

MINNESOTA

Southern Minnesota Regional Legal Services received \$337,750 for a fair housing enforcement project that will extend enforcement services to reach all protected classes.

MISSOURI

Metropolitan St. Louis Equal Housing Opportunity Council received \$71,282 to increase work on discrimination complaints from immigrants and homebuyers through seminars, focus groups and public forums.

The Kansas City Fair Housing Center received \$350,000 to continue its outreach and collaboration with local consortiums and to extend partnerships with community education programs.

MONTANA

Montana Fair Housing, based in Missoula, received \$350,000 to conduct education and outreach and perform testing and other investigative activities that can lead to the filing of fair housing complaints, particularly from Native Americans.

Billings Community Housing Resource Board received \$98,626 to provide people with disabilities, Native Americans, women and the housing industry with information on fair housing laws and rights.

NEVADA

The Nevada Fair Housing Center in Las Vegas received \$204,679 to conduct private enforcement activities including complaint intake, referral, testing, and conciliation of fair housing claims.

NEW JERSEY

The Fair Housing Council of Northern New Jersey received \$350,000 to conduct fair housing testing in Northern New Jersey.

NEW YORK

Asian Americans for Equality, based in New York City, received \$213,626 for fair housing efforts targeted to the growing Asian American community in New York City.

The Open Housing Center in New York City received \$350,000 for testing, to investigate complaints of discrimination, and for education efforts.

Greater Upstate Law Project of Rochester received \$52,486 to develop a statewide Electronic Center for fair housing; service areas in semi-rural New York with its web site and to train social workers in fair housing complaint intake and processing.

NORTH CAROLINA

The Winston-Salem Human Relations Commission received \$100,000 to provide education and outreach to African Americans, Hispanics, elderly and disabled, and households with children that have unmet fair housing needs.

The North Carolina Fair Housing Center received \$348,557 to investigate all areas of housing discrimination, refer complaints to appropriate enforcement agencies including HUD and to investigate and test the nature and level of predatory lending and racial steering.

OHIO

The Fair Housing Center of Toledo received \$300,000 to enhance its fair housing programs, combat illegal housing practices and to affirmatively further fair housing. The grant to the Fair Housing Center of Toledo will also enable it to enter into partnership with private enforcement organizations, local government agencies or traditional civil rights organizations and focus on systemic investigations of housing discrimination.

OREGON

The Oregon Advocacy Center received \$182,847 to build on existing services of community training, information, referral of fair housing complaints and legal representation for victims of housing discrimination. The Center will work with the Fair Housing Council of Oregon to build upon its existing enforcement services.

PENNSYLVANIA

The Tenant's Action Group (TAG) in Philadelphia received \$350,000 to expand regional fair housing activities performed by TAG under four previous FHIP grants, which also included a Delaware Valley Fair Housing Partnership. This regional partnership consists of five agencies that collectively enforced federal, state and local fair housing laws in the city of Philadelphia and its suburban counties in Delaware and southern New Jersey.

The Public Interest Law Center of Philadelphia received \$300,000 for fair housing enforcement actions and to conduct investigations of systemic housing discrimination.

The Reading-Berks Human Relations Council of Reading received \$160,000 to provide community-based fair housing intake, investigations, mediation, conciliation, testing and education services.

TENNESSEE

The Tennessee Fair Housing Council, based in Nashville, received \$349,875 to continue its efforts of enforcement through testing, filing of fair housing complaints, complaint processing and the gathering and dissemination of fair housing information and data.

Memphis Area Legal Services received \$124,618 to implement a program to identify and take action to remove architectural barriers to fair housing for individuals with disabilities.

TEXAS

A Fair Housing Center in Houston will be started by the National Fair Housing Alliance, which received \$399,989 for the project. Houston is regarded as an underserved area—one that currently is not served by a private or public fair housing enforcement organization. Activities being funded under the grant will address the fair housing needs of new immigrant groups and those of other underserved populations.

Hidalgo County received \$88,895 to promote equal opportunities and to eliminate fair housing barriers through a newly created fair housing center for Hidalgo County.

The San Antonio Fair Housing Council received \$350,000 to sustain its relatively new organization. Funds will also be used to recruit and train testers, conduct 282 tests, investigate fair housing complaints and to undertake litigation.

The Austin Tenant's Council received \$93,999 to address a high denial rate for minority home mortgage applicants and to address the lack of accessible housing in Austin, Texas.

VIRGINIA

Housing Opportunities Made Equal of Richmond received \$350,000 to undertake an enforcement project which covers two thirds of the Commonwealth of Virginia. Fair Housing protections will be provided for African-Americans, Hispanics and other protected classes under the Fair Housing Act.

WASHINGTON

The Northwest Fair Housing Alliance (NWFHA) received \$350,000 to continue its enforcement activities in Spokane and to extend its services to immigrants and American Indian citizens.

USE OF FHIP FUNDING

Question. For the hearing record, could you please provide a detailed accounting for the agency's expenditures in the past three years on any and all activities relating to alleged discrimination by homeowners' insurers?

Answer. HUD does not fund projects which focus solely on property insurance discrimination or any other single practice prohibited by the Fair Housing Act. The broad-based projects which have been funded over the past three years may include property insurance matters among the issues they review. Although we are unable to identify the specific dollars each project has spent on such activities (and sometimes such activity may be as minimal as responding to a telephone call from the public seeking information about their rights), we can provide you with FHIP dollars assigned to the enforcement-related initiatives for the past 3 years. We estimate that less than 1 percent of the funds below have supported insurance-related activity in fiscal years 1997 and 1998.

[In millions of dollars]

Private Enforcement Initiative Funds, by fiscal year:	
1999	9.3
1998	9.3
1997	10.5
Fair Housing Organizations Initiative, by fiscal year:	
1999	1.2
1998	1.6
1997	4.05

USE OF FHIP FUNDING

Question. For the hearing record, could you please identify the uses to which FHIP grants funded with fiscal year 1998 appropriations were put?

Answer. For fiscal year 1998, HUD awarded a total of \$15 million to grantees under the FHIP. Of this total, \$3.5 million went for the National Education and Outreach Program. The objectives of this program are to: (1) provide fair housing information to the public and (2) develop and implement methods for preventing and responding to the community tensions arising from persons exercising their fair housing rights.

The other \$11.5 million of the \$15 million total went for the regional, local, and community based programs. HUD allocated this \$11.5 million as follows:

- (1) \$9.3 million for the Private Enforcement Initiative:
 - \$7.8 million is the "General Component," used for 24-month projects. Each project has a \$350,000 cap.
 - \$1.5 million went for the "Joint Enforcement Project Component," used to promote partnerships between private fair housing enforcement organizations, FHAP agencies and/or traditional civil rights organizations to focus on systemic investigations of discrimination. The projects are for 18 month projects, with caps of \$300,000 per project.
- (2) \$1.2 million to the Fair Housing Organizations Initiative:
 - \$800,000 went for the "Continued Development Component," which enhances the ability of organizations to help persons with disabilities pursue their rights under the FHAct.
 - \$400,000 went for the "Establishing New Organizations Initiative," which funds the creation of a new fair housing enforcement organization in an underserved area. This is a 24–36 month project.
- (3) \$1 million for the "Education and Outreach Initiative" which supports regional, local and community-based education and outreach efforts. The projects run for 18 months. The award cap is \$100,000.

QUESTIONS SUBMITTED BY SENATOR BURNS

INDIAN HOUSING BLOCK GRANT PROGRAM

Question. The population on Indian reservations has been growing lately and will continue to grow in the future, especially now with the implementation of the "Welfare to Work" program. This increase in population will, in turn, exacerbate the housing problems on our reservations and the demand for housing will grow. The funding for Indian housing programs has been flatlined for fiscal year 2000. Why isn't there an increase in funding for Indian Housing in fiscal year 2000? What are your plans to combat the impact of this population influx?

Answer. The President's fiscal year 2000 Budget request continues to support budget increases that were provided in fiscal year 1999 for the Indian Housing Block Grant (IHBG) program, the Section 184 Indian Housing Loan Guarantee Fund and the Indian Community Development Block Grant program. Other programs proposed for fiscal year 2000 from which Indian Tribes and their Tribally Designated Housing Entities are expected to benefit include the Welfare-to-Work (WTW) Section 8 Voucher Program (25,000 units), and Service Coordinators for the Elderly, proposed to be funded at \$50 million.

As the implementation of IHBG progresses, the Department must ensure that tribal management and operational capability exists. Some larger tribes now receive significantly more funding post-NAHASDA than they received under pre-NAHASDA programs. The Department is confident that the funding proposed in the President's fiscal year 2000 budget request is the optimum amount that can be prudently managed in Indian Country while maintaining the integrity of both the (1) programs and (2) Federal funds.

To date, there is no evidence of any large influx of Indians returning to their home reservations due to Welfare-to-Work initiatives. Should such a trend develop, however, it is expected that Indian tribes and TDHEs would compete favorably with PHAs for the WTW housing assistance funds.

RURAL HOUSING

Question. How much of HUD's annual budget is dedicated to rural housing? What is HUD's record in serving isolated rural communities? Of HUD's overall \$2.5B increase proposed in the President's budget, what percentage of this increase will be going to rural America? I would like to see statistics and dollar amounts regarding urban versus rural housing.

Answer. Introduction. Historically, as the Department of Housing and Urban Development, urban affairs have been our primary focus for most of the agency's existence. While the U.S. Department of Agriculture (USDA) continues to have the lead through the Rural Development Agency, HUD's involvement in rural affairs has increased in recent years. For purposes of this response, the term "rural" has been interpreted to mean an area outside of a Metropolitan area OR an area outside urbanized areas within a Metropolitan area. This response does not include Native American Housing programs with the exception of Rural Housing. Research showed that our rural customers consist of:

- 26.1 million households occupy units in rural areas;¹
- 37.3 million households occupy units outside areas that are not a part of central cities (AHS);
- non-entitlement recipients of CDBG, HOME and Emergency Shelter Grants;
- owners and managers of approximately 1,460 FHA-insured multifamily projects in non-metro areas;²
- over 100 State local and regional PHAs that operate public housing (17 percent of the approximately 1.3 million units) and administer (with State Housing Finance Agencies) certificates and vouchers (19 percent of the approximately 1.35 million units).³

I. COMMUNITY AND PLANNING DEVELOPMENT

The most specific instrument for distribution of funding to rural areas within CPD programs is through the Rural Housing and Economic Development program. In addition, assistance is provided to rural areas through many other of CPD's programs, as discussed below.

The fiscal year 2000 budget proposes \$20 million for the Rural Housing Economic Development program to encourage new and innovative approaches to addressing

¹ American Housing Survey, 1995, hereafter referred to as AHS.

² Assessment of the HUD-Insured Multifamily Housing Stock Final Report, 1993.

³ Characteristics of HUD-Assisted Renters and Their Units in 1989, March 1992.

the housing and economic development needs of the Nation's rural populations. There is a great need to expand the supply of affordable housing in our rural communities. In addition, because of out-migration and disinvestment, many rural areas suffer from severe economic distress, with few employers and limited commercial activity. Rural areas must be able to attract and retain firms in economic growth sectors—innovative manufacturers, for example—to revitalize commercial streets where demand clearly exists but infrastructure has aged and capacity building is needed, and to carry out flexible micro-lending that supports promising enterprises. HUD has significant experience in the funding and development of housing and community economic development programs in rural areas through the CDBG and HOME programs and others. The Department has special expertise in delivering technical assistance and building institutional capacity. The new Office of Rural Housing and Economic Development at HUD will effectively integrate the impact of HUD's formula grant programs with highly targeted new funding for innovative projects. HUD will continue to work closely with USDA, the Department of Interior, the Appalachian Regional Commission, other Federal agencies, and leading rural development groups to design more effective responses to the housing and economic development needs of our Nation's rural communities.

This will include examining our own programs to see if legislative and/or regulatory changes may be necessary to make them more responsive to rural needs. In addition, HUD plans to devote a number of our new Community Builder "specialists" to providing coordination and cross-state solutions to the problems facing rural areas including people living in Colonias, Native Americans, migrant farm workers and others.

While the population is growing in some rural areas, especially those focused on retirement or recreation, and particularly due to the foreign immigration and movement of urban/suburban residents away from central cities, the population continues to decline in most rural areas. This is in part due to the lack of industry relocations to these areas and the resulting lack of jobs. While some rural areas are benefiting from the strong economy nationwide, many are experiencing extremely high unemployment rates. Rural areas need to be able to increase the community and economic development funds that flow their way, to learn how to attract manufacturing, and to improve the capacity of nonprofit and other partners in determining the overall well-being of the area.

HUD has significant and historic experience in managing housing, community and economic development programs in rural areas, and continues to demonstrate this experience with and commitment to rural communities through several of its housing, community and economic development programs such as the Community Development Block Grant and HOME Investment Partnerships programs. This experience and the established partnerships that HUD has with organizations such as the Housing Assistance Council provide the basis for creating innovative approaches to the particular problems of people and families in the Nation's rural areas. Moreover, this new program will allow for the effective integration of HUD's formula and other existing community and economic development programs with the highly specific and targeted new funding. This integration of existing and new efforts will provide a strong synergy which will leverage the results of both the existing programs as well as the new program.

Homeless Programs / Continuum of Care

Between 10 and 15 percent of Homeless Assistance program funding goes to rural areas annually. In the 1998 competition, 383 of 2,644 projects (14 percent) were by applicants from rural areas. Of the \$724 million awarded in the 1998 competition, \$83 million (11 percent) were awarded to projects serving rural areas. Projects in rural areas fared well in the competition. Nationally, 56 percent of all projects were awarded funding; 56 percent of all projects serving rural areas were awarded funding. Nationally, 57 percent of total dollars requested were awarded; 51 percent of dollars requested for rural projects were awarded.

HOPWA

HOPWA funds are awarded to States and local governments for projects in jurisdictions which do not qualify for a formula allocation.

Approximately 10 to 15 percent of funds go to non-metropolitan areas. Data from the Center for Disease Control shows that 5.6 percent of cumulative AIDS cases are in rural counties. Of the 97 formula grants, 34 are for areas outside of qualifying metropolitan areas and states in aggregate received \$30.862 million out of \$200.475 million allocated in fiscal year 1999 by formula (15.4 percent). Thus, the \$15 million increase is expected to provide about \$2.3 million to \$3 million for expanding HOPWA efforts in non-metropolitan areas.

For example, in 1998, a HOPWA Special Project of National Significance Award for \$1,118,150 was given to the AIDS Task Force of Alabama, Inc., to operate the Alabama Rural AIDS Project. For very detailed information, we recommend going to our web page, www.hud.gov/cpd/hopwahon.html, where all HOPWA program descriptions (over 300 pages) can be found, including all of the State-wide programs that will involve activities in rural areas.

Community Development Block Grants

CDBG formula funds are split 70–30, with approximately 30 percent going to State and small city funding. Therefore, \$38.79 million of the increase requested under CDBG will go to State and small city funding.

Based on historical data, about 52 percent of State CDBG money is awarded to municipalities with populations of 10,000 or less; about 14 percent to municipalities of over 10,000 and about 33 percent to counties. The 10,000 population cutoff used for CDBG reporting approximates the population ceiling for several USDA programs.

States spend about 50 to 55 percent of their money on public facilities with half of this going for water and sewer projects; about 22 to 26 percent for housing (over $\frac{2}{3}$ of that for housing rehabilitation); about 16 to 22 percent is used for economic development and about 4 percent goes for planning and administration. In addition, the State CDBG program includes a requirement that the border States of Texas, New Mexico, Arizona and California use up to 10 percent of the State CDBG funds for Colonias. The Colonias and Migrant Task Force was created in 1995 to better coordinate HUD's efforts to serve the Colonias and farmworkers. Key accomplishments of this inter-agency working group include: a \$1.3 million contract to provide technical assistance toward development of 500 units of housing in South Texas area and another 500 units in various farm worker locations in California; a 1996 internship program for young colonias residents interested in learning about the workings of government (10 positions). From 1991 to 1994, HUD provided nearly \$40 million in CDBG funds specifically for colonias matters. These funds went to Texas, New Mexico, Arizona and California. The four States budgeted a total of \$12,683,380 (fiscal year 1995), \$13,516,850 (fiscal year 1996), \$13,471,000 (fiscal year 1997) and \$11,815,300 (fiscal year 1998).

Regional Connections

The fiscal year 2000 budget proposed \$50 million for a Regional Connections program to expand capacity and provide incentives for "smart growth." Concern about growth, disinvestment, and decline has moved far beyond the central cities' borders. Even rural areas, the home of small town America, are exhibiting new concern about development patterns. Farmland across the country is being sold and subdivided into high-cost residential communities. In fact, since 1960, outward growth has led to an average loss of 1.5 million acres of farmland a year. As this outward expansion reaches rural areas, taxes are often driven up from rising real estate values and increased costs of services.

The good news is that across the country, regional leaders are joining together to forge strategies to address the concerns discussed above. They are attempting to design and implement regional approaches to regional problems and opportunities.

Community Empowerment Fund

HUD's fiscal year 2000 proposal would fund the Community Empowerment Fund (CEF) at \$125 million, to substantially increase capital for business investment and job creation in underserved inner city and rural areas. By combining \$125 million in Economic Development Initiative (EDI) grants with an estimated \$625 million in Section 108 guaranteed private loans, the CEF will provide a total of \$750 million in grants and low-cost loans in these communities. The program is thus expected to leverage up to five times the guaranteed loan amount in additional private sector financing, and this will create an estimated 100,000 jobs through direct business development and other spill-over effects.

Job creation projects funded through the CEF will include: loans for business expansion and modernization; start-up costs for new and small medium-sized businesses; preservation and expansion of existing industrial facilities; and retail and commercial revitalization initiatives, such as grocery stores and neighborhood shopping centers.

America's Private Investment Companies (APIC)

The CEF will be complemented by a second major vehicle for expanding investment capital for distressed areas, both urban and rural. The Administration is proposing a major equity incentive program to fill that gap. For fiscal year 2000, HUD has requested \$37 million in credit subsidy budget authority for \$1 billion in pri-

vately issued investment capital loans that the Federal Government will guarantee to go with \$500 million in private equity commitments for new investment partnerships-for-profit venture capital funds known as America's Private Investment Companies (APICs). APICs will, in turn, make equity investments in larger businesses that are expanding or relocating in inner cities and rural areas. The \$37 million in Federal credit subsidy would thus leverage an estimated \$1.5 billion in private funds, creating an estimated 200,000 jobs in distressed areas. Private investors' funds would be at risk ahead of Government funds, but the individual investment decisions would be approved by Government for consistency with the public policy purpose of the program. The APIC program will be jointly administered by HUD and the Small Business Administration (SBA). Its financing structure will be modeled after the current Small Business Investment Company (SBIC) program. Five potential organizations will be selected, each with a minimum of \$100 million in private equity capital and each eligible for twice that much in additional Federal loan guarantees. The Government leverage will be provided by using debenture securities similar to the SBIC debentures and funded through the same process. Key targets will be leveraged buyouts, corporate divestitures, roll-ups, and focused market expansion that could be relocated to serve low- and moderate-income communities with the appropriate financial tools.

HOME Investment Partnerships Program

The HOME Investment Partnerships Program (HOME) provides assistance to State and local governments to address housing needs of low-income and very low-income persons. Forty percent of HOME funds are allocated by formula to States. Although States may spend these funds anywhere in the state, much of their money goes to rural areas.

HOME, HUD's successful housing rehabilitation and production program, is a key tool for increasing the availability of decent, safe and affordable housing in both urban and rural America. HUD has found that HOME exceeds the program's own affordability targets as well as the targets for funding local nonprofit housing organizations and creating mixed-income housing opportunities. The program works through local governments to finance the construction and rehabilitation of multi-family rental housing, improve substandard housing for current owners, and assist new home buyers through acquisition, construction and rehabilitation. HOME also provides rental-based assistance to families. Beyond its impact in bricks and mortar terms, HOME has been an important tool for enhancing the capacity and experience of the nation's affordable housing producers. In fiscal year 2000, the HOME program is requested at \$1.610 billion, an increase of \$10 million over the 1999 enacted level. This program level will provide 85,400 additional units of decent, safe and affordable housing for both owners and renters through the combination of new construction (34 percent), rehabilitation (48 percent) and acquisition (15 percent). About 3 percent will be used for tenant based-assistance.

II. FAIR HOUSING AND EQUAL OPPORTUNITY

Fair Housing activities are available in both urban and rural areas. Increased funding is in part targeted as expending services to both unserved and underserved localities. The Fair Housing Initiatives Program (FHIP) will increase by \$3.5 million in 2000 to a level of \$27 million. Funds are for three major components. First, "private enforcement" efforts include testing and other investigative activities such as audits of new construction to determine compliance with accessibility requirements, and testing in real estate market transactions. Second is "education and outreach" focusing on national campaigns to educate protected classes and to educate the housing industry about the Fair Housing Act. The 2000 FHIP budget also includes \$7.5 million for the second year funding of a national audit of discrimination in housing rental and sales. This audit will create the first ever report card at both the national and local levels of the extent of discrimination against the Nation's major racial and ethnic groups. The national audit will include urban, suburban and rural areas.

The budget proposed a joint partnership between FHIP and Fair Housing Assistance Program (FHAP). This FHIP/FHAP partnership initiative is proposed to focus on new and underserved populations by ensuring the full protection of the Fair Housing Act and other civil rights laws for persons who face language, cultural, and other barriers that currently limit the utility of these laws to address persistent housing discrimination. This request includes a \$3.5 million set-aside that will be added to the FHIP to support a fair housing partnership between the private and public fair housing sectors. This fair housing partnership effort will be funded equally by the Fair Housing Assistance Program (FHAP) through an equal \$3.5 million

contributions, for a combined \$7 million set-aside. The Budget will also support other fair housing enforcement and education activities.

An additional \$2 million will be used to fund the establishment of new fair housing organizations. It is envisioned that the focus of the funding for fiscal year 2000 will be on underserved groups. One group that has been in dire need of more fair housing activity is the residents of non-metropolitan areas, especially rural areas. Another group that has been underserved by existing fair housing organizations is non-English speaking minorities. It is envisioned that the outreach initiative funding could enable the creation of fair housing organizations to assist such populations.

The Private Enforcement Initiative, as a major component of FHIP, has a total proposed level of funding of \$7.75 million in fiscal year 2000. Under this component, \$6 million is for the following multiyear projects: (a) carry out testing and other investigative activities, such as regional audits of new construction to determine compliance with accessibility requirements; (b) discover and remedy discrimination in public and private real estate markets and real estate-related transactions through assisting victims to identify practices that denied them equal housing opportunity, and; (c) respond to individual complaints of discrimination from home seekers.

FHAP agencies and private groups will jointly engage in strategic planning to focus their fair housing enforcement activities. They will be required to coordinate their activities with HUD to ensure no duplication exists and that the results of their partnerships make a maximum contribution to the doubling of enforcement effort.

The fiscal year 2000 Budget request for FHAP is \$20 million. This is an increase of \$3.5 million over the fiscal year 1999 appropriation which will be used to fund an innovative Fair Housing Partnership between State and local government fair housing enforcement agencies and private fair housing groups. The Department is proposing this Partnership focus on underserved populations to ensure that persons who face language, cultural, and other barriers have the full protection of the Fair Housing Act. The focus is expected to include racial and ethnic minorities, rural populations, persons with disabilities, and homeless persons. The Department will carry out this initiative through the existing FHAP and FHIP programs.

This Partnership initiative will be funded equally by the FHAP and FHIP through a combined \$7 million set-aside. Through its support of joint efforts by governmental and private entities, the partnership initiative will foster substantial and new fair housing results that individual organizations could not achieve alone.

The balance of the \$20 million requested for fiscal year 2000 will support the activities of approximately 90 substantially equivalent fair housing enforcement agencies, an increase of 5 over the 1999 level. These agencies will process housing discrimination complaints based on race, color, religion, sex, familial status, disability, and national origin.

The total funding requested for both FHAP and FHIP programs in fiscal year 2000 is \$47 million. Together, these two programs form a national comprehensive fair housing strategy against housing discrimination based upon greater cooperation between the public and the private sectors.

III. HOUSING

The Section 203(b) program, enacted in the National Housing Act of 1934, provides mortgage insurance for one- to four-family residences. This program has contributed to expanding the opportunities for both urban and rural homeownership in the United States and will continue to meet the needs of first-time homebuyers, working families, and minority families, as well as underserved communities, especially central city and rural areas. Under the 203(b) program, any person able to meet the cash investment, mortgage payments and credit requirements may obtain an FHA-insured loan from a private lending institution to purchase a home. Since its inception through September 30, 1998, the MMI Fund has insured approximately \$988 billion in mortgages for about 22.5 million families. There are no statistics on the break-out between urban and rural areas.

IV. PUBLIC AND INDIAN HOUSING

Small (sometimes rural) PHAs receive approximately 12 percent, which translates into \$23.5 million of the Public Housing Operating Fund annual appropriation.

Participation in the Section 8 certificate and voucher program by rural residents or persons living in non-metro areas has not been examined in recent years. It is not known how much of the overall outlay of Section 8 housing funds have gone to rural or non-metro areas. What is known though, is that a sizeable proportion of the rural/non-metro Section 7 certificate and voucher area administered by a small

proportion of PHAs. A study undertaken by the Housing Assistance Council in 1989 estimated that approximately 283,000 rural households have been in some way involved in the Section 8 program, and that the state and regional PHAs that serve rural areas administer at least 40 percent of certificate and vouchers in rural/non-metro areas.

V. POLICY DEVELOPMENT & RESEARCH

The 2000 research plan will build on the 1999 agenda. It will focus PD&R's efforts on current policy topics of significance to the Nation while continuing the housing market surveys and other core activities. One proposed activity 2000 will be studies of effective and ineffective approaches to regional problem-solving that partner cities, suburbs, and rural areas.

In addition to the above information, the Housing Assistance Council has produced the following studies with HUD assistance which might be of interest:

- Welfare Reform and Rural Housing Case Studies
- Elderly Housing in Rural Areas
- State of Rural Housing (annual report 97 and 98)
- Rural Housing and Economic Development in Boomtowns
- Migrant Farmworker Housing
- HOME Program Use in Rural Areas
- State Plan's Coverage of Rural Housing
- HOME, CDBG, and Farmworker Housing Development
- Analysis of Fair Housing Discrimination Cases in Rural Areas
- A Report on Lending Data for Rural Parts of Metro Areas
- Mobility and Economic Self Sufficiency of Section 8 Participants in Rural Areas
- Non Profit/For Profit Joint Ventures in Rural Affordable Housing: Case Studies
- Updated Guide to Housing Organizations for Rural Areas
- A Study of Fair Market Rates in Rural Areas stop

LEAD-BASED PAINT GRANTS

Question. In fiscal year 1999, the Missoula Housing Authority applied for a lead-based paint grant for low-income housing and was told that HUD would be awarding grants in November. HUD did not award grants until March. The indecision and lack of communication is frustrating to local organizations. HUD needs to honor its commitments so that local organizations can honor their commitments to local communities. What can be done about this situation? How does HUD intend to honor their commitments?

Answer. We regret any misunderstandings between HUD and the Missoula Housing Authority and that they experienced frustration as a result. HUD attempts to estimate when grant announcements will be made based upon workload and historical experience, but projected grant announcement dates are only estimates and are described as such. In the future, we will make certain that recipients fully understand that announcement dates provided in advance are tentative dates.

RURAL HOUSING

Question. HUD now has a new office and \$25 million for rural housing and economic development. What is the status of this office and when does HUD expect to make grant funds available to rural development?

Answer. The Office of Rural Housing and Economic Development is located in the Office of Community Planning and Development under the Deputy Assistant Secretary for Economic Development. A Rural Housing and Economic Development Coordinator will be selected shortly. A listing of the awards made pursuant to the March 8, 1999, Notice of Funding Availability is attached.

FISCAL YEAR 1999 RURAL HOUSING AND ECONOMIC DEVELOPMENT GRANT WINNERS

Name of organization	Applicant City-State	Grant amount
Capacity Building:		
Upper Sand Mountain Un. Meth. Larger Parish Inc	Sylvania, AL	\$47,300
Housing America Corporation	Somerton, AZ	75,000
Bishop Indian Tribal Council	Bishop, CA	88,201
Coachella Valley Housing Coalition	Indio, Ca	200,000
Yurok Tribe	Eureka, CA	200,000
Kentucky Mountain Hsg Dev Corp, Inc	Manchester, KY	200,000

FISCAL YEAR 1999 RURAL HOUSING AND ECONOMIC DEVELOPMENT GRANT WINNERS—Continued

Name of organization	Applicant City-State	Grant amount
Three Rivers Community Action, Inc	Zumbrota, MN	150,000
Fort Belknap College	Harlem, MT	200,000
Fort Peck Assiniboine & Sioux Tribes	Poplar, MT	148,633
Rocky Mountain Development Council	Helena, MT	109,369
Native Council on Economic and CDC	Walthill, ME	150,000
WREN—Women's Rural Entrepreneurial Network	Bethlehem, NH	150,000
Citizens For Affordable Homes, Inc	Carson City, NV	69,075
Adirondack Economic Development Corporation	Saranac Lake, NY	150,000
Bishop Sheen Ecumenical Housing Foundation, Inc	Rochester, NY	150,000
Sullivan County Partnership for Economic Development ..	Monticello, NY	150,000
Portage Area Development Corporation	Ravenna, OH	137,860
Kiowa Tribe of Oklahoma	Anadarko, OK	143,660
Otoe-Missouria Tribe	Red Rock, OK	97,805
CASA of Oregon	Newberg, OR	200,000
Technical College of the Low Country Foundation, Inc	Beaufort, SC	193,000
Oti Kaga, Inc	Eagle Butte, SD	188,796
Virginia Eastern Shore Economic Empowerment & Hsgn Corp.	Nassawadox, VA	115,000
Swinomish Indian Tribal Community	La Conner, WA	150,000
Catholic Charities Bureau, Inc	Superior, WI	200,000
Mountain Partners in Community Development	Elkins, WV	151,701
Innovative:		
Alaska Native Village of Tanacross	Tanacross, AK	600,000
Metlakatla Indian Community	Metlakatla, AK	500,000
Community Resource Group, Inc	Fayetteville, AR	467,500
Comite de Bien Estar	San Luis, AZ	600,000
Coachella Valley Housing Coalition	Indio, CA	600,000
Community Housing Improvement Program, Incorporated.	Chico, CA	451,397
Coyote Valley Band of Pomo Indians	Redwood Valley, CA	32,345
I-5 Social Services Corporation	Mendota, CA	509,500
Peoples' Self-Help Housing Corporation	San Luis Obispo, CA	500,000
South County Housing Corporation	Gilroy, CA	500,000
Everglades Community Association, Inc	Miami, FL	500,000
Iowa Finance Authority	Des Moines, IA	600,000
MidAmerica Housing Partnership Inc	Cedar Rapids, IA	500,000
Lincoln Hills Development Corporation	Tell City, IN	160,000
Federation of Appalachian Housing Enterprises	Berea, KY	482,374
Kentucky Highlands Investments Corporation	London, KY	461,854
Garrett County, Maryland, Community Action Committee, Inc.	Oaklands, MD	504,000
Five C, Inc	Scottville, MI	500,000
Bi-County Community Action Programs, Inc	Bemidji, MN	500,000
Blackfeet Tribe	Browning, MT	600,000
The Heriatge Institute	Poplar, MT	501,219
Housing & Economic Rural Opportunities, Inc	Las Cruces, NM	165,445
New Mexico Mortgage Finance Authority	Albuquerque, NM	600,000
Pojoaque Housing Corporation	NM	500,000
Partnership for Economic Development	Monticello, NY	500,000

Institute for Washington's Future	Renton, WA	199,500
Okanogan County Community Action Council	Okanogan, WA	196,665
The Jamestown S'Klallam Tribe	Sequim, WA	117,702

SECTION 8 HOUSING

Question. I hear from Montana that the private sector is pulling out of the Section 8 housing. Our elderly and handicapped need to feel secure where they live. What will be done to keep housing inventory stable and reassure the most needy that they will not have to move every year?

Answer. The Department shares your concern over the possible loss of quality assisted housing stock. Therefore, the Department took the initiative of issuing an emergency renewal policy in June 1999, which is designed to target increases in rental subsidy assistance to those developments most in risk of opting-out. This effort maximizes the use of existing statutory authority and available resources to maintain our inventory of valuable multifamily housing stock. Also, the Department is pursuing a cooperative effort with Congress to enact a more comprehensive solution to the loss of HUD-subsidized multifamily housing. Finally, since some owners will chose to opt-out, despite improved policies to encourage renewal, the Department is seeking authority to offer "enhanced" vouchers to all residents in projects that opt-out. This will avoid the potential for displacement of currently assisted residents when owners raise rents to local market levels.

WELFARE TO WORK

Question. Is HUD thinking about dedicating funding to those folks who are trying to break the welfare cycle? What are HUD's housing strategies for "Welfare to

Work” and helping men and women get into housing closer and to educational and job opportunities?

Answer. HUD has dedicated funding for two significant welfare-to-work initiatives in the fiscal year 2000 budget, Welfare-to-Work Rental Vouchers and the Welfare-to-Work Targeted Job Creation Initiative, a component of the Community Empowerment Fund. Also, our public housing reform is creating incentives in our existing housing programs to encourage residents to make the transition from welfare to work.

Welfare-to-Work Rental Vouchers

In fiscal year 1999, Congress appropriated \$283 million for 50,000 new incremental welfare-to-work rental vouchers. Our fiscal year 2000 budget proposes \$144 million for 25,000 additional welfare-to-work rental vouchers.

These new vouchers are targeted to families who are currently receiving, are eligible for, or have left welfare within the last 2 years and for whom the housing assistance is essential to obtaining or retaining employment. They will help families overcome a number of challenges to self-sufficiency. These vouchers will provide a safe and stable housing situation as a platform from which to find and keep a job. They will reduce the rent burden for families paying too high a percentage of their income for housing. The vouchers will also help families overcome the spatial mismatch that separates them from educational and job opportunities. Families will be able to move closer to those opportunities, or near transportation centers so they can easily get to those opportunities.

The welfare-to-work vouchers are being made available to communities on a competitive basis that requires Housing Authorities to develop their plans together with welfare and workforce development agencies. This will make sure the housing assistance is combined with the child care and other services families need for a successful transition from welfare to work. It will also ensure that the vouchers are provided to the families for whom they will be most critical to a successful transition.

The Welfare-to-Work Targeted Job Creation Initiative, funded with up to \$75 million in direct Economic Development Initiative grants and an estimated \$375 million in Section 108 guaranteed private loans, as part of the Community Empowerment Fund, is designed to help close the “jobs gap” facing many communities. HUD’s 1998 State of the Cities report indicated that despite significant recent increases in job growth in many cities, there is still a sizable mismatch between the number of low-skilled jobs available and the number of low-skilled urban residents who need work or who will need work over the next few years as Temporary Assistance for Needy Families (TANF) time limits take effect. This initiative is designed to help close this gap, with special emphasis on welfare recipients entering the workforce.

This targeted job creation initiative will support the expansion of businesses that emphasize hiring of those in transition from welfare to work—projects like the state-of-the-art Learning and Work Complex opened by the Cessna company in a long-vacant industrial facility in Wichita, Kansas. Funded with a HUD grant and a HUD-guaranteed loan, the complex is helping TANF recipients prepare for well-paying manufacturing jobs. Of the 237 graduates so far, 200 have moved into Cessna jobs that start at more than \$10/hour, and 26 are employed at other companies. Like the Cessna project, communities competing successfully under this targeted job creation initiative will combine the HUD incentives for business development with local public and private supports—like job training, child care, and—as needed. The initiative will ensure that those facing the transition from welfare to work get jobs that pay and that employers get the workers they need to be competitive. The overall \$125 million Community Empowerment Fund is projected to support an estimated 100,000 in distressed community with welfare related populations.

The Quality Housing and Work Responsibility Act (QHWRA) of 1998 is reforming public housing. Much of the reform has to do with creating greater financial and other incentives for public housing residents to move from welfare to work. Some of the specific reforms are:

- Expanding mandatory earnings disregards to a larger pool of people. This includes residents who are receiving or have received TANF assistance in the past 6 months and residents who have been unemployed for over a year. Residents usually pay 30 percent of their income for rent, so as their earnings from work increase, they pay 30 percent of that increased income as additional rent. These new rules disregard 100 percent of the increased income from rental calculations for the first year, and 50 percent for a second year.
- Permitting flat rents and ceiling rents so that rent will not increase with increased earnings.

- Mandatory hardship exemptions from minimum rent payments for families who lose welfare benefits because of time limits.
- No rent reductions for families who lose welfare benefits for failure to comply with TANF work requirements. Previous law lowered the rent in such cases. This was at odds with the purpose of welfare sanctions.
- Exemptions from community work requirements for TANF recipients who are in compliance with their TANF program.
- The continuation of the Family Self-Sufficiency (FSS) Program. This program provides both case management for supportive services and escrow accounts for additional rent due to participants' increased work earnings. Rather than going to rent, these earnings are deposited into savings accounts. The residents can access the money when they complete the program and move to unsubsidized housing.

QUESTIONS SUBMITTED BY SENATOR CRAIG

HUD ACCESSIBILITY GUIDELINES

Question. In April of 1998, your Department finalized and published guidelines pertaining to accessibility standards for the disabled. Before 1998, regulations issued by HUD contained disclaimers that there was "no guarantee of the accuracy or completeness of the information." Builders, owners, and other involved parties in Idaho are now having complaints filed against them for units built before the finalized rules were published. How is it that you can hold people liable for following guidelines when HUD did not provide any definite requirements?

Answer. Congress and the Department have provided definitive statements of the accessibility requirements of the Fair Housing Act since the Fair Housing Amendment Act of 1988 was passed. The Department has continued dialogue in the industry and has continued to expand our efforts to communicate these legislated accessibility requirements.

The first guidance provided to the public and the building industry regarding the Act's design and construction requirements was contained in the Fair Housing Amendments Act of 1988 itself. In the Act, Congress defined the coverage of the requirements, in Sections 804 (f)(3)(C) and (f)(7) of the Act, and explicitly stated the required design features for units covered under the Act. First, the Act required that:

- 1. the public and common use portions of covered dwellings be accessible to the disabled;
- 2. all doors be sufficiently wide to permit passage by a person in a wheelchair; and
- 3. all premises within the dwelling have an accessible route into and through the dwelling unit; light switches, electrical outlets, thermostats and other environmental controls in accessible locations; reinforcements in bathrooms for later installation of grab bars; and usable kitchens and bathrooms.

The Act also stated that compliance with the American National Standard accessible buildings and facilities (ANSI A117.1) satisfied the accessibility requirements of the Act. [Section 804 (f)(4)].

The vast majority of the fair housing complaints filed in the past 2 years in the State of Idaho contain allegations that these basic requirements of the Act have been violated. Many of the properties involved in these complaints have such features as: (1) steps up to the building, (2) steps at the entrances of the buildings, (3) thresholds of 4 inches or higher at the front door of the covered units, (4) no curb cuts for persons in wheelchairs in the sidewalks leading to units, and (5) bathrooms and kitchens that cannot be entered or used by persons in wheelchairs.

The Department published the Fair Housing Act Accessibility Guidelines in the Federal Register on March 6, 1991, with extensive participation by and comment from all of the major organizations representing the building industry. The Preamble to the Guidelines, which have been widely distributed to the building industry and the public since they were issued, stated, in part:

"The design specification presented in the Fair Housing Accessibility Guidelines provide technical guidance to builders and developers in complying with the specific accessibility requirements of the Fair Housing Amendments Act of 1988. The Guidelines are intended to provide a safe harbor for compliance with the accessibility requirements of the Fair Housing Amendments Act, as implemented by 24 CFR 100.205 of the Department's Fair Housing regulations. The Guidelines are not mandatory. Additionally, the Guidelines do not prescribe specific requirements which must be met, and which, if not met, would constitute unlawful discrimination under

the Fair Housing Amendments Act. Builders and developers may choose to depart from the Guidelines, and seek alternate ways to demonstrate that they have met the requirements of the Fair Housing Act.” [emphasis added]

This statement consistently has been, and remains, the Department’s position with respect to enforcement of the Fair Housing Act accessibility requirements. In the State of Idaho, for example, if HUD’s investigation of a property indicates that the builder has not relied on these guidelines, the builder and architect may present evidence that they have satisfied the requirements of the Act through alternative means.

On June 28, 1994, the Department published in the Federal Register further official guidance on the accessibility requirements of the Act, as “Supplement to Notice of Fair Housing Accessibility Guidelines: Questions and Answers about the Guidelines.”

In August 1996, the Department published a Fair Housing Act Design Manual. The purpose of this Manual, stated in its title, was to provide additional means by which designers and builders may meet the accessibility requirements of the Fair Housing Act. The Manual contained, explained, and illustrated the 1991 Fair Housing Act Accessibility Guidelines. Additionally, the Manual contained non-binding recommendations about how builders and developers could design accessible housing that met and, in some cases, exceeded the requirements of the Act.

In 1998, the Manual was revised to more clearly distinguish between the requirements of the Act, on one hand, and design elements that were merely recommended, on the other. The disclaimer was eliminated. The revisions appear in approximately 25 of the Manual’s 350 pages.

IDAHO FAIR HOUSING COUNCIL ACCESSIBILITY ISSUES

Question. In addition, it seems that the HUD grantee in Idaho, the Idaho Fair Housing Council, is suddenly filing large numbers of complaints, when previously there were very few and we still don’t have a single case of a disabled individual being denied housing. Can you explain the process that is used to control and oversee what the HUD grantees are doing in the states?

Answer. The number of complaints may seem large until you consider the number of Americans having disabilities. A 1997 Census Bureau publication reported that, at the end of 1994, 20.6 percent of the population, about 54 million people, had some level of disability, and 26 million people had a severe disability and 1.8 million Americans used a wheelchair. An additional 5 million used a cane, crutches, or a walker and had used these assistive devices for 6 months or longer.

The level of need for accessible units in Idaho is consistent with these national statistics. In a 1999 article in the Idaho Statesman, Kelly Buckland, Executive Director of the State Independent Living Council, states: “People with disabilities tell us over and over * * * that accessible and affordable housing is one of the two top issues for them in the state.” Buckland added:

“What you’ll hear from owners and builders is that there’s not that many people with disabilities. But 45 percent of the households in Idaho contain someone with a disability.”

Similarly, a January 24, an 1999 Idaho Statesman article told of two retirees who were evicted from their room in a home allegedly because the husband’s health deteriorated and he needed a ramp or handrail to get into the house.

We see our FHIP grantees as pivotal in protecting the rights of these Americans. The control and oversight for the FHIP grantees are pretty typical for grantees of any Federal agency.

To be funded, grantees must demonstrate the need for the proposed funding in their communities. HUD awards grants based on the extent to which their application demonstrates the need for such funding, among meeting other conditions, and then it negotiates a Statement of Work, and monitors the performance under that Statement of Work. Please note that in addition to the disability cases they brought, they referred to HUD numerous cases from people alleging a broad range of discriminatory practices, including discrimination on the basis of national origin and gender. The 1999 FHIP NOFA has some new requirements, which strengthen HUD oversight of the FHIP organizations. With two exceptions, all complaints resulting from HUD-funded activities must be filed with HUD. The exceptions are:

- a “bona fide” private complainant can opt-out by stating in writing (s)he does not want the complaint filed with HUD; and
- FHIP grantees are not to refer any complaint to HUD unless it is fully jurisdictional under the FHAct and supported by credible and legitimate evidence.

HUD will use these standards in negotiations with grant recipients. Moreover, HUD's upcoming GTR training in July will help HUD field staff better assess the quality of the deliverables, including complaint referrals.

FAIR HOUSING EDUCATIONAL AND TECHNICAL ASSISTANCE TO INDUSTRY AND
CONSTRUCTION PROFESSIONS

Question. I also have concern over the educational efforts in this area. GAO reports show that between 1989 and 1997, HUD made available more than \$98 million to private groups through the Fair Housing Initiative Program (FHIP) to work on enforcement activities, staff training and testing and complaint process. However, less than one percent of this funding was targeted to provide educational and technical assistance to the industry and construction professions. Can you explain how you expect building contractors to comply with HUD regulations if you don't educate and provide outreach to them?

Answer. We agree that education is critically important. In fact, if you look closely at the \$98 million figure cited in the GAO report, you will see that it includes \$23.4 million for the education and outreach initiative. So in other words, 24 percent of the total FHIP expenditures from 1989 to 1999 went to education and outreach. A portion of that figure included education and outreach efforts to industry and construction professions.

Ordinarily, education and outreach efforts are open to anyone interested, and a full range of affected groups and organizations are invited, which includes the various housing industry groups.

Generally, we would expect the building and construction industry to be aware of the accessibility requirements; compliance with the American National Standard Institute's standards (ANSI A117.1), which have been the standards for the building industry since 1961, constitutes compliance with the Fair Housing Act. This has been the case since the Act was amended in 1988 to include the accessibility standards. It is important to note again that the accessibility requirements are embodied in the legislation. HUD issued guidelines published in the Federal Register in 1991 and further guidance in the Federal Register in 1994. The Department has continued to provide additional guidance in a series of publications.

Looking at Idaho more specifically:

- HUD began holding seminars for local officials and the building industry in Idaho on accessibility requirements in 1994. Other seminars were held in 1996 and in 1997. The seminars covered both federally assisted housing projects and private housing developments. HUD continues to hold these seminars;
- In 1994, HUD's Idaho State office began distributing accessibility brochures for builders and architects;
- In September 1996, the Idaho Fair Housing Council wrote local officials throughout Idaho requesting their assistance in advising the affected building industry of the FHAct's requirements;
- Throughout 1997 and 1998, HUD engaged in dialogue with the City of Boise and its building department about notifying builders of the coverage and accessibility requirements of the Act;
- HUD awarded a Fair Housing Initiative Program grant to the National Association of Home Builders to conduct accessibility seminars across the country. One of those sessions was held in Boise, Idaho in 1998; and
- Recently, as an outgrowth of a conciliation agreement, a builder in Pocatello, Idaho sponsored a seminar on the accessibility requirements for the industry in eastern Idaho. Although 400 people were notified, fewer than 40 people attended, and most of those in attendance were code enforcement people.

REAL ESTATE AGENTS ACCESSIBILITY RESPONSIBILITIES

Question. I have heard from many real estate agents in Idaho who are concerned that they will be held liable for facilitating transactions of homes that do not meet the accessibility guidelines for the disabled. Can you clarify for me what position HUD has taken on this issue?

Answer. The Department's position is that real estate agents are not liable under the Fair Housing Act for facilitating transactions of homes that do not meet the accessibility guidelines for the disabled. The Department would not accept a Fair Housing Act complaint seeking to name a real estate agent as a respondent to the complaint based solely on the fact that the real estate agent facilitated a real estate transaction. Instead, a real estate agent or any other person who participated in the design or construction of a covered multifamily dwelling unit that does not meet the design and construction requirements of the Act, including as an owner of the property or as a property manager, however, would be an appropriate respondent to a

Fair Housing Act complaint. We expect that these instances will be exceedingly rare.

AVAILABLE HUD TECHNICAL ASSISTANCE ON FAIR HOUSING GUIDELINES

Question. In addition if a Realtor, or a consumer, were going to list a piece of property today, where would they go for technical assistance to determine if a property complies with the Fair Housing guidelines? Does HUD provide this information? If not, why not?

Answer. The Realtor or consumer seeking technical assistance on the Fair Housing guidelines should come to HUD. The Department will respond to telephone and written inquiries. As you can see from the listing below, the Department provides a number of documents and technical assistance materials that explain these requirements.

Item Number	Title
2440	24 CFR 1 Fair Housing Accessibility Reg.—24 CFR, Chapter 1 Questions and Answers
2429	Federal Register—Monday January 23, 1989 Part III 24 CFR 14 et al. Implementation of the Fair Housing Amendments Act of 1988; Final Rule
4826	June 28, 1994; Fair Housing: Accessibility Guidelines; Question and Answers; Supplement to Notice
4682	Architects and Builders: Are You in Compliance with the Fair Housing Act
4703	Seven Technical Requirement Brochure
4715	Fair Housing Act: Design Manual (WIRE-PALETED) (also order item #4889 with this item)
4725	Federal Register—March 6, 1991 Part VI—24 CFR Chapter 1 Final Fair Housing Accessibility Guidelines
4734	Cost of Accessible Housing
4889	Revision Sheets of Fair Housing Act Design Manual (also order item #4715 with this item)

In addition to the above, a 28:09 minute videotape “Accessible Housing: HUD Fair Housing Accessibility Guidelines” is available. Anyone can request any of these materials through:

- <http://www.hud.gov/> (under “handbooks/forms”)
- (202) 708-2313
- (800) 767-7468
- (800) 877-8339 TDD
- U.S. Department of Housing and Urban Development Directives Distribution Section Room B-100 451 Seventh Street, S.W. Washington, D.C. 20410

Some items are out of print, but print orders can be placed if there is demand for them.

MANAGEMENT AND MARKETING FIRMS FOR PROPERTY DISPOSITION

Question. As you know, last year Congress passed legislation that allowed HUD to change the process of granting contracts to local REAMs. Now HUD gives the contracts to companies known as “M&M’s. These Management and Marketing firms were intended to increase the turnaround time on reselling the homes. However, I have heard concerns from the state that this process is not working. Mr. Secretary, I am interested in how you would rate the success of this program so far and your opinion on whether it is accomplishing its goals? Additionally, can you tell me the current status of how Intown Marketing—the M&M in Idaho—is performing?

Answer. On March 29, 1999, the seven management and marketing contractors assumed responsibility for approximately 28,000 HUD-owned properties nationwide. Prior to this date, the Department removed approximately 16,000 properties from the market for sale to allow for the transition to the management and marketing contractors. The management and marketing contractors were required to resecure all of the transferred properties, reclean the properties and prepare new marketing plans for each property. Given this large-scale portfolio transfer, the contractors have been able to list approximately 25,000 properties for sale and sell approximately 15,000 properties in this 3-month period. Last fiscal year, the Department sold 64,536 properties. This is early in the assessment of the performance of these contractors. However, at the current rate of sales by the contractors, they have the ability to surpass the Department’s sales for a year by as much as 12,000 properties.

This is a promising trend and this type of performance is expected to continue throughout the contract period.

With regard to the performance of the Intown Management Group in Idaho, the Department initially transferred 28 properties to this contractor. There are currently 29 properties listed for sale while 21 properties have been sold since contract inception. The current numbers reflect the contractor's ability to list and sell properties in the Idaho area.

HUD'S FAIR HOUSING EDUCATION EFFORTS AND MEASUREMENT OF ITS EFFECTIVENESS

Question. HUD's fiscal year 2000 annual performance plan contains a goal to ensure equal opportunity in housing for all Americans. However, the objectives and performance indicators are predominantly related to managing complaints and enforcement actions. What strategies will HUD use to increase awareness of the fair housing provisions?

Answer. The Department believes strong action is needed to rid this nation of housing discrimination. Therefore, the Department is stressing enforcement of the Fair Housing Act in its Annual Performance Plan (APP).

As you suggest, however, enforcement actions are not the sole method for eliminating housing discrimination. HUD's strategy is to educate the housing industry and the public primarily through the FHIP program. In fact, \$15.75 million of the \$27 million total requested for FHIP programs in fiscal year 2000 would fund National Education and Outreach Grants program.

The following efforts to educate the building industry in Idaho about accessibility requirements exemplify HUD's strategies:

- HUD began holding seminars for local officials and the building industry in Idaho on accessibility requirements in 1994. Other seminars were held in 1996 and in 1997. The seminars covered both federally assisted housing projects and private housing developments. HUD continues to hold these seminars;
- In 1994, HUD's Idaho State office began distributing accessibility brochures for builders and architects;
- In September 1997, the Idaho Fair Housing Council wrote local officials throughout Idaho requesting their assistance in advising the affected building industry of the FHAct's requirements;
- Throughout 1997 and 1998, HUD engaged in dialogue with the City of Boise and its building department about notifying builders of the coverage and accessibility requirements of the Act;
- HUD awarded a Fair Housing Initiative Program grant to the National Association of Home Builders to conduct accessibility seminars across the country. One of those sessions was held in Boise, Idaho in 1998; and
- Recently, as an outgrowth of a conciliation agreement, a builder in Pocatello, Idaho sponsored a seminar on the accessibility requirements for the industry in eastern Idaho. Although 400 people were notified, fewer than 40 people attended, and most of those in attendance were code enforcement people.

Question. How will HUD measure the effectiveness of these efforts?

Answer. The APP states that the Department will conduct a survey to assess public knowledge of fair housing law. It will take the form of a random dialing telephone survey in 2000. The information resulting from this survey will form a baseline against which progress in educating the public about fair housing will be measured in subsequent surveys.

Question. Why doesn't the plan cover all these activities?

Answer. Outcome Indicator 2.1.3 of the APP calls for raising public awareness of fair housing law. It states:

"Public awareness of the law concerning fair housing reduces discriminatory actions, but no nationally available data exist to estimate the extent of awareness. This indicator tracks the effect of fair housing enforcement activities and of public information campaigns such as the National Education and Outreach Grants program on public understanding of their rights and responsibilities under the law."

HUD OVERSIGHT OF STATE DISABILITY RELATED ENFORCEMENT EFFORTS

Question. In 1989, the Fair Housing Act was amended to cover persons with disabilities. Shortly afterward, HUD delegated enforcement authority for these amendments to each state that had a statute that was equivalent to the federal law. Subsequently, HUD has issued more guidelines that expanded the requirements for building units that would comply with the amendments. What efforts has HUD taken to ensure that the states to which enforcement authority was delegated comply with the more recent guidelines?

Answer. State and local agencies are bound by their respective laws/ordinances/regulations. The Fair Housing Act (FHAct) requires that those laws be substantially equivalent—not identical to the FHAct. If a difference in interpretation arises between the State/local law and the FHAct after substantial equivalency status is awarded, the Department may determine the change is of such consequence that the law is no longer substantially equivalent or it may, by mutual consent, retain jurisdiction over certain categories of claims (i.e., the state would not handle certain categories of complaints). The Department would become aware of such differences in one of two ways: (1) the agency notifies the Department of the change, or (2) in assessing complaints processed by the agency for payment.

The Department provides guidance to substantially equivalent agencies in a variety of ways: annual HUD-sponsored training, technical assistance from the Government Technical Representative or local HUD enforcement office, direct mailings and on the HUD website.

Question. How does HUD monitor the enforcement activities in these states?

Answer. HUD monitors the activities of the agencies through technical assistance, on-site performance evaluations, review of the cases submitted by the agencies for payment, and training.

Question. How does HUD ensure that its enforcement activities in states where enforcement authority is not delegated is equivalent to the activities in other states?

Answer. In states that are not substantially equivalent, there is no delegation of enforcement authority. The Department maintains responsibility for processing all such complaints under the Federal Act.

QUESTIONS SUBMITTED BY SENATOR KYL

VIOLATIONS OF THE FAIR HOUSING ACT

Question. On October 28, 1998, HUD published a proposed Rule on “Fair Housing Performance Standards for Acceptance of Consolidated Plan Certifications and Compliance with Community Development Block Grant Performance Criteria.” It is my understanding that this Rule would have denied CDBG funds to any locality that was so much as accused of violating the Federal Fair Housing Act. In your view, is it fair to penalize communities that are merely accused of being in violation of the Fair Housing Act? Does the concept of due process not require that an actual violation—not the allegation of one—be found before communities are penalized?

Answer. HUD agrees it is not fair to penalize communities that are merely accused of being in violation of the Fair Housing Act and has never proposed any such approach. A “charge” of a violation of the Fair Housing Act by HUD is not mere accusation or allegation. Pursuant to the Fair Housing Act regulations, HUD may only issue a charge after HUD has:

- determined that the allegations state a claim under the Fair Housing Act;
- determined that the claim is timely;
- determined that the complainant has standing to assert the violation;
- notified the respondent of the Fair Housing Act complaint;
- permitted the person to submit any evidence that responds to the allegations;
- investigated the complaint, including exculpatory evidence;
- attempted to conciliate the complaint; and
- based upon its full investigation and all evidence submitted by both parties, determined that reasonable cause exists to believe a discriminatory housing practice has occurred.

The issuance of such a charge requires the concurrence of HUD’s Office of General Counsel.

The proposed rule does not address or change the existing due process requirements in the Consolidated Plan and CDBG program regulations. The due process already required by HUD regulations for CPD actions would continue to apply to the disapproval of the affirmatively furthering fair housing certification in the Consolidated Plan and to the imposition of corrective actions to address deficient affirmatively furthering fair housing performance under the CDBG program. In other words, the fair housing matters would be subject to exactly the same due process requirements that apply to CPD concerns.

Question. I understand that HUD did not adequately consult with cities and fair housing advocates before drafting and publishing this Rule. Given that the Rule has been withdrawn, does HUD intend to work with city leaders and fair housing advocates to draft new fair housing guidelines that have the understanding and support of the stakeholders?

Answer. HUD did not issue a final rule on this; HUD issued a proposed rule. The Administrative Procedures Act normally calls for a consultation process before an agency issues a final rule. The consultation process ordinarily consists of notifying the public of the proposed rule through publication in the Federal Register and giving the public the opportunity to comment on the proposed rule. The issuing agency then examines the comments and considers them.

HUD fully complied with these Administrative Procedures Act requirements. In fact, HUD extended the comment period and invited numerous groups (including a briefing with representatives from the House Majority staff of the Housing Subcommittee on Housing and Community Opportunity) to discuss their views during this comment period. As a result of these consultations, HUD withdrew the proposed rule. HUD intends to continue the process of consultation with interested parties to arrive at a rule which more clearly states HUD's policy.

Question. I understand that many communities never received feedback from HUD on the adequacy of proposals to address impediments to fair housing in their comprehensive plans. Don't you think there should have been some constructive educational action taken before HUD attempted to impose punitive measures as proposed in the Rule?

Answer. While HUD does not require prior submission and approval of a jurisdiction's analysis of impediments to fair housing choice, it promptly responds to complaints or concerns expressed by local citizens and groups. This may involve a review of the analysis and supporting documents. In addition, HUD will carefully review the performance indicators under the Consolidated Plan to measure the jurisdiction's progress toward meeting its fair housing goals.

To assist communities in implementing their analysis of impediments to fair housing choice, HUD conducted 22 training sessions nationwide during the summer, fall, and winter of 1997. These sessions were attended by over 1,700 people representing CDBG and HOME grantees, public housing agencies, fair housing organizations, and housing industry groups. These sessions educated participants about the rights of their constituents to fair housing planning.

In 1996, HUD published a Fair Housing Planning Guide which provided information on how to conduct an Analysis to Fair Housing Choice, undertake activities to correct the identified impediments, and the types of documentary records to be maintained.

FAIR HOUSING GUIDELINES RELATING TO GROUP HOMES

Question. Many communities in Arizona feel that HUD's fair housing guidelines do not grant them adequate authority to reasonably regulate group homes within their boundaries. For example, minimum spacing requirements and occupancy limits are routinely interpreted by the federal government as being in violation of the Fair Housing Act. The intent of these regulations is not to prevent group homes from being able to operate and provide necessary services; rather, the intent is to allow group homes to operate in greater harmony with the character of the neighborhoods in which they exist. The fiscal year 2000 budget proposed for HUD contains \$47 million for "Fair Housing Activities." Can you assure me that HUD will not expend funds to investigate citizens who, in protesting the placement of group homes, are merely exercising their First Amendment Rights?

Answer. HUD responsibilities for enforcement of the Fair Housing Act are subject to the Constitutional protections of free speech. HUD continues to adhere to specific guidelines that ensure that citizens' First Amendment rights are protected as HUD processes claims that may involve freedom of speech issues. All FHEO staff are bound by these guidelines. Moreover, the Department acknowledges the Senate's direction in our Appropriations Act for the last several years, which states that the Department may not "investigate or prosecute...any otherwise lawful activity...engaged in solely for the purpose of achieving or preventing action by a governmental official."

Question. Why should the Fair Housing Act not be amended to allow communities greater, but reasonable, control over the placement of, and the number and type of occupants in, group homes within their boundaries?

Answer. The issues localities raise regarding group homes are not best addressed in statute. A cooperative effort among all parties involved, including localities, housing provider groups, civil rights organizations and federal enforcement agencies, rather than the unnecessary restructuring of a historic civil rights statute, is a more positive and productive approach.

A comprehensive, non-legislative approach to the group home issue is appropriate because much of the controversy generated on the issue involves such non-federal matters as licensing and monitoring. The scope of community concerns regarding

group homes go beyond Fair Housing Act considerations and, in fact, consists mostly of concerns regarding licensing, monitoring, and compliance with local ordinances.

Question. I understand that HUD had planned to release fair housing guidelines in October 1994 that would clarify for localities what actions they could take or not take with respect to group homes. Those guidelines were never issued. Why?

Answer. While HUD has not issued formal policy guidelines regarding group homes, on October 4, 1995, HUD responded in detail to questions from the League of Cities regarding the role of the Department on zoning-related issues. HUD has taken other actions in several areas regarding group homes, including:

- agreeing to coordinate discussion of the group home issue among interested parties at the request of the U.S. Conference of Mayors;
- meeting with key Department of Justice (DOJ) staff to discuss appropriate, non-legislative responses to group home issues;
- meeting with representatives of the National League of Cities to discuss group home concerns;
- meeting with representatives of the Coalition to Preserve the Fair Housing Act, an ad hoc grouping of civil rights, disability and national community organizations, to discuss group home concerns;
- attending, in an “observer” capacity, a meeting organized by the National League of Cities designed to discuss non-legislative responses to issues raised by pending legislation;
- meeting with the Department of Health and Human Services Assistant Secretary for Planning and Evaluation to discuss group homes, and obtaining information from HHS on state regulation of group homes; and
- reviewing HUD programs which may involve group homes.

QUESTIONS SUBMITTED BY SENATOR CAMPBELL

NAHASDA

Question. Though you have repeatedly recognized the “third world conditions” of Indian housing, fiscal year 2000 funding for the Native American Housing Assistance and Self-Determination Act (NAHASDA) Block Grant did not receive the requested 10 percent increase that the rest of HUD and its programs received. If Native American housing represents the worst in the nation, why did it not receive a 10 percent increase in requested funding?

Answer. Although the Department’s overall Budget request for fiscal year 2000 reflects an increase, the increase was not spread evenly across all programs. However, the President’s fiscal year 2000 Budget request continues to support the fiscal year 1999 Budget increases provided for the Indian Housing Block Grant (IHBG) program, the Section 184 Indian Housing Loan Guarantee Fund and the Indian Community Development Block Grant program. Other programs proposed for fiscal year 2000 from which Indian Tribes and their Tribally Designated Housing Entities are expected to benefit include the Welfare-to-Work Section 8 Voucher Program (25,000 units requested), and Service Coordinators for the Elderly, proposed to be funded at \$50 million.

As the implementation of IHBG progresses, the Department must ensure that tribal management and operational capability exists. Some larger tribes now receive significantly more funding post-NAHASDA than they received under pre-NAHASDA programs. The Department is confident that the funding proposed for Indian programs in the President’s fiscal year 2000 Budget request is the optimum amount that can be prudently managed in Indian Country while maintaining the integrity of both the programs and Federal funds.

NAHASDA

Question. The Committee on Indian Affairs has received complaints from tribes regarding the confusion over NAHASDA’s environmental review process, inadequate consultation, and lack of Title VI implementation. Please describe the Department’s proposals to address each of these matters.

Answer. The Department’s proposals to address (a) environmental, (b) consultation and (c) Title VI implementation concerns of the Committee on Indian Affairs are as follows:

a. *Environmental Concerns.*—The Department has taken a number of initiatives to eliminate confusion about the tribal environmental review process. Prior to the passage of NAHASDA, HUD maintained the lead role in ensuring that affordable housing activities complied with the National Environmental Protection Act (NEPA) and related laws. Under NAHASDA, tribes may either perform such reviews or re-

quest HUD to conduct them. While most tribes successfully perform their environmental reviews, a few tribes have started projects without completing the requisite environmental reviews. Of 27 environmental problems discovered recently, virtually all have been resolved successfully without any loss of grant funds.

Basic environmental training has been provided by the Department at 11 locations throughout the United States to over 300 NAHASDA grantees and Office of Native American Programs (ONAP) staff. During the remainder of this calendar year, HUD will conduct advanced training for grantees and ONAP staff at approximately 12 additional locations. Other actions include:

- 1. each ONAP Office has a designated Environmental Liaison Officer to provide technical assistance, and provide guidance, as requested;
- 2. publication and distribution of an Environmental Guidebook to all grantees; and
- 3. a memorandum to be issued shortly to all Area ONAP Administrators detailing environmental review requirements, along with technical guidance on how to proceed when defects in environmental reviews are discovered.

The Department's primary objectives are twofold: (1) to continue to work with tribes until they are capable of assuming the environmental requirements, and (2) to monitor and promote environmental regulatory compliance.

b. *Consultation Concerns.*—The Department strongly supports the concepts of Indian self-determination and the government-to-government relationship. The Department has had an American Indian and Alaska Native Consultation Policy in place since 1994. That document, issued in response to the President's Memorandum of April 29, 1994, reaffirmed the government-to-government relationship between Federally recognized Indian tribal governments and the United States government. The Office of Native American Programs subsequently conducted regional consultation sessions on the policy throughout Indian Country and received input from tribal leaders on how best to implement it.

On May 14, 1998, the President issued Executive Order 13084, which required Federal agencies to develop an effective process for elected officials of tribal governments to provide meaningful and timely input in the development of regulatory policies that would significantly or uniquely affect Native American communities.

During the March 1999, "Shared Visions: The Native American Homeownership, Legal and Economic Development Summit I," in Chicago, the Department presented a revised draft consultation policy and procedures document to tribal leaders and other participants. At that time, Secretary Cuomo met personally with tribal leaders to express the Department's commitment to tribal consultation.

More recently, on June 4, 1999, the Department released a letter to all tribal governments inviting them to participate in redrafting the Department's consultation policy. The letter explained the Department's initiative, included an Action Plan, and requested their active participation in developing the final policy.

c. *Title VI Implementation.*—The Title VI Tribal Housing Activities Loan Guarantee Program was announced on July 23, 1998. To ensure that the \$6 million loan guarantee program is implemented successfully, the Department contracted with a TA and capacity-building provider using a \$3 million Rural Housing and Economic Development Initiative grant. The contractor may work directly with tribes, or act in coordination with another Technical Assistance (TA) provider of the applicant's choice. In either case, TA will be provided free of charge to applicants. The grant is expected to help ensure that proposals are well-conceived, and should increase every applicant's chances for success.

As of June 12, 1999, the contractor, IHA Management Systems, reports that they are assisting six tribes/tribally designated housing entities develop a Title VI loan project plan. Three additional potential participants have taken the required preliminary steps toward project development.

NAHASDA

Question. Some tribes, including Lower Elwha, Yakima Nation, and Coeur d'Alene have experienced situations where HUD has informed the tribes that a one page environmental review document was 'incomplete' and consequently, all NAHASDA money was to be returned to HUD. What will HUD do to ensure that the environmental review process is better communicated to tribes?

Answer. In addition to the steps outlined in the above response on this issue, the Department has issued guidance to the six Area ONAP Administrators that no NAHASDA grant funds will be withdrawn due to environmental infractions without a thorough and fair assessment of the matter with the grantee.

NAHASDA

Question. Tribal leaders have expressed concerns to both the Committee on Indian Affairs and HUD regarding the lack of consultation. President Clinton has directed, through an Executive Order, that all agencies promulgate a written consultation process. Though HUD states that it has a written consultation process with American Indians and Alaska Natives, obviously, this process has some wrinkles in it. What tangible steps have been taken to improve the consultation process after the implementation of NAHASDA?

Answer. The Department strongly supports the concepts of Indian self-determination and the government-to-government relationship. The Department has had an American Indian and Alaska Native Consultation Policy in place since 1994. That document, issued in response to the President's Memorandum of April 29, 1994, reaffirmed the government-to-government relationship between Federally recognized Indian tribal governments and the United States government. The Office of Native American Programs subsequently conducted regional consultation sessions on the policy throughout Indian Country and received input from tribal leaders on how best to implement it.

On May 14, 1998, the President issued Executive Order 13084, which required Federal agencies to develop an effective process for elected officials of tribal governments to provide meaningful and timely input in the development of regulatory policies that would significantly or uniquely affect Native American communities.

During the March 1999, "Shared Visions: The Native American Homeownership, Legal and Economic Development Summit I," in Chicago, the Department presented a revised draft consultation policy and procedures document to tribal leaders and other participants. At that time, Secretary Cuomo met personally with tribal leaders to express the Department's commitment to tribal consultation.

More recently, on June 4, 1999, the Department released a letter to all tribal governments inviting them to participate in redrafting the Department's consultation policy. The letter explained the Department's initiative, included an Action Plan, and requested their active participation in developing the final policy.

NAHASDA

Question. Why has HUD eliminated funding for the Title VI program under NAHASDA?

Answer. Although not requested as a separate program, the President's fiscal year 2000 Budget request does, in fact, propose \$5 million for Title VI within the requested appropriation for the Indian Housing Block Grant.

QUESTION SUBMITTED BY SENATOR LEAHY

SECTION 8 PROJECT-BASED CONTRACTS

Question. I have heard from many Vermonters about the affordable housing crisis in our state. The number of Vermonters waiting for federal housing assistance has steadily grown and the waiting list for people seeking Section 8 rental subsidies has been as high as 2½ years. I support your efforts at addressing this crisis with the addition of 100,000 new rental assistance vouchers.

However, I did notice in GAO's January report on HUD's Major Performance and Management Issues, that there remains a concern identified originally in a July 1998 GAO report. The concern is over HUD's ability to adequately monitor funds that are no longer needed for specific Section 8 project-based contracts. GAO reports that if HUD had identified and deobligated these funds, it could have recaptured and used them to reduce the Department's request for Section 8 funding. Your budget summary mentions that the Department began last year with a comprehensive reform of the administration of Section 8 project-based contracts. What steps has the Department taken under the 2020 reform plan to address this problem? Have you taken steps to recapture these deobligated funds.

Answer. The principal reform proposed by the Department with respect to the administration of project-based section 8 contracts is our initiative to expand the use of contract administrators. Currently, such contract administration is used only for state housing agency financed projects. The Department now has issued a solicitation of interest to identify potential administrator for the balance of our project-based section 8 portfolio. These contracts will be performance-based to provide incentives for more effective administration, and will free up civil service personnel in our field offices for other pressing multifamily management and development responsibilities.

With respect to the issue of recaptures of remaining balances on section 8 contracts that have reached their initial expiration date, the Department has focused considerable attention on developing a means of identifying such balances available for recapture which minimizes staff-intensive effort and avoids the potential for deobligating funds needed to satisfy owner claims or adjustments which can occur following contract termination. While these procedures are being refined, in August, 1998, a total of \$412 million was recaptured, and in November, another \$1.29 billion was identified and recaptured. These amounts are being applied against the \$1.65 rescission enacted in the fiscal year 1999 Appropriations Act. The Department is in the process of preparing for another round of recaptures this summer which coincides with a large number of additional initial contract expirations, particularly in the Loan Management Setaside (LMSA) inventory. Initial estimates indicate that up to \$1.5 billion may be available for recapture from these contracts. This recapture was anticipated in the Administration's pending budget request for fiscal year 2000, which assumes the use of \$2 billion from such recaptures to offset the requirement for new appropriations to meet program level requirements for contract renewals and amendments.

SUBCOMMITTEE RECESS

Senator BOND. We thank you, Mr. Secretary——

Secretary CUOMO. Thank you.

Senator BOND [continuing]. For a worthwhile hearing.

And rather than ending with a whimper, we will end this hearing with a bang. Thank you.

Secretary CUOMO. Thank you, sir.

[Whereupon, at 11:40 a.m., Thursday, April 22, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

**DEPARTMENTS OF VETERANS AFFAIRS AND
HOUSING AND URBAN DEVELOPMENT AND
INDEPENDENT AGENCIES APPROPRIATIONS
FOR FISCAL YEAR 2000**

THURSDAY, APRIL 29, 1999

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 9:30 a.m., in room SD-138, Dirksen Senate Office Building, Hon. Christopher S. Bond (chairman) presiding.

Present: Senators Bond, Burns, Craig, Kyl, Mikulski, Leahy, Lautenberg, Harkin, and Byrd.

ENVIRONMENTAL PROTECTION AGENCY

STATEMENT OF CAROL M. BROWNER, ADMINISTRATOR

ACCOMPANIED BY:

SALLYANNE HARPER, CHIEF FINANCIAL OFFICER

PETER ROBERTSON, ACTING DEPUTY ADMINISTRATOR

OPENING STATEMENT OF CHRISTOPHER S. BOND

Senator BOND. Good morning, the subcommittee will come to order. We meet this morning to take testimony from the Environmental Protection Agency and the Council on Environmental Quality for the Administration's fiscal year 2000 budget request for these agencies.

We also have three pieces of testimony for the record from the General Accounting Office on EPA information management concerns, the Superfund program, and the new Chemical Safety and Hazard Investigation Board.

We welcome EPA Administrator Browner, Deputy Administrator Peter Robertson, the Chief Financial Officer Sallyanne Harper and the rest of the EPA team. We, also, welcome for the first time before the subcommittee CEQ acting chairman George Frampton.

Today marks the last day of hearings for the fiscal year 2000 cycle for this subcommittee. Our next step will begin to craft the fiscal year 2000 VA-HUD bill. This is going to be a very difficult task this year because the caps imposed by the budget agreement will result in a real reduction of almost \$30 billion in discretionary spending below the current level. Within this subcommittee's portfolio there are many critical requirements. One of our most significant concerns will be veterans' medical care. The President's budg-

et proposes no increase for veterans' medical care despite increases in many other programs and agencies. Yet VA has identified more than \$1 billion in unbudgeted needs associated with treating patients with Hepatitis C, providing emergency care in non-VA hospitals, homelessness activities and long-term care for the aging veteran population.

Without some increase in the budget, VA expects to lay off about 8,500 personnel in its hospitals. This process has already begun and many members of this subcommittee are hearing from their constituents about the problems in their VA facilities. We, on this subcommittee, are committed to ensuring that the quality of care in VA medical facilities does not in any way deteriorate because of the budget situation, and based on my prior experience with this bill, I can assure you that an overwhelming bipartisan majority in the United States Congress will feel the same way.

We can also expect FEMA disaster relief requirements for fiscal year 2000 of several billion dollars which has not been budgeted for. FEMA's annual disaster relief costs are running close to \$3 billion and we have no reason to believe we won't have disaster costs next year in keeping with historical averages.

In fact, there is a laundry list of other concerns I could cite. Clearly with an allocation which is expected to be well below last year's level, coupled with many critical requirements within this subcommittee's portfolio, every agency's budget request will be scrutinized closely and we'll have a tough time meeting the President's request in many, if not, most instances, for additional funding.

EPA's budget request totals \$7.2 billion. This is a reduction of \$384 million below current levels because EPA has cut the State Revolving Fund for clean water infrastructure by \$550 million as well as other congressional priorities. However, many of other activities are slated for significant increases and one major new program is proposed. The budget includes \$3.7 billion for the operating programs, an increase of 5.5 percent over current levels; \$1.6 billion for the trust funds, including \$1.5 billion for Superfund; and 1.9 billion for air and water and infrastructure financing.

Unfortunately, once again there is no evidence that the budget request is based on priorities which will best protect the environment and improve human health. Instead it appears that political considerations, pet projects and photo ops may be guideposts used in putting this budget proposal together. Let me give you one simple example. You proposed a \$200 million grant program called the Clean Air Partnership Fund for which there is no specific authorization, no stated criteria, no clearly defined goals. This program has been likened by some early analysts to a "funded unmandate." Meanwhile, after funding the new unmandate with the catchy slogan, the President's budget slashes the Clean Water State Revolving Fund by over a half a billion dollars, a program which has a specific purpose, a specific authorization and an enormous identified unmet need.

I just do not believe that is right. We all know the Clean Water SRF has a proven track record. It helps meet an EPA-identified, nationwide need which last year was put at \$140 billion for waste water infrastructure financing and which results in demonstrable

improvements in water quality of our nation's rivers, lakes and streams. The Federal investment in capitalization grants to date has been roughly doubled through leverage bond proceeds and state matching funds, making this a greater Federal state partnership. It is a program which works and which is needed.

And we all understand what EPA's primary responsibilities are supposed to be. It's on your Web site. The mission of the EPA is to protect human health and safeguard the environment, air, water and land upon which life depends. Apparently somebody at OMB did not log on to the mission statement. The Agency's budget request is only \$800 million for clean water infrastructure, a cut of some \$550 million.

It's particularly curious that this effective program is being cut despite the President's statements that clean water is a top environmental priority. And even more astonishing is that this cut comes about as your own agency is revising, we believe upwards, the actual unmet need. While tremendous progress has been made in improving water quality since passage of the Clean Water Act 27 years ago, much remains to be done. About 40 percent of surface waters today are not clean enough to support such basic uses as fishing and swimming. To put it plainly, EPA proposes a cut of 41 percent to the Clean Water SRF, an effective program designed to meet specific Federal water quality mandates.

Let's understand what we are talking about. Summer is just around the corner. More than 46 million school children in this country are getting ready for a vacation. The vacation spots of their choice will be our nation's beaches, rivers, lakes and streams. That is why I call on you and the EPA to get back to the basics. Let's revisit the priorities. Let's ensure that our children and families are protected, not backpedal on the progress we've made. Let me assure everyone that one of the highest priorities that I will pursue, to the extent our allocation will allow, will be restoring the cut to the Clean Water State Revolving Fund.

The second example I'd cite of concern is the President's proposed doubling of the Climate Change Technology Initiative to \$216 million, again, as far as I can tell, not based on a national assessment of rational priorities but seemingly due to political considerations. At the same time, EPA proposes to cut drinking water research even while the agency acknowledges it will have insufficient data to meet the mandate to promulgate new drinking water regulations in the next few years. Yet compliance costs associated with some of the new regulations likely will be great. EPA officials themselves told GAO investigators that the new demands cannot be met by shifting resources, without sacrificing quality or missing statutory deadlines. Initial EPA estimates is that annual funding shortfall for research and data collection will be in the range of \$10 million to \$20 million per year for fiscal years 1999 through 2005. That this activity should be cut while doubling the Climate Change Technology Initiative and creating a new clean air program seems to defy logic.

Once again, it looks as though the EPA is more interested in channeling money into new programs and questionable pet projects while at the same time slashing the vital programs that we have for our basic environmental needs. It begs a question: Why? Why

should we slash these programs when they are the ones that are the basic mission and the ones that we know work?

EPA has requested \$63-plus million for children's health but at the same time the scientific magazine Chemical and Engineering News said as of June 1998, because all air pollutants have fallen in the past 20 years, trying to associate falling air pollution with increasing asthma rates flies in the face of logic. We support activities to improve the health and well-being of children but we must support activities which are grounded in science, not simply what we wish science to be.

The Inspector General has listed ten major management concerns at EPA, number one being accountability. We are concerned about EPA's forays into land use planning and transportation issues. The IG has also raised considerable concerns regarding inadequate oversight by EPA in its grants and assistance agreements despite the recognition since at least 1996 that this was a problem. We intend to hold EPA fully accountable.

We also have concerns regarding EPA's implementation of the Government Performance and Results Act. The Results Act needs to be focused on effective outcomes, not bean counts.

One of the items in this accountability list is environmental data systems. We have raised this question before because we cannot know if environmental goals are being met if data is of a questionable quality. Again, the EPA Inspector General has cited information systems as a major management issue.

We commend the starts that have been made but I've not seen enough progress. We can't be confident about the quality of the data. EPA often publicizes data without any stakeholder consultation or even advanced notice and without taking any responsibility for the accuracy for the data. There is still no data correction process. We don't, in some instances, know how useful the data is, even if it's accurate. EPA told us last year it would be conducting a survey of the needs of American households but we have not seen that. There has been a suggestion that the number of EPA web site hits is a good measure. I don't think that is the best performance measure for EPA's right-to-know goals.

Finally, there still is no data quality action plan. We acknowledge that EPA has begun to create the new information office to be a one-stop shop. That is a good step but we need to see EPA take aggressive action to establish the office quickly and make sure it has the authority to see that all EPA offices adhere to the standards set forth. We plan to hold the head of this office accountable for the quality and integrity of the data EPA releases.

I would, also, note in passing very serious concerns about computer security. The Inspector General has said that the preliminary results of ongoing work indicate a number of significant and pervasive problems with the adequacy of existing security plans for EPA's core financial systems and regional systems.

Touching briefly on the Superfund program, I'm pleased that EPA is meeting its site cleanup goals but we still have significant concerns reflecting the GAO's concerns. And I'm disappointed that the administration apparently is not willing to engage in an honest, constructive dialogue on legislative reforms.

We are, also, concerned about EPA's reinvention initiatives and whether they are languishing. We have made little progress on these as these activities continue to operate at the margins of EPA.

Finally, in many agencies reinvention has meant carrying out missions in a more cost-effective manner, doing more with less. We have seen this in the Veterans Health Administration which has lost some 20,000 employees in the past several years while increasing the number of patients it treats by more than 10 percent. We have seen significant reductions at the Department of HUD. Yet at EPA there has been a significant growth in the workforce, but we don't know whether there has been a commensurate increase in work performed. States have taken on more and more of the responsibility for environmental programs. More than 70 percent of the programs which can be delegated are now being run by the States. And according to the Environmental Council of the States, between 1993 and 1998 the percent of the delegated programs grew from 41 percent to 71 percent. And in the past decade there has been an increase of 60 percent in the number of staff in state environmental agencies.

Yet EPA's own workforce has grown tremendously. Since 1990 the EPA workforce has grown by more than 3,000 and in that time we have seen only three new pieces of major environmental legislation. In my 4 years as chairman of this subcommittee, the number of EPA work-years has grown by about 500.

Ms. Browner, you have made the workforce your highest priority. In the fiscal year 1999 operating plan you cut key programs such as NPDES permits and the Reinventing Environmental Information Initiative in favor of increasing staff above the prior-year level. Given that States are doing more and more, this priority raises questions with me. We have to ask, what are all these people doing? Only EPA's workforce, of all the major agencies' workforces under the jurisdiction of this subcommittee, has been growing in the past few years.

Let me be clear that I believe that much of the work of the subcommittee will be to set funding priorities for your agency to ensure that our environmental programs work effectively and efficiently. Congress has made a commitment to protecting our environment both for this generation and for those to come. To fulfill that commitment, we have to get back to the basics for EPA.

PREPARED STATEMENT

There are many, many issues. Believe it or not, I had a much longer opening statement which I ask unanimous consent to submit in full in the record. Otherwise I will read it. Hearing no objection, it will be so included in the record.

[The statement follows:]

PREPARED STATEMENT OF SENATOR CHRISTOPHER S. BOND

The Subcommittee will come to order. We meet this morning to take testimony from the Environmental Protection Agency and the Council on Environmental Quality on the administration's fiscal year 2000 budget request for these agencies. We will also have 3 pieces of testimony for the record from the General Accounting Office on EPA information management concerns, the Superfund program, and the new Chemical Safety and Hazard Investigation Review Board.

We welcome EPA Administrator Browner, Deputy Administrator Peter Robertson, Chief Financial Officer Sallyanne Harper, and the rest of the EPA team. We also welcome for the first time before this subcommittee CEQ Acting Chairman George Frampton.

Today marks the last day of hearings for the fiscal year 2000 budget cycle for this subcommittee. Our next step will be to begin crafting the fiscal year 2000 VA-HUD bill. It will be an arduous task, as the caps imposed by the budget agreement will result in a real reduction of almost \$30 billion in discretionary spending below the current level.

Within this subcommittee's portfolio, there are many critical requirements. One of our most significant concerns will be veterans medical care. The President's budget proposes no increase for veterans medical care, despite increases in many other programs and agencies. Yet VA has identified more than \$1 billion in unbudgeted needs associated with treating patients with hepatitis C, providing emergency care in non-VA hospitals, homelessness activities, and long-term care for the aging veteran population.

Without some increase in the budget, VA expects to lay-off about 8,500 personnel in its hospitals. This process has begun already, and many members of this subcommittee are hearing from their constituents about problems in their VA facilities. We are committed to ensuring that the quality of care in VA medical facilities does not in any way deteriorate because of the budget situation.

We can also expect FEMA disaster relief requirements in fiscal year 2000 of several billion dollars, which has not been budgeted for. FEMA's annual disaster relief costs are running at close to \$3 billion, and we have no reason to believe we won't have disaster costs next year in keeping with historical averages.

In fact there is a laundry list of other concerns I could cite. Clearly, with an allocation which is expected to be well below last year's level, coupled with the many critical requirements within this subcommittee's portfolio, every agency's budget request will be scrutinized closely and we will have a tough time meeting the President's request in many—if not most—instances.

EPA's budget request totals \$7.2 billion. This is a reduction of \$384 million below current levels because EPA has cut the state revolving fund for clean water infrastructure by \$550 million and other Congressional priorities. However, many other activities are slated for significant increases, and one major new program is proposed.

The budget includes \$3.7 billion for the operating programs, an increase of 5.5 percent over current levels; \$1.6 billion for the trust funds including \$1.5 billion for Superfund; and \$1.9 billion for air and water infrastructure financing.

Unfortunately, once again, there is no evidence that the budget request is based on priorities which will best protect the environment and improve human health. Instead, it appears that political considerations, pet projects and photo ops are the guideposts used in putting together this budget proposal.

Let me give you one simple example—your proposed new \$200 million grant program—called the Clean Air Partnership Fund—for which there is no specific authorization, no specific criteria, and no specific goals. This program has been likened to a “funded un-mandate.”

Meanwhile, after funding the new un-mandate with the catchy slogan name, you slash the clean water state revolving fund by over a half billion dollars, a program which has a specific purpose, a specific authorization, and an enormous identified unmet need. That is just not right.

We all know the clean water SRF has a proven track record, helps meet an EPA-identified nationwide need of at least \$140 billion for water infrastructure financing, and results in demonstrable improvements to the water quality of our nation's rivers, lakes and streams. The federal investment in capitalization grants to date has been roughly doubled through leveraged bond proceeds and state matching funds, making this a greater federal-state partnership. It is a program which works.

And we all understand what EPA's primary responsibility is supposed to be. It is on your website: the mission of the EPA is to protect human health and safeguard the environment—air, water and land—upon which life depends. But apparently EPA does not log onto its own mission, as Ms. Browner, your agency's budget request is only \$800 million for clean water infrastructure. That's a cut of \$550 million for water infrastructure in this country.

It's particularly curious that this effective program is being cut despite the President's statements that clean water is a top environmental priority. And even more astonishing is that this cut comes about as your own agency is revising—upwards—the actual unmet need.

While tremendous progress has been made in improving water quality since passage of the Clean Water Act 27 years ago, much remains to be done. About 40 per-

cent of surface waters today are not clean enough to support such basic uses as fishing and swimming.

To put it plainly, EPA proposes a cut of 41 percent to the clean water SRF, an effective program designed to meet specific federal water quality mandates.

And let's understand what we are talking about. Summer is just around the corner. More than 46 million schoolchildren in this country are getting ready for vacation. The vacation spot of their choice will be our nation's beaches, rivers, lakes and streams. That's why I am calling on you, and the EPA, to get back to the basics. Revisit your priorities. Let's ensure that our children and families are protected—not backpedal on the progress we have made.

Let me assure everyone, one of our highest priorities to the extent our allocation will allow, will be restoring the cut to the clean water state revolving fund.

A second example of concern is the President's proposed doubling of the Climate Change Technology Initiative to \$216 million, again, not based on any rational assessment of priorities, but seemingly due to political concerns.

At the same time, EPA proposes to cut drinking water research even while the agency acknowledges it will have insufficient data to meet the mandate to promulgate new drinking water regulations in the next few years. Yet compliance costs associated with some of the new regulations likely will be great.

EPA officials themselves told GAO investigators that the new demands cannot be met by shifting resources without sacrificing quality or missing statutory deadlines. Initial EPA estimates are that the annual funding shortfall for research and data collection will be in the range of \$10 million to \$20 million per year for fiscal years 1999 through 2005.

That this activity should be cut while doubling the climate change technology initiative and creating a new clean air program defies all logic.

Once again it looks as though the EPA is more interested in channeling money into dubious pet projects and undefined new programs, while at the same time slashing the vital programs that ensure we have safe and clean water. This not only unacceptable, it begs the question WHY? Why would EPA slash these vital programs?

EPA also requests \$63.2 million for its children's health initiative, with a major emphasis on childhood asthma, which EPA attributes to air pollution. It is interesting to note, however, that air quality has steadily improved over the past decade. A June 1998 article in the scientific magazine *Chemical & Engineering News* said "because all air pollutants have fallen in the past 20 years, trying to tie falling air pollution with increasing asthma rates flies in the face of logic."

Let me be clear—we support activities to improve the health and wellbeing of our children. But we must support activities which are grounded in science—not simply what one wished the science to be.

Another major emphasis in EPA's budget is the Better America Bonds Initiative. EPA would have authority to select proposals for \$1.9 billion in bonding authority for projects aimed at creating open spaces and restoring urban areas. While no specific request is made in EPA's budget, EPA funding would be required for the administrative costs associated with running the program.

There are major concerns with EPA playing a role in local land use decisions. This is another example of EPA seeking to pursue new activities, without any specific Congressional direction or authority, while many other mandated activities go without adequate attention. We must remember, local land use decisions are just that, local decisions.

The Inspector General in its list of 10 major management concerns at EPA lists as Number 1, accountability. EPA's forays into land use planning and transportation issues would seem to imply EPA does not believe it is accountable to the Congress and the specific laws set out for it. Before starting up new programs, the agency should consider the many critical activities that come from specific statutory mandates that seem to be getting short shrift.

With respect to concerns about the lack of accountability at EPA, the I.G. tells us that regional offices are acting largely autonomously, often not spending appropriated funds consistent with designated purposes; and enforcing regulations inconsistently. These are not new concerns, but apparently they have not been deemed important enough to be addressed in an aggressive manner by EPA leadership.

The I.G. has also raised considerable concerns regarding inadequate oversight by EPA of its grants and assistance agreements. Despite EPA's recognition since at least 1996 that this was a problem, it continues to be a material management control weakness. We must be able to hold EPA fully accountable for the billions of dollars in annual grants, assistance agreements and contracts it oversees.

We also have concerns regarding EPA's implementation of the Government Performance and Results Act, which relate closely to our concerns about accountability.

The Results Act was intended to see that agencies be measured based on their performance, not “bean counts.” Yet in EPA’s annual plan, only about 40 of the roughly 320 performance measures—13 percent—that EPA has set forth are true environmental indicators, as opposed to bean counts. EPA continues to focus heavily on traditional measures such as the number of permits issued, inspections conducted or reports written.

A significant aspect of EPA’s ability to implement fully the Results Act is having environmental data systems that are timely, accurate and useful. We cannot know whether environmental goals are being met if EPA data is of questionable quality. Yet again this year, the Inspector General cites environmental data information systems as a major management issue. This is an issue this subcommittee focused a great deal on in last year’s hearing, and while commitments were made, I’m afraid not enough progress has been made.

EPA has 500 data systems, most of which operate with different standards and definitions, and often contain data which is out of date or simply inaccurate. One of EPA’s 10 goals is “Expansion of American’s right-to-know about their environment.”

Yet we can’t be confident about the quality of the data. EPA often publicizes data without any “stakeholder” consultation—or even advance notice—and without taking any responsibility for the accuracy of the data. There is still no data correction process. And data is often put out for purposes other than that for which it was collected, leading to possible inappropriate conclusions about the information.

In many instances, we don’t know how useful the data is, even if it is accurate. EPA last year told us it would be conducting a survey by early this year of environmental information needs of American households. Apparently this has become a lower priority as EPA does not plan to complete a survey and report until the fall.

I would suggest that the number of EPA web site “hits” is not the best performance measure for EPA’s right-to-know goal. We need to find out how useful the information is to Americans.

Moreover, there still is no final data quality action plan—which was committed to last year; there is no information plan, which GAO cites as a critical need; we have seen no actual burden reduction for facilities reporting to EPA; and many activities, such as creating common facility identifiers, have been in the pipeline for so long we wonder whether they are losing momentum and whether there is commitment to completing them.

We acknowledge that EPA has begun to create a new information office ostensibly to be the “one-stop shop” to provide uniformity in the agency’s approach to information management, and to address the need to ensure that data is accurate, reliable, and consistent. This is a good step.

But we need to see EPA take aggressive action to establish the office quickly, and ensure it is vested with the authority it needs to see that all EPA offices adhere to the standards it sets forth. We don’t want to repeat the problem we’ve seen in the area of peer review, where the office which developed the polio,—the R&D Office—followed peer review procedures, but other program offices ignored it.

Let me be clear—We plan to hold the head of this office accountable for the quality and integrity of the data EPA releases.

We also have serious concerns about computer security. The Inspector General stated, “The absence of a centralized validation process leaves vast amounts of EPA information vulnerable to unauthorized access, manipulation and potential destruction. The preliminary results of ongoing work indicate a number of significant and pervasive problems with the adequacy of existing security plans for EPA’s core financial systems and regional systems.”

While the I.G. recommended in 1997 that EPA implement formal firewall technology and implement a Network Security Policy, EPA has dragged its feet in responding. According to the I.G., the agency firewall is not scheduled for implementation until the spring 2000. Protecting sensitive business information and ensuring that appropriate firewalls are in place must be an immediate top priority of the new information office and top agency leadership.

Moving on to the Superfund program, I’m pleased EPA is meeting its site cleanups goals. However, there remain significant concerns with this program. GAO continues to list it as a high-risk program, as it has for the past decade, citing concerns with the way its contracts are managed, excessive overhead costs, and the cost-recovery program. In addition, there remain significant impediments to fair and efficient site cleanups, owing to the litigious nature of the program and other problems that only legislative reforms can fix.

For that reason I’m very disappointed to have heard that this administration is no longer willing to engage in honest, constructive dialog on legislative reforms.

We also have concerns about EPA's so-called reinvention initiatives and whether they are languishing. We have been talking for many years now—and there have been scores of reports and studies on the need for flexibility and innovative approaches. But it seems we've made very little progress as these activities continue to operate at the margins of EPA.

Finally, in many agencies reinvention has meant carrying out missions in a more cost-effective manner—doing more with less. We have seen this in VA, which has lost some 20,000 employees in the past several years while increasing the number of patients it treats by more than 10 percent.

Yet at EPA there has been significant growth in the workforce, but I'm not sure we've seen a significant increase in work performed. Indeed, in the past decade, states have taken on more and more of the responsibility for environmental programs. More than 70 percent of programs which can be delegated are now being run by the states. According to the Environmental Council of the States, between 1993 and 1998 the percent of delegated programs grew from 41 percent to 71 percent. And in the past decade there has been an increase of 60 percent in the number of staff in state environmental agencies devoted to carrying out EPA mandates.

Yet EPA's own workforce has grown tremendously at the same time. Since 1990, EPA workforce has grown by more than 3,000, yet in that time we have seen only 3 new pieces of major environmental legislation. During my tenure as chairman of this subcommittee, total EPA workyears have grown by about 500!

Ms. Browner, you have made the workforce your highest priority. In the fiscal year 1999 operating plan, you cut key programs, such as NPDES permits and the reinventing environmental information initiative in favor of increasing staff above the prior year level. Given that states are doing more and more, this priority seems not to make sense. We must ask, what are all these people doing? Of all the major agencies under this subcommittee, only EPA's workforce has grown in the past few years.

In conclusion, let me be clear that I believe much of the work of this subcommittee will be to set funding priorities for your agency to ensure that our environmental protection programs work effectively and efficiently. Congress has made a commitment to protecting our environment both for this generation and those to come, and to fulfill that commitment we must get EPA back to the basics.

There are clearly many issues we wish to discuss today. Before I ask you, Ms. Browner to proceed with your opening statement, I will turn to my distinguished ranking member Senator Mikulski for her opening statement.

Senator BOND. And before I ask you to begin, Madam Administrator, I will turn to my colleagues and first call on the distinguished ranking member of the subcommittee, Senator Mikulski.

STATEMENT OF SENATOR BARBARA MIKULSKI

Senator MIKULSKI. Thank you very much, Mr. Chairman. My own remarks will be condensed in light of the fact that we have many members here as well as a vote at 10:30.

I want to welcome Administrator Carol Browner and her team. This is her seventh appearance before this subcommittee. And I want to thank her for her efforts and leadership over the years and also her tenacity in surviving this 7 years of attacks on EPA. Her tenure has neither been boring nor uneventful. Budget cuts, shutdowns and catastrophes have made her job quite challenging. In addition, there is often been a kind of hostility around protecting the environment. And I would hope, as we examine the culture of attack in our society, we need to learn more about civility among ourselves. Hopefully, it will even start on the Senate floor.

Today I am going to focus on the issues related to the environment because in my own home state, which I believe is a cameo for the nation, first of all, good environment is good business. Good environment is good business in Maryland because of the Chesapeake Bay.

Whether it is the bounty that comes from the Bay that sustains our watermen, our restaurants, our charter fishing and our resi-

dential development; the Bay has been bountiful and we need to protect the Bay and I'm very appreciative in Senator Mathias, to myself, to President Reagan to President Clinton to focus on the Bay.

But also, environmental protection has been good business for Maryland. I want to get into also the whole issue of environmental technology. In my own home state the development of new technology to provide the private sector with tools for either environmental cleanup, remediation or even detection for early warning before it would get to a problem is resulting in the fact that there are thousands of jobs being created, export jobs that absolutely crucial.

The other is the issue around the cleanup of the environment. And I want to, also, see what efforts and progresses are being made in brownfields. From a legislative standpoint, we're making very little progress on Superfund but brownfields, I believe, offers a cornucopia of opportunity. Again, in my own home state, there are 3,000 acres of brownfields around the waterfront of three counties. Redevelopment of these brownfields could result in commercial, cargo, residential and other new types of office park development that would really be a cornucopia of economic development for my state.

So those are the kinds of things that we want to focus on. But we, also, want to make sure that there continues to be the establishment of a very clear link between public health and the environment. We want to know about what is happening in clean air, what is happening to our children with asthma. The epidemiologists at Hopkins in Maryland tell me asthma is skyrocketing throughout the nation and is probably one of the number one health issues facing America's children.

In addition to that, again, looking at public health, there is the issue of *Pfiesteria* in the Bay and several other waters. So we want to go through the budget. We want to make sure the budget does match policy, and policy matches national priorities. And I believe our national priority is, we protect the environment not only for itself, but because of its linkage to public health and economic development.

So we look forward to hearing your testimony and, of course, we want to know you are Y2K-ready. Thank you very much.

PREPARED STATEMENT

I ask you now with your consent that my entire statement go into the record.

Senator BOND. Without objection, it will be.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BARBARA A. MIKULSKI

Thank you Mr. Chairman. I want to welcome EPA Administrator Carol Browner and her team. This is Ms. Browner's seventh appearance before the subcommittee. I want to thank her for her efforts and leadership over the last seven years.

Administrator Browner's tenure has not been boring and uneventful. Budget cuts and government shutdowns have made Ms. Browner's job—and the job of EPA's employees—quite challenging.

In addition, there has often been a climate of hostility toward environmental protection in the Congress as a whole, particularly in the authorizing committees.

This has not made for the most constructive climate within which to move our agenda. I believe that EPA has survived these challenges and has taken many initiatives to make the long-term changes that are necessary to keep up with a changing world.

As a Senator for Maryland, I have seen the positive results of EPA's programs and initiatives on a firsthand basis.

As a Marylander, I am also well aware of the importance of one of our most precious resources—water.

Water links the lives of all Marylanders—from the north branch of the Potomac River, to the southern tip of the Wicomico River, water is critical to Maryland's environment and economy. The EPA has been a leader in keeping Maryland's Chesapeake Bay and waterways clean.

I also want to take this opportunity to highlight two sometimes overlooked aspects of environmental protection. First, with the help of the EPA, I believe we need to make all Americans aware of the strong connection between public health and environmental protection.

Unfortunately, we have seen examples all across the country of the negative effects of a poor environment on the health of our citizens. We need to ensure that our environment and our people are protected.

We also need to do all we can to clear up the misconception that our economy and our environment cannot prosper together. Nothing could be further from the truth. Our economy and our environment can indeed coexist. In fact, they must.

I believe that environmental protection goes hand in hand with economic growth and job creation. Protecting our environment creates jobs.

In Maryland, our watermen have always relied on a clean bay for their livelihood. A clean bay means more jobs for our watermen.

But Maryland's economy is benefitting from a new industry—environmental technology.

Environmental laws and regulations create the need for new environmental technologies. New technologies means new jobs and new markets. The United States sets the standards for many areas in environmental protection.

In Maryland alone, there are 1,700 companies in the environmental industry. These companies have created 21,000 jobs in Maryland, and have exported \$260 million worth of goods and services.

The demand for these types of businesses will only grow in the coming years. According to the EPA, the global market for environmental technologies and services is now estimated at \$410 billion per year. Current growth rates range from 3 to 4 percent a year in most industrialized nations to 16 percent in parts of Asia.

This represents incredible opportunities for jobs in Maryland and across the country.

As we move forward in today's hearing, let me note a few of the things that I am pleased to see in EPA's fiscal year 2000 budget request. First, I would like to note that the President has requested \$7.2 billion for EPA for fiscal year 2000.

I am pleased to see an increase in funding for the President's clean water action plan.

I believe we must ensure the integrity of our core water programs, while we seek to broaden our base of knowledge and understanding of water issues.

I was pleased to join the President in my hometown of Baltimore when he outlined this plan to ensure clear waterways and safe ecosystems.

The President's clean water action plan will promote water quality protection by emphasizing state initiatives and new guidelines for regulating animal waste.

This is a critical issue in my state of Maryland as we wrestle with how to respond to the *pfisteria* outbreaks that ravaged our waterways—waterways which are crucial to the economy of our state.

Mentioning the topic of *pfisteria* leads me to note that I consider this year's hearing in many ways a follow-up status check.

I would like to know what progress EPA has made in working internally and with other agencies to address the *pfisteria* problem.

I'd like to know what progress has been made in identifying not only the problems, but workable solutions.

I know you are aware Ms. Browner, just how important the waterways are to the Maryland economy. Thousands of Maryland watermen, commercial fishermen, merchants and restaurants depend of the great seafood that is harvested in our beautiful waters.

It is imperative that EPA and other relevant agencies work together and with the states to continue to find workable solutions to the *pfisteria* problem—solutions that are based upon sound science.

This year is also a follow-up year on the brownfields program. I know the chairman shares my concern about the need to revitalize our nation's brownfields.

My hometown of Baltimore has over three thousand acres of brownfields. This is land that could be cleaned and revitalized to help create jobs and rebuild communities.

I want to hear this morning what progress EPA has made with its brownfields initiative and what progress it has made in coordinating activities with HUD.

This program is too important and too necessary to fall victim to mismanagement or lack of clear direction.

I will continue to work with the chairman to stand sentry to ensure that we have a brownfields program that works for the taxpayers and works for the communities that receive brownfields dollars.

I am interested to learn what the EPA has done to implement the NAPA recommendations. I'd like to know what has been done to date and what plans are in place to accomplish those things remaining undone.

As you know, when I was chair I requested that NAPA do a report on how EPA could improve its management and operations. That report became the basis for yet another NAPA report that continued evaluating the progress EPA had made.

These reports are not meant to be reports for reports sake. These NAPA reports and the recommendations they include are to be blueprints for positive, action and results oriented change.

I know the chairman shares my desire to see EPA use the NAPA reports as frameworks for improved performance based management.

I am also aware of some concerns with the implementation of the food quality protection act. I want to make sure that we have a program that is open, uses the best science available, and works effectively to protect consumers from illnesses and death caused by polluted foods.

So, Madame Administrator, I know that your plate is full and that you are busy. I commend you again for your efforts and look forward to working with you and the chairman on making the Environmental Protection Agency one that truly fulfills its critical mission.

Thank you Mr. Chairman.

Senator BOND. We are very honored to have the ranking member of the full committee with us today and I'd ask Senator Byrd if he wishes to make some statements.

Senator BYRD. Mr. Chairman, that's very nice. I will take my turn. I do thank you, however, very much.

Senator BOND. Thank you, Senator.

Senator Leahy.

Senator LEAHY. Thank you, Mr. Chairman, I'll happy to yield to the distinguished Senator.

Senator BYRD. You overwhelm me with praise. [Laughter.]

Senator BOND. Would one of you gentleman please proceed?

Senator CRAIG. Mr. Chairman, I would be happy—

Senator BYRD. Mr. Chairman, I am thoroughly enjoying this. But I think I will wait. I will learn a lot by listening to my peers.

STATEMENT OF SENATOR PATRICK J. LEAHY

Senator LEAHY. Thank you, Mr. Chairman.

Administrator Browner, it is good to have you here. As you know, there will always be a lively debate over priorities of your agency. Last week Secretary Babbitt was testifying before this subcommittee. I think it is a toss-up probably as to who has endured more bruises during your tenures, you or he. But I see that as a credit to your leadership at EPA and your commitment for improving our environment, not just for us but for our children. They are the ones that are going to live most of their lives in the next century.

That same perspective has motivated my agenda in the Senate trying to improve my own state of Vermont for future generations.

We have been—we are very grateful for the fact that in Vermont, that you have been up there and visited our State. You have seen how the funding you have requested for Lake Champlain is going to help us achieve this goal. Lake Champlain's watershed covers more than half of our state. In other words, revitalizing the health of Lake Champlain is essential not only to our environment but also to our economy. From the funding from your agency we are going to be able to meet the challenge of improving both the environment and the economy at the same time.

For example, one project that may seem mundane, but has a great effect on the whole lake ecology, is a monitoring program to help our dairy farmers choose the most effective way to reduce agricultural runoff into Lake Champlain.

We have another project that I would like to see EPA get involved in. I have scraped together some seed money for two pilot projects that integrate economic and natural resource data into a web-based interactive tool that could help communities access everything from the impact of a new gas station or shopping center on their watershed. I would like to expand the pilot program to cover the entire Lake Champlain basin. I hope EPA can be one of the primary Federal partners.

I want to compliment you also and your staff for your work on two very high-profile issues in Vermont, the cleanup of the Pownal Superfund site and the Lake Memphremagog partnership with the Department of Agriculture.

My wife was born a hundred yards from the shore of Lake Memphremagog on the Vermont side. Had she been born a hundred yards further, she would have had the same Canadian citizenship her parents had.

I was very impressed with how quickly and professionally your staff developed remediation plans embraced by the community and the State's environmental officials. And the Lake Memphremagog partnership to reduce agriculture runoff is such a success, we are going to try to replicate it for the Connecticut River.

Mr. Frampton is not here. But I was going to thank him, also, for his help with the Northern Forest funding. I will put the whole statement in the record. Mr. Chairman, we will also have a markup at the same time in the Judiciary Committee on a constitutional amendment.

Senator BOND. Senator Lautenberg.

STATEMENT OF SENATOR FRANK R. LAUTENBERG

Senator LAUTENBERG. Thanks, Mr. Chairman. I will try to be brief and ask unanimous consent that my full statement be included in the record.

Mr. Chairman, I just briefly want to commend Carol Browner, the EPA Administrator, for the great job that she's done. And as Senator Mikulski noted that she is not either battle- or weather-weary, despite the number of contests and conflicts she has had to endure.

It strikes me as being rather peculiar that we are looking at the reduction in funding for EPA that we are, when the record of success is greatly astounding. We hear lots of criticism and talk about the bureaucratic influence and decision making and how tough it

is to live with the rules and regs. I would like to note, Mr. Chairman, that we have—by the end of the fiscal year, that 95 percent of the Superfund sites will have had signed records of decision. That 50 percent of the contaminants that used to plague our air have been eliminated. That 150 million people in this country breathe cleaner air as a result of the work that's done at EPA. And we are—that thousands of brownfield sites, whether it is those that are cleaned up by State or Federal Government or private contractors under the supervision of the Federal Government, have been released for economic and community use.

I think the record is pretty darn good. And I must tell you I find it discouraging—I know that we have other priorities—but I think that we ought to be examining all of our priorities in the same fashion. “Look at the record” used to be a favorite expression. And I want to commend Administrator Browner and her team for the great work that they're done, again, sometimes under very severe pressure.

PREPARED STATEMENT

I hope, Mr. Chairman, that we are going to be able to find of a way take care of the funding to get a Superfund bill. The Chairman sits on the same committee that I do, the EPW Committee, and I am hoping that we can enact sensible Superfund legislation to keep that program going. It will help enormously in terms of our financing the programs that we have to.

Thank you, Mr. Chairman.

[The statement follows:]

PREPARED STATEMENT OF SENATOR FRANK R. LAUTENBERG

Mr. Chairman, I am pleased to be here to discuss EPA's fiscal year 2000 Budget with Administrator Browner, and the fiscal year 2000 Budget for the Council on Environmental Quality with Acting Chairman George Frampton.

I would like to take this opportunity to commend Ms. Browner for the job she is doing at the helm of EPA. I have had the good fortune to work with her closely over these last several years, but had the distinction of spending even more time with her than usual during the Superfund negotiations of the previous Congress.

She is an outstanding leader for environmental protection.

As the ranking member of the Budget Committee, I can understand the difficulties this Subcommittee faces in trying to adequately fund its environmental programs.

Even though we have erased the deficit, and are expecting large surpluses in the next five years, we are still living with the tight domestic discretionary caps from the Balanced Budget Agreement.

Despite this outlook, I hope that this Subcommittee will strongly consider proper investment for EPA's environmental protection programs.

We need to do whatever we can to provide appropriate funding for Superfund, the Clean Water Act, the Clean Air Act and other critical programs. If not, we will not make enough progress in cleaning up our land, water and air.

Mr. Chairman, I know it will be tough to fund all of the competing priorities in this Subcommittee. I know you and the distinguished ranking member will do your very best to fund EPA's critical programs because environmental cleanup is needed in all states. You did an outstanding job with this bill last year, and look forward to no less this year.

But let's face facts, it will be very tough. But we can still work together to make the right investments in environmental protection. And I look forward to working with members on both sides of the aisle, along with Administrator Browner, to make this happen.

Thank you

Senator BOND. Thank you, Senator Lautenberg. We will be coming forward with some ideas. We will be working with your staff on EPW. Now I turn to the distinguished Senator from West Virginia.

Senator BYRD. Mr. Chairman, these two gentlemen who are here were here before I was.

Senator BOND. No, sir. I watch them closely. You do not think I actually listen to those statements I am reading, do you? I'm watching who is coming into the room.

Senator BURNS. We are not ready anyway, Senator.

Senator BYRD. I am not ready either, as a matter of fact. [Laughter.]

Just so this time is not counted against me, Mr. Chairman.

Senator BOND. We are not so foolish as to put the lights on.

Senator BYRD. Is there a vote at 10:30?

Senator BOND. Yes, sir.

Senator BYRD. Will we be coming back?

Senator BOND. I will. I hope that some of my colleagues will. It gets lonely up here.

TRANSPORTATION PARTNERS PROGRAM

Senator BYRD. Madam Administrator, you are very senior to me in this area. Let me ask you about the EPA program known as Transportation Partners. The EPA program known as Transportation Partners has recently come to my attention through some published reports that make some rather disconcerting charges. Primary among those charges is that this program is a source of funding for some purely anti-road initiatives. I can certainly see the merit in a program that helps local communities to help develop volunteer strategies for transportation-related emission reductions and that assists them in developing transportation alternatives that reduce traffic volume and congestion.

It seems that if EPA is actually helping to underwrite activities to block construction authorized, of desired, safer, more modern highways, a critical line is being crossed. I have no doubt that the public would be dismayed to hear it if, in fact, as one Federal agency is spending millions of taxpayer dollars to build modern infrastructure, another agency was spending additional taxpayer money to help prevent such construction.

The logical result of this kind of mess is that the taxpayers end up paying several times over, including footing the bill to fight court battles to defend the projects and covering the costs of inflation resulting from lengthy construction delays. The only beneficiaries from this kind of scheme, it would seem, are the lawyers. This scenario simply defies fiscal logic. I would like to know more about the Transportation Partners program. Does anyone at EPA conduct oversight of the program? What is the answer?

Ms. BROWNER. Do you want me to answer?

Yes, we do. It is a grant program and it is subject to all of the requirements of our program and the oversights associated with our grant programs.

Senator BYRD. Can you then tell the committee specifically how this funding is being spent?

Ms. BROWNER. Yes, we can. I would be happy to spend a moment to elaborate on the program, if that would be helpful at this point.

Senator BYRD. Well, we have the time if you do.

Ms. BROWNER. Yes, certainly. [Laughter.]

I apologize, Senator Byrd, I had thought the chairman wanted to finish with the opening statements. So I apologize.

Senator BYRD. Perhaps I am mistaken.

Senator BOND. We did have this time for opening statements, Senator Byrd. We were going to go into the question round later. This is an area in which I have a great interest. If you wish to do that, I will ask the indulgence—

Senator BYRD. Mr. Chairman, I think it is unfair to the other members to proceed with questions.

Senator BURNS. Senator, I am submitting my statement. So you may proceed. You are not walking on any toes over here.

Senator CRAIG. I concur.

Senator BYRD. Well, I am glad the Administrator is calling my attention to my error.

Ms. BROWNER. Senator, that is not my intent. I simply want to follow the lead of the Chairman and the subcommittee.

Senator BURNS. We do want to let the Administrator make her full statement before getting into full-blown questions. But this is a question that I believe, Madam Administrator, you can answer because this is of major concern to me and to Senator Byrd.

Senator BYRD. Mr. Chairman, I am embarrassed to feel that, being my first occasion to sit on this subcommittee, I have misread the tea leaves and am proceeding out of order.

Senator BURNS. No, you are not either.

Senator MIKULSKI. There no alligators from the Everglades to worry about.

Ms. BROWNER. I would be happy to answer the question, Senator Byrd.

Senator BYRD. Since our time is limited, I would prefer to wait until the others have had a chance. I've got several questions on this.

Senator BOND. Thank you very much, Senator. I assure you I have concerns in this area. We look forward to working with you.

We propose to introduce two pieces of legislation that will protect the EPA's role and the Department of Transportation's role. Since you and I had a great deal to do with the passage of the Clean Air Act, the Byrd-Bond amendment, as it is known up here, or the Bond-Byrd amendment as it's known in Missouri, enabled to us to develop an emissions trading system which facilitated the passage of the Clean Air Act and we want to see the goals of clean air and safer highways achieved. So we will be having many discussions on that.

Senator Burns, do you have an opening statement?

Senator BURNS. I would ask that I may submit it in the interests of time and protocol.

Senator BOND. I'd be delighted and without objection.

Senator Craig, do you have an opening statement?

Senator CRAIG. Under those conditions, welcome to the committee.

Senator BOND. With that, Madam Administrator, would you like to give your opening statement?

Ms. BROWNER. Yes. Before I do that I just want to assure the committee that I am more than happy to answer any question, but particularly the questions that have been proposed by Senator Byrd and by the Chairman——

Senator BOND. There will be plenty of opportunity.

Ms. BROWNER [continuing]. Concerning transportation and other important matters.

STATEMENT OF CAROL M. BROWNER

It is, indeed, a pleasure to appear again before you, Mr. Chairman, Senator Mikulski and the members of this committee, and it is a great honor to have Senator Byrd here and showing an interest in our programs. We thank you for that.

I am here today to present the President's fiscal year 2000 budget request for the Environmental Protection Agency. The President's \$7.2 billion request for the EPA continues this administration's efforts to protect both public health and our environment while providing states and communities with new innovative funding tools to build these strong, healthy and safe communities that we all desire for the 21st century.

As you noted, Mr. Chairman, accompanying me today are many of the senior managers from the Agency, including our Chief Financial Officer, Sallyanne Harper, who is beside me at the table. If I might, Mr. Chairman, just take a brief moment to say a word about Sallyanne Harper. She just won a very, very prestigious award from the Joint Financial Management Improvement Program. They pick one Federal financial officer a year, government-wide, one State officer, and one local government officer for this award. Sallyanne Harper was the winner this year for the entire Federal Government and she is an outstanding public servant and she does a tremendous job for us at EPA.

Senator BOND. Ms. Harper, we congratulate you and commend you for your good work. You certainly have challenging opportunities ahead of you, and we wish you the best.

Ms. BROWNER. We are very proud to have her.

Mr. Chairman, with the help of the members of this subcommittee, you have provided essential funding for important environmental programs. With that funding we have made significant progress for the people of this country in providing a safe and a healthy environment. During this administration we have also worked with Congress to pass in a bipartisan manner important environmental laws and to implement earlier laws to carry out our common goal of stronger environmental protections.

If I might just take a moment to cite a few examples. Over the past 6 years we have worked together to pass environmental laws such as the Safe Drinking Water Act Amendments of 1996. We estimate today that 88 percent of the American population receive drinking water from a system that meets all health-based standards, 88 percent. That is a truly remarkable statement about the commitment of the Congress, the commitment of the EPA, to working with local communities to ensure that every time their citizens turn on the tap, it is clean, healthy, safe water that they receive.

Thanks to the resources provided by this committee, we have also made significant progress in many of the key action items in the Clean Water Action Plan which the President announced in Maryland almost a year ago. We recently announced a joint strategy with the USDA to protect waterways from nonpoint source pollution associated with the largest animal feeding operations. We have made significant progress to clean up toxic waste sites. As of the end of 1998, 585 Superfund toxic waste sites have been cleaned up. An additional 85 cleanups will occur in 1999.

In addition, 227 communities have benefited from more than \$44 million in grants to revitalize brownfields, to see these sites cleaned up, to see these sites redeveloped, to see them made a productive part of the community. And, finally, because of the Clean Air Act approximately 164 million Americans are today breathing cleaner air.

The budget we present today is in the tradition of every previous budget submitted by this administration. It is based on what the President and Vice President have said time and time again, and what we have proven over the last 6 years. We do not, as a country, have to choose between our health, our environment and our economy. That, in fact, a strong economy and a healthy environment are goals in concert, not in conflict.

Today we have some of the toughest environmental and public health protections in the world and our economy is also strong. It is literally soaring. Building on this record of success, the Clinton-Gore 2000 budget request charts a new course to meet the environmental challenges of the coming century.

The budget we put before you today is about communities. It is about neighborhoods. It is about protecting where we live our lives as Americans. It is about protecting how we live our lives. It is about keeping communities healthy, strong and prosperous. It is about families. It is about improving their quality of life, especially for our children.

The President in his State of the Union address articulated a new livability agenda to help communities grow in ways that will ensure a high quality of life and strong sustainable economic growth. A key part of this agenda is an innovative financing tool called Better America Bonds. This plan offers a creative way for states and communities, through zero interest bonding authority, to preserve open space, create shared areas and parks, clean up brownfields and improve water quality.

Mr. Chairman, I want to be very clear what this program is not. It is not big government. It is not the Federal Government owning anything. This is merely another tool for those communities who want to preserve their open spaces, who want to enhance their water quality. They choose whether or not to take advantage of it. They are not required to participate. Across the country many communities are looking for financing mechanisms so they can provide these kind of open spaces, these shared spaces, this enhanced quality of life.

The President's budget also includes \$200 million for the Clean Air Partnership Fund, another new tool to help communities. You made reference to this, Mr. Chairman, in your opening comments. This is a fund to allow those local communities who want to look

at creative alternative solutions to local air pollution problems, with some modest resources so they can develop these sorts of local solutions. No one is required to participate. We hear from many communities, from many mayors who would like to forge public and private sector partnerships to develop local air pollution solutions. That is what this is designed to do, to provide some modest resources for those communities who want to take this approach to enhancing their air quality and thereby their quality of life.

Third, this budget allows EPA to take a leading role in the administration's important effort to fight the growing problem of childhood asthma. Five million children suffer from this debilitating disease, and the incidence is clearly on the rise. Senator Mikulski made reference to the very, very good work that is done at Johns Hopkins. The budget before you includes \$22.2 million for education, outreach and monitoring to reduce children's exposure to the environmental toxins that can make an asthma attack far worse.

I am aware that this is a concern, Mr. Chairman, that I think we both share. Your work on children's issues as both Governor and Senator has done much to ensure that our children are well prepared for a healthy lifetime of achievement. I hope that we can continue to work together as EPA reaches out to communities to provide them with the tool to address this very real, this growing problem of childhood asthma.

In addition to these three new initiatives, the President's budget also continues our work on the nation's other environmental and public health priorities. To implement the Clean Water Action Plan \$651 million, the national blueprint announced last year to finish the job of restoring and protecting our nation's rivers, lakes and coastal waters.

For the State Revolving Funds \$1.6 billion, to upgrade drinking water systems, and waste water systems. To help communities address the very pressing problem of polluted runoff, we are asking that this committee allow States to take up to 20 percent of their waste water money and turn it into a grant program.

There are many small and medium-sized communities, where the next important step to protecting their river or lake is addressing polluted runoff. A grant program funded through an optimal 20 percent setaside of the Clean Water SRF administered by the States, would be a very, very important tool for communities.

To continue the cleanup of toxic waste sites, the budget invests \$1.5 billion in Superfund, of which almost \$92 million will go directly to support brownfields communities.

If I might, just in closing, call the committee's attention to something that is a very, very important concern to me and to the administration, and that is the agency's operating programs. We are seeking an increase in those programs. That is where we do almost everything, short of the money for Superfund and brownfields and the money that goes to States. Everything from setting a drinking water standard to rigorous science, to a new information office, to getting an "A" on our Y2K compliance efforts, all of what we do sits in the operating program budget. We are very, very concerned that if we do not have the resources in this section of our budget, the work that is extremely important to the American people will be

delayed or in some instances, we will simply have to cease that work. We are concerned about this because of the House- and Senate-passed budget resolution that includes a 12-percent across-the-board-cut in priority domestic programs. We are concerned that that magnitude of a cut to our operating program will result in a huge delay or stoppage of important efforts that we are involved in.

For example, it would affect our ability to set drinking water standards on target with the new law. We have not missed a deadline. The budget before you allows us to continue that record, but a 12-percent cut would be extremely difficult——

Senator BOND. Madam Administrator, let me assure you that the assumptions in the budget have absolutely nothing to do with what kind of 602B allocation EPA will receive or how this committee will allocate it.

Ms. BROWNER. I appreciate that.

Senator BOND. I think you can disregard most of the assumptions underlining the budget. It is the numbers that count and we are the ones that deal with the numbers.

Ms. BROWNER. I appreciate that. I take it from your words that you recognize the importance of our operating budget.

Senator BOND. Merely that we are going to have no intention of being bound by those assumptions.

Ms. BROWNER. In closing, Mr. Chairman, we want to continue to work with this committee. We do recognize that congressional earmarks are a part of the budgeting process. I think many of the projects are extremely worthwhile projects, and are important to the local communities. But as the number of those earmarks increases, it does function as a reduction in our ability to meet our commitments, both to States and local communities, and affect our ability to do the kind of work that was envisioned by Congress as they passed and reauthorized and strengthened the nation's environmental laws.

In the last 4 years, we have experienced a 300-percent increase in congressional earmarks to our budget. I am not suggesting that the earmarks are not important projects. I am sure they are, but they do affect our ability to do our job. Mr. Chairman, they also affect the money that is made available to the States for their priorities. We provide a lot of funding to the States and they manage it across a set of competing needs. An earmark comes at the expense of the dollars we have available to provide to the States.

I raise that concern to the committee. I understand the realities. But I hope that we can work together to ensure that we do not continue to experience the kind of growth in earmarks and to really, if possible, look at the projects and determine whether or not they are better funded through an existing set of resources that we make available to a State.

PREPARED STATEMENT

In closing, let me thank you for the opportunity to be here. Let me thank you for the opportunity to work with you. We recognize it is a difficult budget year, and that there will be difficult choices to make. We believe we have presented you with a budget in keeping with the balanced budget agreement that honors the commitment that the Congress and the President made to the American

people in reaching that balanced budget agreement, which was to provide strong public health and environmental protections for the American people.

[The statement follows:]

PREPARED STATEMENT OF CAROL M. BROWNER

Chairman Bond, Ranking Member Mikulski, and Members of the Committee, I am very pleased to be here today to present the President's fiscal year 2000 Budget Request for the Environmental Protection Agency. The President's \$7.2 billion request for the EPA continues this Administration's efforts to protect public health and the environment and provide states and communities with new, innovative funding tools to help build strong, healthy communities for the 21st century.

At the outset, Mr. Chairman, I would like to mention something we at EPA are very proud of. Sallyanne Harper, the Agency's Chief Financial Officer, has been named the recipient of the Joint Financial Management Improvement Program's (JFMIP) 1998 Donald L. Scantlebury Memorial Award. She receives this in recognition of sustained leadership and a record of accomplishments in financial management at EPA. This is an extremely prestigious government-wide award given by the JFMIP, to recognize senior financial management executives who, through outstanding and continuous leadership in financial management, have been principally responsible for significant economies, efficiencies, and improvements in federal, state, or local government. Sallyanne has done a great job for us at EPA. I just wanted to share with you our pride in Sallyanne and ask you to join me in congratulating her.

Mr. Chairman, with the help of this Subcommittee, which has funded essential environmental programs, we have made significant progress in providing a safe, healthy environment for the American people. During this Administration, we have also worked with Congress to pass important environmental laws and to implement earlier laws to carry out our common goal of stronger environmental protections. To cite just a few recent examples:

This year, as a result of the Safe Drinking Water Amendments of 1996, we estimate that 88 percent of the American population will receive drinking water from community water systems that meet all health-based standards in effect since 1994. The Agency has had remarkable success in carrying out those Amendments, and, to date, has not missed a single deadline that Congress placed in the law. We are honoring the commitments you made in passing this legislation, and we are meeting the safe drinking water needs of the American people.

Because of the action of this Subcommittee, and particularly your support Mr. Chairman, and that of Senator Mikulski, we have made significant progress on many of the 111 key action items in the Clean Water Action Plan and will soon announce a joint strategy with USDA to protect waterways from non-point source pollution from animal feeding operations. I would like to thank this Committee for its support and funding for the Clean Water Action Plan, almost all of which goes to the states.

Today, because of the Clean Water State Revolving Fund and Construction Grants programs supported by this Committee, more than 176 million Americans receive the benefit of at least secondary treatment of wastewater, keeping pollution out of our rivers, lakes and coastlines.

We are making significant progress cleaning up toxic waste sites. As of the end of 1998, 585 Superfund toxic waste sites have been cleaned up. An additional 85 construction completions will occur in 1999. In addition, 227 communities have benefitted from more than \$44 million in grants to revitalize Brownfields. The Brownfields program has helped to leverage over \$1 billion in private investments which have gone a long way toward revitalizing communities.

Approximately 164 million Americans are breathing cleaner air today, because of the Clean Air Act. I would like to thank this Committee for providing funding to carry out this legislation which provides crucial health protections.

Our fiscal year 2000 Budget, in the tradition of every previous budget submitted by this Administration, is based on what the President and Vice President have proved over the past six years—that we don't have to choose between environmental protection and economic growth. A strong economy and a healthy environment and a healthy economy go hand in hand. They are inextricably linked.

Today, we have some of the toughest environmental and public health protections in the world, and our economy is not only strong, it is soaring. In 1992, this nation had a record high \$290 billion deficit. This year, we expect a \$79 billion budget surplus. That's progress.

Building on this record of success, the Clinton-Gore 2000 budget request charts a new course to meet the environmental challenges of the coming century. This budget recognizes that protecting our environment is about more than beautiful vistas and scenic rivers, and it's about more than passing new environmental and public health laws. It's about protecting our health, our air, our water, our land, our food, and our children.

This budget reflects a new American ideal. It's about neighborhoods, protecting where we live and how we live, and what we do in the everyday life. It's about communities—and how we keep them healthy, strong, and prosperous. It's about improving the quality of our lives.

Three new landmark initiatives in this budget reflect President Clinton's and Vice President Gore's commitment to America's communities. These initiatives provide significant new, innovative financial tools to give communities the flexibility they need to address their most pressing environmental and public health needs. They tap into our nation's greatest resources—our ingenuity and spirit of collaboration. They protect our most precious resource first—our children.

The Better America Bonds program puts the Agency in the forefront of support for the President's and Vice President's initiative to build livable American communities. This new, innovative, financial tool is aimed at helping communities address problems associated with urban sprawl—such as, traffic congestion, lost farmland, threatened water quality, shrinking parkland and abandoned industrial sites, or Brownfields. This is about flexibility. Communities can decide for themselves how they will preserve their open spaces, protect their water, revitalize their blighted urban areas, and improve their quality of life. The Administration proposes federal tax credits that will support \$9.5 billion in bond authority over five years for investments by state, local and tribal governments. Through this initiative, the funds invested by local communities to protect the environment could go farther. I urge you to give local communities this flexibility to address their most urgent environmental needs.

The President's budget includes \$200 million for a new Clean Air Partnership Fund—an initiative that is part of the Administration's efforts to clean the nation's air and meet the challenge of global warming. The Clean Air Partnership Fund will promote innovative technology demonstrations to help communities nationwide reduce harmful air pollution and greenhouse gases. The Fund finances, through grants, the creation of partnerships among local communities, states and tribes, the private sector, and the Federal government. There is no requirement to participate. These are simply grants designed to finance projects that are locally managed and self-supporting and that enable communities to achieve their clean air goals sooner. The Fund will stimulate cost-effective pollution control strategies, spur technological innovation, and leverage substantial non-federal investment in improved air quality.

I am very excited to discuss this next issue: children's health. I am aware that this is a concern we both share. Your work on children's issues, as both Governor and Senator, has done much to help ensure that our children are well prepared for a lifetime of achievement. Reducing children's exposure to toxins in our environment, toxins that can exacerbate asthma, is a top priority for the budget before you today and is a central theme in this Administration's fiscal year 2000 budget. I look forward to finding opportunities for you and I to work together on this very important issue. As a start, I'd like to describe the Agency's fiscal year 2000 proposal for fighting childhood asthma.

The Agency will take a leadership role as part of an Administration-wide effort to fight childhood asthma and address this growing problem. Five million children suffer from this debilitating disease. President Clinton has provided an additional \$17 million, for a total of \$22 million, to reduce children's exposure to toxins in our environment that can exacerbate asthma. This funding will implement an inter-agency initiative for education, outreach, and air monitoring. An additional \$12 million, for a total of \$40 million, focuses on other chronic childhood afflictions, such as cancer and developmental disorders. EPA's investment to protect children from environmental threats totals \$62 million.

In addition to these three new initiatives, the President's budget also continues our work on the nation's other environmental and public health priorities.

Last year, the President announced a national blueprint to restore and protect our nation's rivers, lakes, and coastal waters—and we made great progress. The President's budget allocates \$651 million for the Clean Water Action Plan, and related activities, to continue our efforts to restore and protect watersheds across the country.

Because polluted runoff is one of the most serious problems facing communities, the President proposes another important flexible funding mechanism—this one designed to help communities provide clean water. The President's proposal will allow

states greater flexibility to address their most pressing water quality problems: polluted runoff from city streets, suburban lawns and rural areas. The proposal will give states for the first time the option to set aside up to 20 percent (or as much as \$160 million) of their fiscal year 2000 Clean Water State Revolving Fund allotment for grants to implement non-point source pollution and estuary management projects. We will need the authority to allow states to set aside these funds for this state-managed grant program. I look forward to working with Congress to provide this authority so that we can implement this important, new funding mechanism.

In addition, the President's budget provides a combined \$1.625 billion for the state revolving funds (SRF), of which \$800 million funds the Clean Water SRF and \$825 million funds the Drinking Water SRF. The Drinking Water SRF increases from last year, and will help achieve the Administration's goal of capitalizing the Drinking Water SRF until states can provide an average of \$500 million in annual financial assistance for drinking water projects.

The Clean Water SRF request is part of the Administration's overall capitalization plan to ensure states can provide an average of \$2 billion a year in financial assistance for water quality projects. We plan to continue capitalization of the Clean Water SRF until this goal is met. I would like to note that almost \$16 billion in Federal capitalization grants have been provided so far to the Clean Water SRF, or almost 90 percent more than originally authorized.

The President's budget invests approximately \$216 million at EPA, and \$1.8 billion government-wide, to help reduce the pollution that causes global warming. This program will continue the Administration's efforts to address the challenge of climate change through innovative, cost-effective partnerships with businesses, schools, states and local governments that voluntarily lower energy use—and energy bills, for everyone. The Climate Change Technology Initiative proposed by the President this year also offers tax credits for consumers who purchase fuel efficient cars, homes, appliances and other energy-efficient products. It also includes increased spending on research to develop new, cleaner technologies in areas like the Partnership for a New Generation of Vehicles and the Partnership for Advancing Technology in Housing.

The President's budget invests \$1.5 billion in Superfund to continue cleanup of toxic waste sites. The Agency plans to complete clean up construction at 85 sites for a total of 755 construction completions by the end of 2000, with a target of 925 through 2002. The Budget also invests approximately \$92 million in the clean up and redevelopment of abandoned industrial sites through our Brownfields Program, including \$35 million for the Brownfields Revolving Loan Fund which helps communities leverage funds for actual cleanup of Brownfield sites. Through 2000, the Agency will have funded Brownfields site assessment pilots in 350 communities across our great nation.

Of special importance in this budget proposal is our request to increase the Agency's Operating Programs by five percent over the fiscal year 1999 Enacted level. This budget provides \$3.7 billion for the Operating Programs, which include most of the Agency's research, regulatory and enforcement programs and funds our partnership programs with states, tribes, and local governments. The Operating Programs, which have grown 33 percent during this Administration, represent the backbone of the nation's efforts to protect public health and the environment through sound science, standard setting, and enforcement. It is through these programs that the Agency works to ensure that our water is pure, our air is clean and our food is safe. I cannot emphasize enough the important contribution the Operating Programs make to the Agency's ability to meet the expectations of the American public for a safe, healthy environment.

As part of these important Operating Programs, the President requests \$19 million for the Chemical Right-To-Know Program. This includes \$14.4 million for the Chemical Right-to-Know Initiative to focus on accelerating the screening and testing of the 2,800 highest production volume chemicals used in the U.S. We will conduct this initiative through a voluntary industry challenge program and a series of test rules for those data not obtained through the voluntary program. Information on these chemicals, many that we use daily in virtually every aspect of our lives, will be broadly disseminated to the public. The President's budget also provides \$18 million for Environmental Monitoring for Public Access and Community Tracking (EMPACT) to provide citizens with access to real-time information about the health of the air, land and water in their communities.

The President's budget supports sound science with \$681 million for developing and applying the best available science for addressing current and future environmental hazards, as well as new approaches toward improving environmental protection. The Agency will focus its research efforts on areas such as Particulate Matter, Global Change, Mercury and the Coastal Research Initiative.

The Air Toxics program increases by almost \$18 million in new funding, for a total of approximately \$109 million. This program will focus on urban air toxics to develop tools and data that will move the air toxics program from an almost exclusively technology-based program to a risk-based program. The program is geared to reduce risks for poor and minority groups, who are more prevalent in urban areas, and will increase protection to a larger number of more sensitive populations, such as children and the elderly.

The budget request for the Mexican Border is \$100 million, a \$50 million increase, for projects there. The Agency will use these resources for direct grant assistance intended to address the environmental and public health problems associated with untreated industrial and municipal sewage on the border.

These are the highlights of our fiscal year 2000 Request. Mr. Chairman, I appreciate that this Subcommittee balances different priorities which are all important to our nation, and that you do so with the responsibility of stewardship over the taxpayers' dollars. I look forward to discussing with you, as the year progresses, the initiatives and innovative financing mechanisms in our budget request. I believe they embody a common-sense, cost-effective approach to environmental protection. I would be happy to answer your questions at this time.

ENVIRONMENTAL PROTECTION

STATUS OF EPA'S EFFORTS TO CREATE A CENTRAL INFORMATION OFFICE

Mr. Chairman and Members of the Subcommittee: We appreciate the opportunity to present this statement for the record, which discusses our preliminary observations based on our ongoing work for this Subcommittee concerning the Environmental Protection Agency's (EPA) information management initiatives. Specifically, this statement provides information on (1) the status of EPA's efforts to create a central office responsible for information management, policy, and technology issues and (2) the major challenges that the new office needs to address in order to achieve success in collecting, using, and disseminating environmental information. Our final report will be provided in August 1999.

EPA estimates that its central information office will be operational by the end of August 1999 and will have a staff of about 350 employees. The office will address a broad range of information policy and technology issues, such as improving the accuracy of EPA's data, protecting the security of information that EPA disseminates over the Internet, developing better measures to assess environmental conditions, and reducing information collection and reporting burdens. EPA recognizes the importance of developing an information plan showing the goals of the new office and the means by which they will be achieved but has not yet established milestones or target dates for completing such a plan. Although EPA has made progress in determining the organizational structure for the new office, it has not yet finalized decisions on the office's authorities, responsibilities, and budgetary needs. Nor has the agency performed an analysis to determine the types and the skills of employees that will be needed to carry out the office's functions. EPA officials told us that decisions on the office's authorities, responsibilities, budget, and staff will be made before the office is established in August 1999.

On the basis of our prior and ongoing reviews of EPA's information management problems, we believe that the success of the new office depends on the agency's addressing several key challenges as it develops an information plan, budget, and organizational structure for that office. Most importantly, EPA needs to (1) provide the office with the resources and the expertise necessary to solve the complex information management, policy, and technology problems facing the agency; (2) empower the office to overcome organizational challenges to adopting agencywide information policies and procedures; (3) balance the agency's need for data on health, the environment, and program outcomes with the call from the states and regulated industries to reduce their reporting burdens; and (4) work closely with its state partners to design and implement improved information management systems.

BACKGROUND

In October 1998, the EPA Administrator announced plans to create an office with responsibility for information management, policy, and technology. This announcement came after many previous efforts by EPA to improve information management and after a long history of concerns that we, the EPA Inspector General, and others have expressed about the agency's information management activities. Such concerns involve the accuracy and completeness of EPA's environmental data, the fragmentation of the data across many incompatible databases, and the need for improved measures of program outcomes and environmental quality.

The EPA Administrator described the new office as being responsible for improving the quality of information used within EPA and provided to the public and for developing and implementing the goals, standards, and accountability systems needed to bring about these improvements. To this end, the information office would (1) ensure that the quality of data collected and used by EPA is known and appropriate for its intended uses, (2) reduce the burden of the states and regulated industries to collect and report data, (3) fill significant data gaps, and (4) provide the public with integrated information and statistics on issues related to the environment and public health. The office would also have the authority to implement standards and policies for information resources management and be responsible for purchasing and operating information technology and systems.

PROGRESS IS BEING MADE, BUT KEY QUESTIONS ON RESOURCES AND STRATEGIES
REMAIN UNRESOLVED

Under a general framework for the new office that has been approved by the EPA Administrator, EPA officials have been working for the past several months to develop recommendations for organizing existing EPA personnel and resources into the central information office. Nonetheless, EPA has not yet developed an information plan that identifies the office's goals, objectives, and outcomes. Although agency officials acknowledge the importance of developing such a plan, they have not established any milestones for doing so. While EPA has made progress in determining the organizational structure of the office, final decisions have not been made and EPA has not yet identified the employees and the resources that will be needed. Setting up the organizational structure prior to developing an information plan runs the risk that the organization will not contain the resources or structure needed to accomplish its goals.

INFORMATION PLAN IS NEEDED

Although EPA has articulated both a vision as well as key goals for its new information office, it has not yet developed an information plan to show how the agency intends to achieve its vision and goals. Given the many important and complex issues on information management, policy, and technology that face the new office, it will be extremely important for EPA to establish a clear set of priorities and resources needed to accomplish them. Such information is also essential for EPA to develop realistic budgetary estimates for the office.

EPA has indicated that it intends to develop an information plan for the agency that will provide a better mechanism to effectively and efficiently plan its information and technology investments on a multiyear basis. This plan will be coordinated with EPA's agencywide strategic plan, prepared under the Government Performance and Results Act. EPA intends for the plan to reflect the results of its initiative to improve coordination among the agency's major activities relating to information on environment and program outcomes. It has not yet, however, developed any milestones or target dates for initiating or completing either the plan or the coordination initiative.

ORGANIZATIONAL STRUCTURE IS NOT YET DETERMINED

In early December 1998, the EPA Administrator approved a broad framework for the new information office and set a goal of completing the reorganization during the summer of 1999. Under the framework approved by the EPA Administrator, the new office will have three organizational units responsible for (1) information policy and collection, (2) information technology and services, and (3) information analysis and access, respectively. In addition, three smaller units will provide support in areas such as data quality and strategic planning.

A transition team of EPA staff has been tasked with developing recommendations for the new office's mission and priorities as well as its detailed organizational and reporting structure. In developing these recommendations, the transition team has consulted with the states, regulated industries, and other stakeholders to exchange views regarding the vision, goals, priorities, and initial projects for the office.

One of the transition team's key responsibilities is to make recommendations concerning which EPA units should move into the information office and in which of the three major organizational units they should go. To date, the transition team has not finalized its recommendations on these issues or on how the new office will operate and the staff it will need.

NEEDED RESOURCES ARE STILL UNKNOWN

Even though EPA has not yet determined which staff will be moved to the central information office, the transition team's director told us that it is expected that the office will have about 350 employees. She said that the staffing needs of the office will be met by moving existing employees in EPA units affected by the reorganization. The director said that, once the transition team recommends which EPA units will become part of the central office, the agency will determine which staff will be assigned to the office. She added that staffing decisions will be completed by July 1999 and the office will begin functioning sometime in August 1999.

The funding needs of the new office were not specified in EPA's fiscal year 2000 budget request to the Congress because the agency did not have sufficient information on them when the request was submitted in February 1999. The director of the transition team told us that in June 1999 the agency will identify the anticipated resources that will transfer to the new office from various parts of EPA. The agency plans to prepare the fiscal year 2000 operating plan for the office in October 1999, when EPA has a better idea of the resources needed to accomplish the responsibilities that the office will be tasked with during its first year of operation. The transition team's director told us that decisions on budget allocations are particularly difficult to make at the present time due to the sensitive nature of notifying managers of EPA's various components that they may lose funds and staff to the new office.

Furthermore, EPA will soon need to prepare its budget for fiscal year 2001. According to EPA officials, the Office of the Chief Financial Officer will coordinate a planning strategy this spring that will lead to the fiscal year 2001 annual performance plan and proposed budget, which will be submitted to the Office of Management and Budget by September 1999.

EPA'S NEW INFORMATION OFFICE WILL FACE SIGNIFICANT CHALLENGES

The idea of a centralized information office within EPA has been met with enthusiasm in many corners not only by state regulators, but also by representatives of regulated industries, environmental advocacy groups, and others. Although the establishment of this office is seen as an important step in improving how EPA collects, manages, and disseminates information, the office will face many challenges, some of which have thwarted previous efforts by EPA to improve its information management activities. On the basis of our prior and ongoing work, we believe that the agency must address these challenges for the reorganization to significantly improve EPA's information management activities. Among the most important of these challenges are (1) obtaining sufficient resources and expertise to address the complex information management issues facing the agency; (2) overcoming problems associated with EPA's decentralized organizational structure, such as the lack of agencywide information dissemination policies; (3) balancing the demand for more data with calls from the states and regulated industries to reduce reporting burdens; and (4) working effectively with EPA's counterparts in state government.

OBTAINING SUFFICIENT RESOURCES AND EXPERTISE

The new organizational structure will offer EPA an opportunity to better coordinate and prioritize its information initiatives. The EPA Administrator and the senior-level officials charged with creating the new office have expressed their intentions to make fundamental improvements in how the agency uses information to carry out its mission to protect human health and the environment. They likewise recognize that the reorganization will raise a variety of complex information policy and technology issues.

To address the significant challenges facing EPA, the new office will need significant resources and expertise. EPA anticipates that the new office will substantially improve the agency's information management activities, rather than merely centralize existing efforts to address information management issues. Senior EPA officials responsible for creating the new office anticipate that the information office will need "purse strings control" over the agency's resources for information management expenditures in order to implement its policies, data standards, procedures, and other decisions agencywide. For example, one official told us that the new office should be given veto authority over the development or modernization of data systems throughout EPA.

To date, the focus of efforts to create the office has been on what the agency sees as the more pressing task of determining which organizational components and staff members should be transferred into the new office. While such decisions are clearly important, EPA also needs to determine whether its current information manage-

ment resources, including staff expertise, are sufficient to enable the new office to achieve its goals.

OVERCOMING PROBLEMS ASSOCIATED WITH EPA'S DECENTRALIZED ORGANIZATIONAL STRUCTURE

EPA will need to provide the new office with sufficient authority to overcome organizational obstacles to adopt agencywide information policies and procedures. As we reported last September, EPA has not yet developed policies and procedures to govern key aspects of its projects to disseminate information, nor has it developed standards to assess the data's accuracy and mechanisms to determine and correct errors.¹

Because EPA does not have agencywide policies regarding the dissemination of information, program offices have been making their own, sometimes conflicting decisions about the types of information to be released and the extent of explanations needed about how data should be interpreted. Likewise, although the agency has a quality assurance program, there is not yet a common understanding across the agency of what data quality means and how EPA and its state partners can most effectively ensure that the data used for decision-making and/or disseminated to the public is of high quality. To address such issues, EPA plans to create a Quality Board of senior managers within the new office in the summer of 1999.

Although EPA acknowledges its need for agencywide policies governing information collection, management, and dissemination, it continues to operate in a decentralized fashion that heightens the difficulty of developing and implementing agencywide procedures. EPA's offices have been given the responsibility and authority to develop and manage their own data systems for the nearly 30 years since the agency's creation. Given this history, overcoming the potential resistance to centralized policies may be a serious challenge to the new information office.

BALANCING THE NEED TO COLLECT MORE DATA AND EFFORTS TO REDUCE REPORTING BURDENS

EPA and its state partners in implementing environmental programs have collected a wealth of environmental data under various statutory and regulatory authorities. However, important gaps in the data exist. For example, EPA has limited data that are based on (1) the monitoring of environmental conditions and (2) the exposures of humans to toxic pollutants. Furthermore, the human health and ecological effects of many pollutants are not well understood. EPA also needs comprehensive information on environmental conditions and their changes over time to identify problem areas that are emerging or that need additional regulatory action or other attention.

In contrast to the need for more and better data is a call from states and regulated industries to reduce data management and reporting burdens. EPA has recently initiated some efforts in this regard. For example, an EPA/state information management workgroup looking into this issue has proposed an approach to assess environmental information and data reporting requirements based on the value of the information compared to the cost of collecting, managing, and reporting it. EPA has announced that in the coming months, its regional offices and the states will be exploring possibilities for reducing paperwork requirements for EPA's programs, testing specific initiatives in consultation with EPA's program offices, and establishing a clearinghouse of successful initiatives and pilot projects.

However, overall reductions in reporting burdens have proved difficult to achieve. For example, in March 1996, we reported that while EPA was pursuing a paperwork reduction of 20 million hours, its overall paperwork burden was actually increasing because of changes in programs and other factors.² The states and regulated industries have indicated that they will look to EPA's new office to reduce the burden of reporting requirements.

WORKING MORE EFFECTIVELY WITH STATE COUNTERPARTS

Although both EPA and the states have recognized the value in fostering a strong partnership concerning information management, they also recognize that this will be a challenging task both in terms of policy and technical issues. For example, the states vary significantly in terms of the data they need to manage their environmental programs, and such differences have complicated the efforts of EPA and the

¹"Environmental Information: Agencywide Policies and Procedures Are Needed for EPA's Information Dissemination" (GAO/RCED-98-245, Sept. 24, 1998).

²"Environmental Protection: Assessing EPA's Progress in Paperwork Reduction" (GAO/T-RCED-96-107, March 21, 1996).

states to develop common standards to facilitate data sharing. The task is even more challenging given that EPA's various information systems do not use common data standards. For example, an individual facility is not identified by the same code in different systems.

Given that EPA depends on state regulatory agencies to collect much of the data it needs and to help ensure the quality of that data, EPA recognizes the need to work in a close partnership with the states on a wide variety of information management activities, including the creation of its new information office. Some partnerships have already been created. For example, EPA and the states are reviewing reporting burdens to identify areas in which the burden can be reduced or eliminated. Under another EPA initiative, the agency is working with states to create data standards so that environmental information from various EPA and state databases can be more readily shared. Representatives of state environmental agencies and the Environmental Council of the States have expressed their ideas and concerns about the role of EPA's new information office and have frequently reminded EPA that they expect to share with EPA the responsibility for setting that office's goals, priorities, and strategies. According to a Council official, the states have had more input to the development of the new EPA office than they typically have had in other major policy issues and the states view this change as an improvement in their relationship with EPA.

OBSERVATIONS

Collecting and managing the data that EPA requires to manage its programs have been major long-term challenges for the agency. The EPA Administrator's recent decision to create a central information office to make fundamental agencywide improvements in data management activities is a step in the right direction. However, creating such an organization from disparate parts of the agency is a complex process and substantially improving and integrating EPA's information systems will be difficult and likely require several years. To fully achieve EPA's goals will require high priority within the agency, including the long-term appropriate resources and commitment of senior management.

[General Accounting Office, April 29, 1999]

HAZARDOUS WASTE: OBSERVATIONS ON EPA'S CLEANUP PROGRAM AND BUDGET MANAGEMENT PRACTICES

(By Peter F. Guerrero)

Mr. Chairman and Members of the Subcommittee: We are pleased to provide you with information on the Environmental Protection Agency's (EPA) hazardous waste cleanup programs to assist in your deliberations on the agency's budget request for fiscal year 2000. Our work has determined that EPA faces several management challenges in implementing two of its hazardous waste cleanup programs—the Superfund program, under the Comprehensive Environmental Response, Compensation, and Liability Act, commonly known as CERCLA, and the Corrective Action program, under the Resource Conservation and Recovery Act, commonly known as RCRA. For the Superfund program, we found that the agency needs to better control cleanup costs, especially contractors' costs. For the Corrective Action program, we found that four key factors are hampering the progress of cleanups, including companies' reluctance to begin cleanups without an economic incentive and EPA's lack of resources to direct more companies to conduct cleanups. These management challenges demonstrate that the agency could more cost-effectively implement the Superfund program but needs more resources for the Corrective Action program—findings that are relevant to your decisions on the levels of new funding for these programs.

More specifically, you asked us to provide information on three management issues confronting these cleanup programs: (1) the amount of contracts that EPA has awarded to private companies that conduct Superfund cleanup activities for the agency, (2) the extent to which EPA is using its "Contracts 2000" initiative as a vehicle to improve the agency's Superfund contract management practices, and (3) our perspective on the potential effects of transferring \$25 million from the Superfund program's budget to the Corrective Action program's budget as a means of increasing the number of cleanups under RCRA. Our observations are based predominantly on two reports. In October 1997, we reported on the progress of cleanups under the Corrective Action program. Today, we are issuing a report discussing the progress

that EPA and other federal agencies have made in resolving Superfund program management issues.¹

In summary, we observed the following:

EPA may be retaining more contractors than it needs to conduct its Superfund cleanup work. As a result, contractors often have low levels of work and high program support costs, such as those for rent and managers' salaries. Given that EPA expects its future Superfund workload to decrease as states take on more cleanups that the agency would otherwise have managed under Superfund and as cleanup construction is completed at more sites, contractors will continue to incur high program support costs unless EPA makes adjustments in the number of contracts it awards.

EPA could use the team that is managing its Contracts 2000 initiative—an effort designed to help the agency put in place the Superfund cleanup contracts it needs and assess its contract management practices—to address some of the recurring contract management issues we have identified, such as high program support cost rates. However, the agency could not provide us with documentation describing the (1) overall plan that the team would use to determine what options it would recommend that the agency adopt for improving Superfund contract management practices, and (2) time frames for implementing these improvements.

Transferring \$25 million from Superfund to the Corrective Action program could help EPA achieve more RCRA cleanups; however, we cannot determine with certainty what impact this transfer would have on Superfund. When we assessed the progress of cleanups under the Corrective Action program, we found that it was slow, in part because companies responsible for conducting cleanups at their facilities did not begin the cleanups unless they had a business incentive to do so, such as wanting to sell or redevelop the property, or until EPA directed them to do so. At the same time, we found that EPA lacked the resources it needs to direct more companies to begin cleanups. Therefore, providing more funds for corrective actions could increase cleanup activities. In our report on Superfund program management issues, we observed that for fiscal year 1998, EPA had more sites ready to begin the construction of a cleanup method than funds available. Thus, reducing the program's budget could further delay cleanups. Nevertheless, EPA has the flexibility to propose how it will use the funds it receives for Superfund, such as the relative amounts it would like to use for remedial work and enforcement actions. Therefore, EPA might be able to manage a reduction in its budget by cutting its administrative costs rather than performing fewer cleanup activities.

BACKGROUND

When EPA awards a Superfund contract, it specifies that the contractor will obtain up to a certain dollar amount of cleanup work over a given time period. As the contractor conducts the work, it incurs costs—both direct costs that can be attributed to an individual site and indirect costs that are not site specific. EPA pays the contractor for both types of costs. EPA tracks the amount of non-site-specific costs it pays as a percentage, or rate, of the total contract costs that it covers. One subset of these indirect costs is the contractor's program support costs, for items such as rent and managers' salaries. Since the mid-1990s, EPA has used 11 percent as its target for program support costs.

Within the Superfund program, EPA established a long-term contracting strategy to identify and implement needed contract management improvements. An outgrowth of this strategy is EPA's Contracts 2000 initiative. Under this initiative, a team of EPA staff are helping the agency put in place the contracts it will need to manage its future cleanup workload and to assess and update its Superfund contract management practices. One of the issues that the team has identified as needing resolution is the type and number of contracts to use in the program. How EPA resolves this issue could affect the program support cost rate that it pays.

CONTRACTORS' SUPERFUND PROGRAM SUPPORT COSTS ARE STILL HIGH, IN PART, BECAUSE EPA HAS TOO MANY CONTRACTS FOR ITS CLEANUP WORKLOAD

In a 1997 report on contract management issues,² we stated that the percentage of funds EPA was paying contractors for program support costs (e.g., rent and salaries) was high relative to the percentage it was paying for cleanup costs. Specifi-

¹ *Superfund: Progress Made by EPA and Other Federal Agencies to Resolve Program Management Issues* (GAO/RCED-99-111, Apr. 30, 1999) and *Hazardous Waste: Progress Under the Corrective Action Program is Limited, but New Initiatives May Accelerate Cleanups* (GAO/RCED-98-3, Oct. 21, 1997).

² *Superfund Program Management* (GAO/HR-97-14, Feb. 1997).

cally, the program support costs ranged from 21 to 38 percent of the total costs for some of the new Superfund contracts that EPA was awarding as its old contracts expired. These amounts exceeded EPA's target of 11 percent. In August 1998, we further reported that, overall, contractors' program support costs averaged about 29 percent of total contract costs.³ For our report on contract management issues, we reviewed the 15 new Response Action Contracts that EPA had awarded and determined that the program support cost rates for 5 of them were below EPA's target and the rates for 10 of them exceeded EPA's target, ranging from 16 to 76 percent with a median of 28 percent.⁴ According to several EPA contracting officers, the agency expects such high rates for new contracts until it has had time to award enough work to all of the contractors. The officials predict that as EPA awards more work assignments, these program support cost rates should decrease.

However, the uncertain future of the program may make such a decrease difficult to achieve. When EPA began replacing its expiring contracts with new contracts, it had to decide how many contracts to award. In September 1992, it used the number of work assignments under its 45 expiring contracts to project the number of work assignments it would have in the future. Because the agency expected the number of work assignments to remain steady, it believed that if it reduced the number of contracts it awarded, it could give its contractors more work and their program support cost rates would decrease. Initially, EPA decided to reduce the number of contracts from 45 to 22; later, it further reduced the number to 19 because it no longer expects to have the workload it originally predicted. However, EPA may still have more contracts in place than it needs. For example, EPA has been enrolling fewer sites in the program in recent years. In addition, the four EPA regions with the highest Superfund workload indicated that, as the states take on greater cleanup responsibilities, fewer sites will enter the program. With fewer sites, contractors will have less work and EPA will have less chance to reduce its program support cost rates.

EPA will soon have an opportunity to review the number of contracts it should have in place and to try to better control program support costs. EPA designed the current Superfund contracts to last 5 years, with an option to renew them for another 5 years. The 5-year base period will be up for 11 of the current contracts within about 2 years and EPA will have to determine whether to exercise its option to renew them.

RECURRING PROBLEMS RAISE BROADER QUESTIONS ABOUT SUPERFUND CONTRACTING THAT COULD BE ADDRESSED THROUGH EPA'S CONTRACTS 2000 INITIATIVE

While reviewing EPA's progress in resolving Superfund program management issues, including contractors' high program support cost rates, we determined that these problems may be symptoms of more systemic issues associated with EPA's Superfund contracting. EPA could use its Contracts 2000 initiative to address some of the following issues we identified:

Could the agency more quickly and aggressively test and implement alternative types of contracts, such as fixed-price or performance-based contracts, in addition to or instead of using cost-reimbursable contracts as it now does? A cost-reimbursable contract, under which EPA agrees to pay all of a contractor's allowable costs, places most of the financial risk on the government because the work to be performed at a site is uncertain in nature and extent and EPA therefore cannot accurately predict its costs. A fixed-price contract, used for clearly defined and more routine cleanup actions, reduces the financial risk to the government because the parties agree on a price for the contractor's activities and the contractor bears the risk of performing at the agreed price. The Office of Management and Budget has also been urging EPA to make more use of performance-based contracts, which establish a price structure for a contractor's services that rewards the contractor for superior performance, allowing the government to better ensure the receipt of high-quality goods and services at the best price. EPA has begun to use both fixed-price and performance-based contracts on a limited basis at pilot sites.

Is it cost-effective for EPA to duplicate the infrastructure necessary to manage contracts in each of its 10 regional offices as it is now doing?

Are there new and more effective ways to build more competition into EPA's contracting process? Allowing multiple contractors to bid on portions of cleanup work could help to control costs.

³ *Superfund: Analysis of Contractor Cleanup Spending* (GAO/RCED-98-221, Aug. 4, 1998).

⁴ Five of these 15 contracts were less than a year old and two additional ones were just awarded at the time of our review. EPA plans to eventually award a total of 19 contracts nationwide.

Has EPA lowered its contract management costs through its recent use of the U. S. Army Corps of Engineers to manage a portion of its cleanup work? Because the Corps specializes in and conducts a significant amount of construction contracting for the federal government, it may be better equipped than EPA to manage Superfund construction contracts. If using the Corps has been cost efficient for EPA, should it give the Corps additional cleanup work to manage?

Our reviews over the years have consistently shown that without the sustained attention of high-level management, EPA has not always succeeded in implementing and sustaining contracting reforms. Because of this history, we were concerned when the agency could not provide documentation describing the (1) overall plan that the Contracts 2000 team would use for determining what options it would recommend that the agency adopt to improve Superfund contracting practices and (2) the time frames for implementing these improvements. As a result, we do not know whether EPA will move quickly enough to put improvements in place before it decides whether to exercise the option to review its Superfund contracts for another 5 years.

WHILE SHIFTING FUNDS COULD ACCELERATE CORRECTIVE ACTION CLEANUPS, THE IMPACT ON SUPERFUND IS UNCERTAIN

Our work has demonstrated that limited resources have delayed the progress of cleanups under the Corrective Action program; therefore, moving more funds into the program from the Superfund program could help accelerate RCRA cleanups. While we are uncertain how such a shift would affect the Superfund program, EPA may have the flexibility to minimize the impact of a reduction in funds on Superfund cleanups.

Lack of Resources Hampers EPA's Ability to Perform Corrective Action Cleanups

In 1997, we assessed the status of EPA's RCRA Corrective Action program. This program was designed for currently operating facilities that must clean up contamination at their sites, whereas the Superfund program was intended to address contamination at abandoned sites. At the time of our review, we found that only about 8 percent of the approximately 3,700 nonfederal facilities nationwide that treat, store, or dispose of hazardous waste—including only about 5 percent of the approximately 1,300 facilities EPA considers to pose the highest risks—had completed cleanup actions under the Corrective Action program, according to EPA's data. About 56 percent of the remaining facilities—including about 35 percent of those posing the highest risks—had yet to begin the formal cleanup process. While some facilities had undertaken cleanup actions outside the program, the extent of such actions is unknown because the actions are not reflected in EPA's program data.

Contributing to this slow rate of progress was that, without a business incentive, companies were reluctant to initiate cleanups until EPA, or a state implementing the program for EPA, directed them to do so. According to several cleanup managers we spoke with, companies will generally ensure that the contamination at their facilities does not pose an immediate danger to public health or the environment, whether or not EPA or a state has directed the facility to enter the Corrective Action program. However, the companies in our survey appeared to undertake more comprehensive cleanup actions only when they had an economic incentive to do so because the corrective action process can be costly and time-consuming. According to one cleanup manager at a large corporation, the company may not be anxious to pursue a cleanup if the contamination is not posing an immediate threat, the facility is not losing revenue, or the company is not incurring a financial liability by delaying the cleanup.

Although EPA is aware that cleanups are progressing slowly, we found that the agency could not direct more facilities to begin cleanups because it lacked the necessary resources. In fiscal year 1997, EPA expected to direct cleanups at less than 2 percent (46) of the 1,886 facilities—427 of which were high priorities—that had not yet begun cleanup. For example, program managers in one region projected that they would have enough resources that fiscal year to direct companies to begin cleanups at only 4 of their 69 high-priority facilities awaiting cleanup. Likewise, another region had 82 high-priority facilities that were eligible for and awaiting corrective action but expected to be able to enforce such action at only three of the facilities during that fiscal year because of resource constraints. Furthermore, several of EPA's program managers in headquarters and the two regions noted that they may never have the resources to get to the 1,459 lower-priority facilities that were in EPA's corrective action workload at that time. According to EPA Corrective Action program managers, the program's budget did not increase for fiscal years 1998 or 1999. Therefore, the problems we identified in our earlier review remain.

Effect of Moving Funds Out of the Superfund Program Is Difficult to Predict

EPA officials have stated that the agency has serious concerns about transferring funds out of the Superfund program and is evaluating the effect of such a transfer on the agency's Superfund cleanup goals. As we stated in our report on Superfund program management issues, in fiscal year 1998, EPA had 50 sites that were ready to start constructing the cleanup method but funded 38 of them, at a cost of \$200 million, or about 13 percent, of its \$1.5 billion overall Superfund budget.⁵ Given that EPA did not provide funds for all 50 sites, additional cuts to the program's budget could reduce the number of future construction activities the agency could fund.

However, EPA has some flexibility to determine the amount of funds it plans to spend on its various Superfund program activities. Our ongoing work reviewing EPA's total Superfund expenditures demonstrated that for fiscal years 1996 through 1998, EPA spent about 60 percent of its Superfund budget on its own site-specific and contractors' cleanup costs and 40 percent on non-site-specific costs, including its own program management and administrative activities.

Furthermore, we found that over these same 3 years, the amount of funds going to contractors for cleanup work and to other site-specific work was declining. Given that the Superfund program is now almost 20 years old and most sites are in construction and moving toward completion, we would expect to see more spending for cleanups and less for administrative costs. Such a shift in spending would be consistent with changes in the types of work needed and with efficiencies gained through experience. Since such a shift has not yet occurred, EPA may have opportunities to achieve more administrative efficiencies, which it can use instead of cuts in actual cleanup work to offset a reduction in funding for the Superfund program.

Senator BOND. Thank you, Madam Administrator. I will ask that we set the timer at 5 minutes to try and get as many rounds in as possible. I had asked Senator Burns if he would not mind voting early and coming back to—

Senator BURNS. And often?

Senator BOND. Yes, two or three times—and will take the gavel when I leave.

Senator BURNS. Mr. Chairman, might I suggest something here. We have got a little time set aside, floor time to sort of describe and set the stage of where we think agriculture is today, on the floor under the leadership of Senator Coverdell. If you want to go vote, then I will chair, and then when you come back, I will just go over there and vote and stay there.

Senator BOND. All right. Senator Craig, can you—

Senator BURNS. George Frampton has already had a heart attack.

Senator BOND. Senator Craig, can you come back?

Senator CRAIG. I will try to come back.

Senator BOND. Can you vote early and come back? The vote starts at 10:30.

Senator CRAIG. I have some questions for Carol Browner.

Senator BOND. Let me move on and get started.

Senator MIKULSKI. Mr. Chairman, just one note of order. When we vote, I will not be coming back because I am going to a hearing on refugees and the emergency supplemental for Kosovo. I thank the Administrator and I will submit my questions for the record.

GAP ANALYSIS OF WATER QUALITY NEEDS

Senator BOND. All right. Madam Administrator, EPA's 1996 Clean Water Act Needs Survey identified about \$140 billion in waste water infrastructure financing needs. We understand EPA

⁵ In addition to these new construction projects, EPA continued to fund ongoing longer-term construction projects and shorter-term cleanup actions at numerous sites.

has been updating these estimates in what is being called a GAP analysis. What is your revised estimate?

Ms. BROWNER. We will have to submit that for the record. We are concluding that analysis. As you know, Mr. Chairman, in accordance with the desires of both Congress and the States we complete Clean Water and Drinking Water Needs Surveys in alternate years.

Senator BOND. I understand from the various sources like the AMSA and others that it is estimated at about \$200 billion.

Ms. BROWNER. Our analysis is not done yet and we will submit it when it is done.

Senator BOND. We have it. It says—from AMSA—it says that it is—it has been increased to \$200 billion and that does not even include waste water treatment replacement costs.

Ms. BROWNER. Mr. Chairman, I am more than happy to provide it to you. It is not done. We do this by soliciting information from the States. I do not doubt that you are right that the needs continue and that they are significant. We will get it to you the minute we have it done. But we went through a very rigorous program with the States to determine how we would actually do this. And I think it would be inappropriate for me to speak outside of that process.

Senator BOND. Well, we were looking at the public meeting material handed out. I assume this was preliminary information?

Ms. BROWNER. That is correct.

Senator BOND. On Thursday, March 18?

Ms. BROWNER. That would be correct.

Senator BOND. It shows SSO adds—it brings it up to almost \$200 billion and that there are replacement needs as well.

Ms. BROWNER. We do not dispute that there are replacement needs.

Senator BOND. Apparently the SSOs were not included—they were included at \$10 billion the first time around and that is an underestimate. Okay. In view of the significant increased cost, and we think from the preliminary analysis, it would be at least 43 percent, I want to point out that this chart shows the request from OMB, from the President to the EPA. It started out for clean water, \$1.6 billion in 1996; \$1.35 in 1997; \$1.075 in 1998, the same in 1999. This year, \$800 million.

It is dropping off the chart. We believe that the needs are at least \$200 billion plus any addition for replacement, which is also an SRF-eligible number. And given the magnitude of these numbers—and we understand that there are other dollars that go into cleaning up our waste water—why has the presidential recommendation been slashed in half since 1996, when cleaning up the waste water is the one way we can assure that our children and families who go to lakes and beaches and rivers and streams on summer vacation aren't subject to the dangers of water pollution?

Ms. BROWNER. Mr. Chairman, the President made a commitment to provide to the States a fund that would revolve annually at \$2 billion by the year 2005. Because of our work with you, and because of funding levels and a variety of other reasons, the fund will

revolve at the promised \$2 billion, which goes beyond what the Clean Water Act authorizes in the year 2002.

Mr. Chairman, we do not dispute that water pollution continues to be a significant environmental challenge. But when you look at the nature of water pollution across this country, as you yourself know, polluted runoff is as much a problem in many communities as is waste water. What we would suggest to Congress is now is the time for all of us to come together and to rewrite and strengthen the Clean Water Act so we can meet all of the pollution challenges that we face, and to not simply continue to focus on one segment of the problem.

This is a large problem. We agree with you about that. But when you go out there and you talk to the States and you talk to people who deal with water pollution beyond waste water, they are looking at a significant problem. They are looking for support and we would encourage the Congress to work with us.

NONPOINT SOURCE POLLUTION

Senator BOND. Madam Administrator, we have done things on the nonpoint source pollution. We have a number of initiatives going. There are many things that need to be done there. But there is much more than a \$200 billion need. The amount that the President has proposed for revolving funds for the States is, I believe, totally inadequate.

We cannot, no matter what other problems there are, we cannot underfund something that is as important as this. I cannot understand the budget prioritization process when we have such a clear need to address dealing with waste water and the budget is cut. We cannot be setting up new initiatives.

Let me turn now to Senator Mikulski for her questions.

Senator MIKULSKI. Mr. Chairman, in light of the vote and also—

Senator BOND. The good news or bad news, depending on which side you sit on, is that the vote on Kosovo doesn't occur until 11:40. So we will not be interrupted by votes.

Senator MIKULSKI. Senator Byrd, in light—may I just proceed? Otherwise I am happy to defer to you, sir.

Senator BYRD. Proceed.

WASTE WATER: Y2K READINESS

Senator MIKULSKI. Just following up on the waste water issue, Madam Administrator. And I had hoped before your tenure was over that we could call you Madam Secretary, but I understand there were other politics involved. In the Y2K readiness report prepared by Senators Bennett and Dodd and also a GAO survey, there were flashing yellow lights about the Y2K readiness of drinking water plants.

And I will get to my question. As you know, water plants are often automated control systems and, therefore, they are automated and in the event of a Y2K glitch, the failure to have water could have widespread community and public health, et cetera effects. According to GAO, only Colorado and Minnesota have taken actions to assess the readiness of their plants. Twenty-eight States

including Maryland and Virginia are beginning to notify—now this is May.

Could you tell us, number one, your assessment of where we are with Y2K readiness in terms of the availability of water and, number two, what is EPA's role and what action it has taken on this?

Ms. BROWNER. Yes. As I said earlier, EPA, in terms of the systems we managed, have now gotten a clean bill of health. Congressman Horn has given us an "A." Since we have completed the work for our Y2K compliance issues, we are now working with both the States and local governments. And many of these drinking water utilities are privately owned. We are reaching out to States and local governments in terms of the readiness survey and in terms of what actions will need to be taken. It is a mammoth undertaking. We believe, based on what the States have shared with us and the trade associations, that the States are going to be able to address the drinking water systems problems.

Senator MIKULSKI. Are you coordinating this for the nation? Who is coordinating the readiness of these water plants?

Ms. BROWNER. We have worked through the White House office on Y2K compliance. We, in fact, brought this to their attention. We have been conducting outreach meetings with the various stakeholders. The preliminary indications from a survey of 4,000 public water systems, which service about 80 percent of the population, is that 86 percent of these systems that serve 100,000 or more people expect to be Y2K-compliant.

Senator MIKULSKI. Madam Secretary, I want to move on—excuse me, Madam Administrator. In your work with the White House, I think you really need to press them to focus on this issue. We had a briefing from the White House on what they were doing. And it was so general in so many ways. The meeting was helpful, but they really need to feel an urgency on this because we are so used to having good water when we want it that we are complacent.

Ms. BROWNER. We'll provide for the record the various studies that have been done and the analysis we have done if that would be helpful.

Senator MIKULSKI. I think that would.

[The information follows:]

READINESS OF DRINKING WATER PLANTS FOR Y2K

The Agency agrees that the Y2K readiness of drinking water and wastewater utilities is of vital national significance. EPA's Office of Water has been actively leading the outreach efforts to this sector, with substantial assistance and participation by the drinking water and wastewater related trade and professional associations, both national and local/regional chapters. OW and the EPA regional offices have held numerous meetings with trade associations, other stakeholders and state agencies. We have disseminated information through our web sites, developed written materials, and participated in trade conferences and other forums. We have also highlighted this issue through site visits by the EPA Assistant Administrator for Water; these visits were publicized in major drinking water and wastewater trade association journals in a joint effort to raise the level of awareness of this problem. We have worked to have Y2K addressed in drinking water and wastewater operator training sessions in most states.

A recent GAO report indicated that few states have assessed the Y2K readiness of their drinking water and wastewater utilities and that many have not been actively reaching out to inform and work with them. During and since the time of the GAO survey, EPA's regional offices have been working directly with their states and have indicated that state activity has increased on this issue since GAO collected their data.

Many states have sent Y2K information to their drinking water and wastewater utilities; held Y2K seminars, conferences and workshops; published articles; and provided Y2K training to drinking water and wastewater operators. An increasing number of states are conducting Y2K readiness surveys and are incorporating Y2K into site visits. Some states have been very proactive, providing information and assistance, while others have interpreted their regulatory roles and authority as applying only to enforcement activity if a utility should violate its wastewater permit or be out of compliance with drinking water regulations.

The surveys completed last year of wastewater utilities (conducted by the American Metropolitan Sewerage Association) and drinking water utilities (conducted by the American Water Works Association, the Association of Metropolitan Water Agencies and the National Association of Water Companies) indicated that most of the larger systems were taking steps to address the issue and were likely to be prepared. The surveys provided by the associations are attached.

These associations have committed to conducting follow-up surveys with results available by early July. In addition, EPA's Office of Water has agreed to work with the National Rural Water Association (NRWA) to design a survey that NRWA will conduct of the small to medium drinking water and wastewater systems nationwide. These systems were largely unrepresented in the earlier surveys. John Koskinen, Chair of the President's Council on Year 2000 Conversion, requested that the survey results be available by early July to provide a more complete picture of the readiness status of the nations' drinking water and wastewater sector.

EPA continues to work with states, associations and other stakeholders to encourage readiness activities, testing, contingency planning and communication to the public on the Y2K readiness of drinking water and wastewater utilities.

COMMUNITY PUBLIC WATER SYSTEMS YEAR 2000 PREPAREDNESS SURVEY SUMMARY

Introduction

In July and August 1998, the American Water Works Association (AWWA), the Association of Metropolitan Water Agencies (AMWA), and the National Association of Water Companies (NAWC) conducted a joint survey of their member public water utilities to determine the Year 2000 preparedness of community public water systems to address potential computer problems caused by the change of date at the beginning of the year 2000.

The public water utility membership of AWWA, AMWA and NAWC consists of approximately 4,000 public water systems serving approximately eighty percent of the American public. The remainder of the Nation's 55,000 community public water systems which are not members of AWWA, AMWA or NAWC are primarily small rural public water systems which are members of the National Rural Water Association (NRWA) or not members of any of the four major public water system associations.

The 55,000 community public water systems serve a total population of 249 million people. However, the 3,687 community public water systems serving a population of 10,000 or more serve a total of 204 million people. Nearly all of these 3,687 community public water systems are members of AWWA, AMWA, or NAWC. The remaining community public water systems serve a total population of 45 million people. The remainder of the United States population obtain their drinking water from private wells.

Approximately 725 public water systems have responded to the survey. The responding public water systems range in size from small systems serving less than 10,000 people to systems serving more than a million. While the number of respondents is a comparatively small sample of the total population of community public water systems, the preliminary data can be used to provide an indication and understanding of the state of preparedness of the Nation's community public water systems. However, it is also important to note that the state of preparedness of non-responding utilities is not known. This could introduce a bias into the results of a large number of non-responding utilities are also unprepared. These caveats should be kept in mind when evaluating the data of the survey to date.

Tentative Indications

Although a statistically valid projection may not be made from the survey data, the data provide the following tentative indications concerning the state or Year 2000 preparedness of the Nation's community public water systems.

Approximately 75 percent of the American people are served by large community public water systems serving a population over 100,000 people. Based on the survey, community public water systems serving populations of 1,000,000 or more can be expected to have little or minimal internal problems caused by the change of date at the beginning of the year 2000. There are 30 community public water systems

which serve a population of more than 1,000,000. 89 percent of the community public water systems serving a population of 100,000–1,000,000 expect to have Year 2000 compliance work done in time. These statistics seem to indicate that the overwhelming majority of the American people will not have their drinking water supply disrupted or made unsafe by internal Year 2000 computer problems of a community public water system.

However, a smaller percentage of community public water systems (26 percent), including very large systems, appear to have fully assessed the Year 2000 compliance status of service providers and vendors which could affect public water system operations or expect to have completed an external Year 2000 problem assessment before the Year 2000. This raises the possibility that some community public water systems could be affected by power outages, communications failures including data transmission, or a shortage of water treatment chemicals if their external service providers and vendors have Year 2000 problems.

The survey responses concerning contingency plans may cause some confusion. Most public water systems have contingency plans for natural disasters, etc., to operate and provide safe drinking water. This would include using manual operations instead of computer operations and, in a worst case scenario, issuing a “boil water” notice. It would seem that existing public water system contingency plans could be used or adapted for a system failure caused by a Year 2000 problem. It may be that public water systems that indicated that they have not completed contingency plans (83 percent) intend to modify their existing contingency plans to specifically mention the Year 2000 problem and have not completed the update. However, regardless, the majority of the public water systems indicated that they expect to have Year 2000 readiness work done in time.

As one would expect, the survey data indicates that the cost of Year 2000 compliance increases with system size. No estimated total national projection of cost of Year 2000 compliance can be determined from the survey data at this time until a more refined cost analysis is done in conjunction with the total number of public water systems in each size category.

DATA SUMMARY

Formal Plan for Year 2000 Problem

61 percent of the utilities had formal plans for addressing the Year 2000 problem; 36 percent did not have a formal plan; 3 percent did not respond to this question.

52 percent of the systems serving less than 10,000 persons had formal plans; 68 percent of systems serving 10,001–100,000 had formal plans; 89 percent of systems serving 100,001–1,000,000 had formal plans; 100 percent of systems serving over 1,000,000 had formal plans.

Completed Internal Utility-Wide Year 2000 Problem Assessment

51 percent of the utilities have completed an internal utility-wide Year 2000 problem assessment; 42 percent have not completed a utility-wide Year 2000 problem assessment; 7 percent did not respond to this question.

44 percent of utilities serving less than 10,000 persons have completed a utility-wide Year 2000 problem assessment; 57 percent of systems serving 10,001–100,000 have completed a utility-wide Year 2000 problem assessment; 63 percent of systems serving 100,001–1,000,000 have completed a utility-wide Year 2000 problem assessment; 100 percent of systems serving over 1,000,000 have completed a utility-wide Year 2000 problem assessment.

Expect Internal Year 2000 Work to be Completed in Time

81 percent of the utilities expect to complete internal Year 2000 work in time; 13 percent did not expect to complete internal Year 2000 work in time; 6 percent did not respond to this question.

76 percent of the utilities serving less than 10,000 persons expect to have internal Year 2000 work to be completed in time; 87 percent of the utilities serving 10,001–100,000 expect to have internal Year 2000 work to be completed in time; 89 percent of the utilities serving 100,001–1,000,000 expect to have internal Year 2000 work to be completed in time; 100 percent of the utilities serving over 1,000,000 expect to have internal Year 2000 work to be completed in time.

Completed External Year 2000 Problem Assessment

26 percent of the utilities have completed an external Year 2000 problem assessment; 69 percent have not completed an external Year 2000 problem assessment; 5 percent did not respond to this question.

22 percent of utilities serving less than 10,000 persons have completed an external Year 2000 problem assessment; 31 percent of systems serving 10,001–100,000 have

completed an external Year 2000 problem assessment; 35 percent of systems serving 100,001–1,000,000 have completed an external Year 2000 problem assessment; 30 percent of systems serving over 1,000,000 have completed an external Year 2000 problem assessment.

Expect External Year 2000 Work to be Completed in Time

65 percent of the utilities expect to complete external Year 2000 work in time; 29 percent did not expect to complete external Year 2000 work in time; 6 percent did not respond to this question.

62 percent of the utilities serving less than 10,000 persons expect to have external Year 2000 work to be completed in time; 67 percent of the utilities serving 10,001–100,000 expect to have external Year 2000 work to be completed in time; 67 percent of the utilities serving 100,001–1,000,000 expect to have external Year 2000 work to be completed in time; 90 percent of the utilities serving over 1,000,000 expect to have external Year 2000 work to be completed in time.

Completed Contingency Plans for Unforeseen Internal Problems

23 percent of the utilities have completed contingency plans for unforeseen internal problems; 72 percent of the utilities have not completed contingency plans for unforeseen internal problems; 5 percent did not respond to this question.

20 percent of the utilities serving less than 10,000 persons have completed contingency plans for unforeseen internal problems; 25 percent of the utilities serving 10,001–100,000 have completed contingency plans for unforeseen internal problems; 23 percent of the utilities serving 100,001–1,000,000 have completed contingency plans for unforeseen internal problems; 30 percent of the utilities serving over 1,000,000 have completed contingency plans for unforeseen internal problems.

Completed Contingency plans for Unforeseen External Problems

12 percent of the utilities have completed contingency plans for unforeseen external problems; 83 percent of the utilities have not completed contingency plans for unforeseen external problems; 5 percent did not respond to this question.

13 percent of the utilities serving less than 10,000 persons have completed contingency plans for unforeseen external problems; 10 percent of the utilities serving 10,001–100,000 have completed contingency plans for unforeseen external problems; 15 percent of the utilities serving 100,001–1,000,000 have completed contingency plans for unforeseen external problems; 30 percent of the utilities serving over 1,000,000 have completed contingency plans for unforeseen external problems.

Cost of Year 2000 compliance

39 percent of the utilities expect to spend less than \$10,000 to become Year 2000 compliant; 26 percent of the utilities expect to spend \$10,000–\$50,000 to become Year 2000 compliant; 8 percent of the utilities expect to spend \$50,000–\$100,000 to become Year 2000 compliant; 10 percent of the utilities expect to spend \$100,000–\$1,000,000 to become Year 2000 compliant; 4 percent of the utilities expect to spend over \$1,000,000 to become Year 2000 compliant.

As would be expected, the smaller community public water systems expect to spend less and the larger systems expect to spend more on Year 2000 compliance. The survey data range from 56 percent of systems serving less than 10,000 people expecting to spend less than \$10,000 on Y2k compliance to 60 percent of systems serving more than 1,000,000 people expecting to spend more than \$1,000,000 on Year 2000 compliance.

AMSA YEAR 2000 SURVEY ANALYSIS

AMSA Year 2000 Survey—Background

The Association of Metropolitan Sewerage Agencies (AMSA) is a dynamic coalition of over 200 of the nation's publicly-owned wastewater treatment agencies. AMSA members collectively serve the majority of the sewered population in the United States, and treat and reclaim more than 18 billion gallons of wastewater each day. Over the past 28 years, AMSA has maintained a close working relationship with both Congress and the U.S. Environmental Protection Agency in the development of environmental legislation and policymaking.

Locally, AMSA member agencies play a major role in their communities, often spearheading watershed management efforts, promoting industrial/household pollution prevention and water conservation, and developing urban stormwater management programs. AMSA members are true environmental practitioners who work daily towards ensuring the safety and quality of our nation's water supply.

AMSA conducted a survey of its members to assess whether wastewater agencies have evaluated the Year 2000 (Y2K) problem, the estimated costs to remedy the

problem, the status of implementing solutions, the impacts of potential system failures, and whether plans are in place should systems fail. Seventy-six of AMSA's 206 agencies responded to the June 10, 1998 survey, and forty-three responded to the October 2, 1998 followup survey.

Computer Use and Level of Automation

Computers, microchips, electronic data logging/analysis, and remote monitoring/control systems are widely used and are critical components in the overall functions of the Nation's public wastewater treatment agencies. These systems contribute to varying levels of automation in the industry. While many of the functions within wastewater agencies can be automated or computerized, such as administrative functions (i.e., billing, payroll, finances, etc.), process control operations, or laboratory functions, all these functions can be performed manually, and a significant portion of the industry is not fully automated.

Respondents to AMSA's recent survey indicated an average level of automation of 54 percent. For example, some agencies use automated billing systems, while treatment plants may operate manually. Other agencies have fully automated administrative operations, process operations, and industrial compliance programs, but may not have automated data processing in their laboratory.

The survey examines the level of implementation of Supervisory Control and Data Acquisition (SCADA) systems within the AMSA membership. SCADA systems can allow operators to remotely collect operational data, and control operations of pump stations or treatment plant processes from a single location. Among the survey respondents, 88 percent currently implement some form of SCADA system currently, and nearly 100 percent of respondents indicated future plans to use SCADA systems. It should be noted that although a wastewater treatment agency may use SCADA in some of its processes, this does not necessarily mean that the entire treatment process is automated. For instance, a SCADA system may be used to monitor and collect data from remote pumping stations, however, the SCADA may not monitor treatment plant processes.

Nearly 100 percent of the agencies responding to the recent AMSA survey indicated that computers were used in process control, laboratory, industrial compliance, billing systems, and for other administrative purposes, such as finances, inventory, and maintenance management. A complete listing of responses on the use of computers/microchips in agency functions includes:

Administrative.—billing, accounts payable, payroll, human resources, purchasing, telephone systems, assessments, procurement, contract management, capital investment programs, general ledger, office automation, pensions

Maintenance.—system and plant maintenance management, inventory

Operations.—process control, embedded programmable logic controls, SCADA, electronic pressure recorders, generators, collection system monitoring, flow monitoring, mobile equipment, meter reading and routing

Laboratory.—laboratory analysis, calibration, reporting

Industrial Waste.—permitting, industrial compliance determinations, sampling

Engineering.—project tracking, geographic information systems, computer-aided drafting (CAD)

Reporting.—NPDES reporting and monitoring

Other.—interactive voice response, internet, energy management, telephones, security, radio, elevators, fire alarms.

Assessment and Action

A vast majority of AMSA survey respondents (90 percent) have developed a plan to assess and address the Year 2000 problem. Many of these assessments are very formal processes which are either initiated under a comprehensive local government assessment or as part of the agency's overall planning processes (it should be noted that 50 percent of the AMSA membership are agencies which operate under the jurisdiction of a local city or county government, while another 50 percent of AMSA members operate as regional districts). A little more than half of the agencies are addressing (or intending to address) the problem in-house, while the remainder are using consultants or a combination of in-house staff and consultants.

Costs

The costs to address the Year 2000 problem vary widely for survey respondents. Forty-five percent of the wastewater agencies which reported estimated costs indicated that the cost to address the Y2K problem was relatively minimal, ranging from 0 to \$100,000, while fifteen percent reported estimated costs in excess of \$1,000,000, with the two highest reported values being \$15,000,000. Most of the agencies reporting expenditures in excess of \$1,000,000 were relatively large systems, however 17 percent of these were agencies serving populations less than

250,000. In general, most agencies reported total estimated costs to fix the Y2K problem between 0 to 2 percent of annual operation costs. Four agencies reported estimated costs to fix the Y2K problem over 10 percent of annual operation costs. The average annual budget for an agency serving one million people is approximately \$125,000,000.

Progress in Implementing Solutions

Implementation of solutions to the Y2K problem varies widely, though most all responding agencies have made some progress. Approximately 95 percent have begun to implement solutions to the Y2K problem, while 26 percent are complete or nearly complete. To address the Y2K problem, many agencies are systematically checking and upgrading systems which are not Y2K compliant. Figure 1 illustrates a timeline of responding AMSA POTW Y2K efforts. As illustrated in the graph, a majority of the agencies, will have completed the awareness, inventory, and assessment phases of Y2K conversion by January 1, 1999. Responding agencies are poised to focus Y2K efforts on repair, testing, contingency planning, and implementation in 1999 and nearly all have plans to be implementing Y2K ready systems by January 1, 2000.

Figure 1

Figure 2, which illustrates the current status of responding agencies in accordance with six defined phases of Y2K remediation, also highlights that Y2K repair, testing, contingency planning, and implementation in will be a major focus of for waste-water agencies in 1999.

Current Status of AMSA POTW Y2K Efforts

Figure 2

Figure 3 illustrates the status of assessment/correction of Y2K problems associated with embedded microchips. Embedded microchips present a special challenge to the Y2K issue as they are pervasive in a range of systems and equipment including: meter readers, programmable logic controllers, security systems, elevators, alarms, etc. Responding agencies are both testing these systems and receiving assurances from vendors that these systems are Y2K compliant. As the graph illustrates, a majority of the responding agencies are still in the assessment phase for each system type, while many are complete with embedded chip assessments, and are currently implementing remediation efforts, especially for mission critical systems such as plant process and remote process operations.

Figure 3

Impacts of Year 2000 Failure

Though most agencies believe they will be Y2K compliant in 1999, AMSA's survey requested that agencies project the resulting impact, should a Y2K failure occur in any critical systems. A breakdown by agency function follows:

Administration.—Computers are used throughout the administrative functions of a wastewater treatment agency. Billing, payroll, human resources, and many other functions depend on accurate computerized record-keeping and reporting. Potential failures in billing systems are the most troublesome to agencies responding to the survey. Should systems fail in the event of a Year 2000 problem, nearly all agencies indicated that delays in billing would result in serious cash flow interruptions. These interruptions in cash flow are unlikely to directly affect operations, as many agencies have cash reserves on hand, or may be able to negotiate with vendors to extend bill due dates, however, such a failure is likely to have major impact on the administrative functions of the agency. Some agencies reported that they have backup contingencies should there be a failure in automated billing.

Process Control.—All responding agencies with automated process controls have the ability to switch to manual operations almost immediately or within hours in the event of a Year 2000 failure. Approximately 15 percent agencies reported potential treatment plant problems and possible compliance issues as a result of switching to manual mode. Potential additional costs would be incurred with the addition of staff or the payment of overtime.

One of the biggest concerns in this situation is that collection system and plant operational data would not be immediately accessible for the operators, and whether this would lead to sewage backups, overflows, or compliance problems. However, most agencies reported that switching to manual mode would pose none or very minor problems as many automated operations run in parallel with "manual" instrumentation and control. For instance, a wastewater treatment plant may use programmable logic controllers (PLCs) within its treatment operations to control valves or pump operations based on flow or pressure readings. In normal operations, the data from these controllers would be relayed to an operator's computer control screen, and the PLCs would automatically activate valves or pumps accordingly. Should one or more PLCs malfunction, an operator would no longer receive data via the computer control screen and would have to "manually" read a flow meters or pressure gauges. The operator also could not rely on the PLCs to automatically acti-

vate appropriate valves or pumps, thus would also have to “manually” adjust these controls.

One potential catastrophic failure issue which was noted and which is beyond the control of the wastewater agency is the occurrence of a major regional electrical power failure. There are a wide-range of capabilities in terms of operating treatment plants in the absence of a electrical power.

During a recent meeting, with the electric power industry trade groups, power industry officials indicated the a “cautious optimism” regarding their industry’s ability to meet the Y2K challenge by January 1, 2000. The groups referenced a recently released report titled, “Preparing the Electric Power Systems of North America for Transition to the Year 2000—A Status Report and Work Plan” which was submitted to the Department of Energy on September 17, 1998 (available at <http://www.nerc.com>). In summing up the report, officials indicated that any power outages that occur due to Y2K issues are likely to be localized and short-term (i.e. hours or days), and that the chance of a widespread power grid failure is basically zero. Localized and short-term power outages will not produce widespread treatment plant disruption as most facilities have the dual power feeds from differing electrical sub-stations as backup, and/or have reserve capacity within the treatment and collection system to store flows until power is restored.

In the extreme case of a regional, long-term electrical power failure, thirty-seven percent of the responding agencies indicated that all treatment plants under their control could operate indefinitely throughout the power outage. Most of these facilities would use diesel, methane, or natural gas powered generators, though fuel availability would clearly be an issue. Some plants could operate generators with methane produced from on-site solids digestion processes. Another twenty-eight percent of the agencies indicated that their plants could operate at partial capacity, or that some, but not all of the plants under their control could operate fully. Remote pumping stations may also be affected by a regional, long-term power failure. While, seventy-percent of responding agencies would be able to operate their remote pumping stations in the case of a long-term electrical power failure using diesel generators, other agencies would have to rely on mobile generators, or in-line and off-line storage capacity to contain any flows that could not be pumped to the treatment plant.

Laboratory.—Should laboratory systems fail, the issue would be whether agency laboratories could adequately and accurately analyze sample results, and report compliance problems adequately to regulatory and public health agencies. Some agencies can operate in manual mode, while others indicated that out-sourcing of lab functions could be implemented.

Industrial Compliance Programs.—Should industrial compliance systems fail, the wastewater treatment agency would not be able to adequately monitor industrial customer compliance, which could result in undetected high strength discharges leading to treatment plant upsets, delays in issuing permits, and noncompliance with federal regulatory pretreatment requirements.

Plan of Action

Nearly 55 percent of the agencies have completed or begun work on a contingency plan should all or a portion of their computer systems fail as a result of the Year 2000. As noted in Figure 1, all respondents plan to address the issue of contingency plans by January 1, 2000. Contingency plans will discuss issues concerning: (1) how manual operation should be initiated in the case of system failures; (2) chemical and fuel supply needs; (3) coordination with other local entities; (4) manpower needs, and; (5) correction of system failures.

Conclusion

Based on the results of the AMSA survey and follow up discussions with wastewater treatment agency staff, it can be concluded that the large segment of wastewater industry represented by AMSA’s membership will respond effectively to the challenges presented by the Year 2000 problem. However, a significant portion of work will need to be completed prior to January 1, 2000. Remediation, testing, implementation, and contingency planning should be high priorities in 1999.

While treatment plants have become more and more automated over the past ten years, many treatment plants still operate fully manually, and even automated plants can be reverted back to manual mode in a matter of a few minutes or hours depending upon the complexity of the system and manpower availability. Some problems are bound to occur, and may involve either or both internal system problems or external factors that are beyond the control of a public wastewater treatment agency, however, careful program management and proper contingency plan-

ning should minimize the impacts of these problems on public health and the environment.

AMSA YEAR 2000 SURVEY—ADDENDUM

CHEMICAL SUPPLY: 85 percent of responding agencies do not anticipate chemical supply problems associated with Y2K. Some agencies indicate that adequate supply is on-hand (e.g., 3 months) should there be a short-term disruption in the chemical supply/delivery chain.

COMMUNICATIONS: 98 percent of responding agencies indicate that pump stations will be able to operate in the event of a telecommunications failure.

MANPOWER: 35 percent of responding agencies indicate additional manpower needs and/or shortages should Y2K problems require manual operations.

POTENTIAL IMPACT OF EMBEDDED CHIP FAILURES

Communication—Minor
 Building Grounds—Minor
 Instruments—Moderate
 Treatment Plant Processes—Moderate to Major
 Remote Process Operations—Moderate

FOOD SAFETY: PESTICIDE RISKS

Senator MIKULSKI. Let me go to another issue and this also goes to children and public health. I note from a Washington Post article that seven groups have quit your food panel and they criticized EPA for being soft on pesticide risks. I found the article disturbing, Madam Administrator, and I would like to give you the opportunity to share with us where we are on food safety, the whole issue around pesticides because pesticides have a direct impact in nonpoint runoff in our water supply. I was troubled. Could I now hear your response to this and how are you dealing with the pesticides problem? And do you have the resources to do it?

Ms. BROWNER. Yes, we do. As I think you are well aware, Senator Mikulski, Congress passed a new modern food safety law working closely in a bipartisan manner with the administration 2 years ago. That law for the first time ever requires us to take a set of actions that we are in the process of taking. In an effort to make sure that we have addressed both the health concerns and the needs of farmers, we did establish an advisory committee. We are extremely disappointed that the environmentalists, as this committee was concluding its work, decided that they would rather simply pull out and make these kind of attacks.

We will comply with the law. We will meet the deadlines but we are going to do it in a way that is responsive to the needs of all, and that requires a thoughtful and an inclusive process and we are on track. The first deadlines come up in August. We are on track to make those deadlines. We tried to encourage the environmentalists to stay at the table so that they could be a part of the final round of process decisions we will make. They thought it was better to issue a press release and walk away. It is a disappointment to us and we will continue to work—

Senator MIKULSKI. I note my time is up. I just want to conclude by just saying that they pulled out because they accused EPA of endless dithering. Now I am also from the school of thought of sound science. We have encountered many issues on premature science, and that has resulted in very prickly debates on air quality and so on. So I think there is a difference between dithering and pursuing a solid course of action using the best science and the

best minds available in the scientific community to advise us before we go off. I am looking for a balance here, a streamlined process based on sound science, and I think you would have bipartisan support.

Senator CRAIG. Would the Senator yield?

Senator MIKULSKI. Yes. My time is up.

Senator BOND. I would say, let me agree with my ranking member, sound science should be driving this. I am deeply disappointed by the efforts which indicate that we are going to have more hysterical anti-science attacks. We banned alar based on hysteria, not on sound science. We bankrupted apple growers, raised the cost of apples and contributed to more health problems by raising the cost of apples than we benefited by banning alar.

You had a—I defer to the Senator from Idaho, Senator Craig.

Senator CRAIG. Very briefly. The Senator from Maryland is absolutely right. And I must say on behalf of EPA, and I do not often-times find areas to praise them in—

Senator BOND. That is why I deferred to you briefly, Senator Craig. I thought this would be a good opportunity. [Laughter.]

Senator MIKULSKI. This is great.

Senator CRAIG. They were approaching it cautiously and responsibly and they were listening to Agriculture and Agriculture was really trying to find the right answers in working with them in demonstrating how all of this works and does not work. And EPA was listening. And I am disappointed that other stakeholders in this would walk out hoping they can gain ground politically by lawsuits and by press releases. It does not work that way. We will ultimately have a nonproductive agriculture and, as the Chairman said, one that does not produce our food quality in the way we would like it. So on this one, EPA gets some kudos. Stay the course.

Ms. BROWNER. Thank you.

Senator BOND. Thank you, Senator. Right now I turn to Senator Byrd.

TRANSPORTATION PARTNERS PROGRAM

Senator BYRD. Mr. Chairman, as I indicated earlier, I am interested in knowing more about the Transportation Partners program. Can anyone, Mrs. Browner, tell us specifically how this funding is being spent?

Ms. BROWNER. The Transportation Partners is an effort to work on a voluntary basis with local, State, public, and private organizations to look at what is right for those communities at their behest in terms of reducing vehicle miles traveled. This is not about highway construction. It is not about telling people how they should live their lives. There are a number of communities and businesses, for example, some of the business partners include Wal-Mart, Kaiser Permanente, and Bank of America who on behalf of their employees, want to look at alternative modes of transportation which work for the business, the employees and ultimately may work to benefit air quality in the communities.

It is not a required program. It is a voluntary partnership. I think we have over 300 partners now, project partners across the country.

Senator BYRD. My question was can anyone tell us specifically how this funding is being spent?

Ms. BROWNER. It is spent through grants. We are more than happy to give you a detailed explanation of each of the grant awards if that would be helpful. There are nine projects and I can give you some examples. But if you would like each one of them, we would be happy to provide that. Would you like some of the examples?

Senator BYRD. I would suggest you have all of those put in the record and then I will select a few, perhaps, that I may wish to visit with you further on.

Ms. BROWNER. Okay.

[The information follows:]

TRANSPORTATION PARTNERS GRANTS

Association for Commuter Transportation.—No Transportation Partners funds.

Bicycle Federation of America.—No Transportation Partners funds.

Business for Social Responsibility Education Fund (BSR).—Transportation Partners is providing support to BSR to work with at least ten member companies to implement commuter and fleet transportation efficiency measures and to measure the greenhouse gas emissions reductions that results.

Center for Clean Air Policy (CCAP).—Fosters dialogue amongst governmental and private policy makers to help promote innovative, market-based policy approaches to develop effective transportation and environmental policies. Transportation Partners supports CCAP's ongoing dialogue to develop more effective strategies to increase ridership for metropolitan transit systems.

International Council for Local Environmental Initiatives (ICLEI).—By supporting ICLEI's Cities for Climate Protection U.S. Sustainable Transportation Program, Transportation Partners is facilitating an expansion of ICLEI's network of local governments and their private sector allies working on strategies to reduce vehicle miles traveled. ICLEI is focusing most heavily on public-private partnerships through EPA's Climate Wise Program corporate partners to reduce commuter travel through incentives such as parking cash out and to improve fleet efficiency. ICLEI is also developing a menu of options for local governments to reduce their transportation emissions, and quantifying the greenhouse gas emissions reductions resulting from its work.

Environmental Defense Fund (EDF).—Transportation Partners is funding EDF to support education and technical assistance for innovative regional transportation policy alternatives. The analysis and technical assistance provided by EDF to Metropolitan Planning Organizations, State Departments of Transportation, local governments and community groups improves the awareness of policy approaches that can both ease traffic congestion and reduce emissions through demand management and more efficient use of existing transportation systems. Such policies include: commuter choice for employee transportation benefits (aka parking cash-out), time-of-day pricing of roads and parking, and single occupant car buy-in options to more effectively use high-occupancy vehicle lanes.

Local Government Commission (LGC).—EPA is supporting LGC's efforts to provide tools and information to local governments to enhance community livability and reduce vehicle miles traveled. LGC focuses on providing assistance with public participation, administering community image surveys, and developing and distributing an array of technical resources to local governments to encourage transit-oriented and infill development and livable downtowns. LGC assembles teams for on-site visits. LGC is measuring the greenhouse gas emissions reductions attributable to its work.

Renew America.—Transportation Partners is supporting Renew America in its mission to identify, recognize, and promote environmental success stories within the U.S. By co-sponsoring Renew America's Way to Go transportation and the environment awards, EPA is demonstrating that success in reducing vehicle miles traveled is achievable. This program disseminates information about award winners, helps pair winners with others interested in implementing similar programs, and works with the media to ensure appropriate public attention to exemplary transportation efficiency achievements.

Surface Transportation Policy Project (STPP).—STPP promotes transportation policy and investments that help conserve energy, protect environmental qual-

ity, strengthen the economy, promote social equity, and make communities more livable. Transportation Partners provides funds to STPP to: support community involvement in the transportation planning process; assist with the planning of the national Railvolution conference; maintain its TransAct web site; provide outreach to automobile insurance companies to encourage them to price insurance by the mile; and, to document the greenhouse gas reductions of its work with Transportation Partners.

Railvolution.—EPA is supporting this quintessential national conference on enhancing community livability and reduced vehicle miles traveled through the provision of transportation alternatives and supportive community designs. Approximately 1,000 public and private sector leaders throughout the nation are anticipated to gather in Dallas in September 1999 for this important conference.

Senator BYRD. So what are you saying to me when I say can anyone tell us specifically how this funding is being spent?

Ms. BROWNER. Yes.

Senator BYRD. You are saying the answer is yes?

Ms. BROWNER. Absolutely. As I said, I can provide examples today and we can provide the rest. One, for example, is in Howard County, Maryland, that I would be happy to talk about.

Senator BYRD. I would be happy to talk about some that may be in West Virginia.

Ms. BROWNER. Okay.

Senator BYRD. I understand that to become a partner a group must make an application to the agency. What kind of scrutiny does the EPA undertake to select its so-called partners?

Ms. BROWNER. You are correct. They do make an application for a grant award. They come through the traditional grant application process and they are required to comply with all the grant application processes.

TRANSPORTATION PARTNERS: GRANT AWARDS

Senator BYRD. But the question is what kind of scrutiny does the EPA undertake to select its so-called partners?

Ms. BROWNER. They have to have an organization that is capable of doing the work that they are suggesting or are asking to do. They must have the ability to manage the resources that would be provided to them.

If you are concerned that some organization made an application and perhaps was not as forthcoming in terms of their qualifications or their financial management, we would appreciate having that brought to our attention immediately. We will fully investigate the matter. The organizations are required to meet certain requirements.

Senator BYRD. Does anyone at the agency conduct any reviews of these groups?

Ms. BROWNER. Yes. The grant officers are required to ascertain whether or not the groups are capable of the work that they are committing to do.

Senator BYRD. Can the EPA provide this subcommittee with information as to how many of the partners are involved in litigation against highway construction?

Ms. BROWNER. Yes. In fact, we have just recently provided to another committee information on all grant recipients and their litigation records against the agency. I believe that probably the group you are interested in would be a part of that submission. So we

would be happy to provide it. We have provided it to the EPW Committee.

Senator BYRD. Mr. Chairman, I would like to ask that the EPA provide this Committee with information of how many of the partners are involved in litigation against highway construction and what that litigation is about. What the cases are, by number. What the status is of the litigation.

Senator BOND. That will be a request of the committee and it will be made available to all members of the committee.

Ms. BROWNER. We should be able to make that available this week. We have also provided it to the EPW.

Senator Byrd, if I might, I think we may be familiar with—someone here may be familiar with the particular organization you may be concerned with in West Virginia. Just so we give you all of the information, the litigation may be against other Federal agencies that you are concerned about, or against perhaps State agencies. So we will do our best to also determine that. That is not what we were asked to do in the other committee. That may be what you are interested in, in part.

[The information follows:]

GRANT RECIPIENTS AND THEIR LITIGATION RECORDS AGAINST THE AGENCY

Attached are the two charts concerning litigation by EPA grant recipients that EPA submitted to the Senate Environment and Public Works Committee.

Non-Governmental Individuals and Organizations That Received EPA Grants From January 1, 1989-March 31, 1999 and also Sued EPA During That Period

EPA has entered into cooperative agreements with groups that have expertise in various aspects of the transportation and environmental issues. In some cases, groups which have received Federal funds are also engaged in litigation with the Federal government. EPA has strict guidelines that prevent groups from using EPA funds to pay for these legal actions. Every EPA grant agreement is conditioned on compliance with OMB Circulars that prohibit the use of grant funds for suits against the Government. Specifically, they prohibit "costs of legal, accounting, and consultant services, and related costs, incurred in connection with * * * the prosecution of claims or appeals against the Federal Government" (OMB Circular No. A-122, Attachment B, Section 10.g, which applies to nonprofit organizations; same provision in Circular No. A-21, Section J.11.g, which applies to educational institutions) and "legal expenses for prosecution of claims against the Federal Government" (Circular No. A-87, Attachment B, Section 14.b, which applies to State, local, and tribal governments). In addition, EPA's appropriation acts provide that grant funds may not be used to pay the expenses of, or otherwise compensate, non-Federal parties intervening in regulatory or adjudicatory proceedings.

EPA's Transportation Partners (TP) Program is a voluntary program that promotes and supports innovative, local, voluntary efforts to reduce vehicle miles traveled (VMT). The TP program is comprised of a team of national, non-governmental organizations, called Principal Partners, that receive EPA funding to foster innovative transportation solutions nationwide. Transportation Partners has funded nine Principal Partners organizations since 1995.

Funds received by the Principal Partners are used to assist over 350 Project Partners, which include State and local government officials, businesses, communities, and organizations that are engaged in VMT reduction strategies. Project Partners receive no funds from EPA's Transportation Partners Program, nor do they receive any funds or technical assistance from the Principle Partners for litigation.

We are aware of one lawsuit brought by a Principle Partner that is related to highway projects:

Environmental Defense Fund, Inc. v. Environmental Protection Agency, 167 F.3d 641 (D.C. Cir. 1999). This case does not involve a challenge to a particular highway project but to EPA's national conformity rules under the Clean Air Act. (These rules implement the Act's prohibition on metropolitan transportation projects unless they are part of a regional transportation plan that conforms to applicable state air quality standards.) EDF brought the suit to require states to conduct a more extensive and timely analysis of a plan's conformity with air quality standards than was required by EPA's rules. In a decision issued on March 2, 1999, the court held that various parts of EPA's conformity regulations were inconsistent with requirements of the Act.

We are also aware of three lawsuits that appear to have been brought by Project Partners¹ and that are related to highway projects:

Corridor H Alternatives, Inc. v. Slater, 982 F.Supp. 24 (D.D.C.), aff'd in part and rev'd in part, 166 F.3d 368 (D.C. Cir. 1999). This is a case alleging that the U.S. Department of Transportation (DOT) violated the Department of Transportation Act, DOT's regulations, and the National Environmental Policy Act in approving the Corridor H highway project. In an opinion issued on February 9, 1999, the D.C. Circuit halted further construction of Corridor H pending DOT's evaluation of historic sites along the corridor.

Georgians for Transportation Alternatives and Sierra Club v. Shakelford, No. 99-CV-0160. This is a case against DOT (not EPA) relating to numerous grand fathered projects in Atlanta. The case is pending.

Conservation Law Foundation v. Federal Highway Administration, 827 F.Supp. 871 (D. R.I.), aff'd 24 F.3d 1465 (1st Cir. 1994). This is a suit against DOT (not EPA) to stop the Jamestown Connector highway project. The district court denied the plaintiffs' motion for a preliminary injunction against the project; this decision was upheld on appeal.

We are also aware that the Sierra Club and the Conservation Law Foundation have filed three lawsuits related to highway construction in Massachusetts, Connecticut, and Missouri. Although these groups' national offices are not Principle or Project Partners, a number of their local chapters are Project Partners. However, in the states affected by the three lawsuits we are aware of, the local chapters of Sierra Club or the Conservation Law Foundation are not Project Partners. In addition, two of these cases were filed in the early 1990's, long before EPA started its Transportation Partners program.

¹ Conservation Law Foundation of Rhode Island is a Project Partner. We do not know, however, whether this is the chapter of Conservation Law Foundation that instituted this lawsuit.

Lawsuits concerning highway construction are generally brought against the U.S. Department of Transportation (DOT) and/or State or local agencies, not EPA. Because EPA is not a party, we generally do not know about the cases unless they involve the interpretation of EPA's statutes or regulations, and the Department of Justice asks us to review the Government's brief. The Department of Justice or DOT would likely have more complete information than EPA on these lawsuits.

Senator BYRD. Let me state again, Mr. Chairman, what I stated earlier out of order. The EPA program known as Transportation Partners has recently come to my attention through some published reports that make some rather disconcerting charges. Primary among those charges are that this program is the source of funding for some purely anti-road initiatives.

I can certainly see the merit in a program that helps local communities to develop voluntary strategies for transportation-related emissions reduction and that assist them in developing transportation alternatives that reduce traffic volume and congestion. It seems to me that if EPA is actually helping to underwrite activities designed to block construction of authorized and desired safe and more modern highways, a critical name is being built and I would like to know if EPA is doing that. I have no doubt that the public would be dismayed to hear it if, in fact—these are the only reports that I have had—one Federal agency was spending millions of taxpayer dollars to build modern infrastructure and another agency was spending additional taxpayer money to help prevent such construction.

The logical result of this kind of mess is that the taxpayers end up paying several times over, including footing the bill to fight court battles to defend the projects and covering the costs of inflation resulting from lengthy construction delays. The only beneficiaries from this kind of scheme, it would seem, are the lawyers. This scenario simply defies fiscal logic.

I am not saying that these reports are true but that is what we need to find out. And I thank the Chairman and I thank you the Administrator.

Ms. BROWNER. Mr. Chairman, may I just respond very quickly. Senator BOND. Please.

Ms. BROWNER. Senator Byrd, I am also familiar with a report. The one I am familiar with was the Washington Times that raised this question. When it was brought to my attention, I did ask the people in the Agency questions about it. I do not know if that is the report that you saw.

What I do want this committee to know is that there are Federal rules prohibiting grant moneys from being used in litigation, and we abide by all of those rules. We are sued by everybody from environmental groups to Fortune 500 companies. The Home Builders sue us and they receive grants from us. If any of these organizations were to use their grant monies to litigate against us, that would be inappropriate and we would take action and we do monitor for that.

I appreciate the fact that there have been these news reports. It does raise questions and we are more than happy to answer them.

Senator BYRD. Mr. Chairman, I thank the Administrator for making that statement.

Senator BOND. That was the question I was going to ask. Madam Administrator, I would only note that money is fungible. That is

one of the problems we will get into when I come back to ask questions.

We will ask you about the EPA Region 1 Regional Administrator's statement about the agency's, "unwavering commitment to use the full force of environmental law to oppose or seek modification of those transportation projects which by their very nature contribute to sprawl." We will give you an opportunity to respond to that.

Ms. BROWNER. I did not make the statement. I want to be very clear.

Senator BOND. That is the administrator in Region 1. He got our attention.

Senator Burns.

NONPOINT SOURCE POLLUTION

Senator BURNS. Do you know what we are supposed to be doing? Senator Byrd, you raise a very interesting point and I am very interested in what the Administrator said. We could expand this way beyond the Transportation Partnership because we have been trying to deal with this situation in other areas.

Ms. Browner, thank you for coming this morning. And I wanted to talk to you a little bit about what we find ourselves in, as far as an issue that you brought up yourself this morning and that is nonpoint source pollution in the clean water and what we feel is sort of—we are worried about livestock operations.

Let me preface this by saying, clean water is not a luxury. It is essential. We not only think—I know we think principally here in this 17 square miles of logic-free environment that it is for people alone. It is not. It is essential for any kind of production of livestock. I would say that we probably take as much pains and procedures to make sure that we have clean water. So that becomes very important to us.

As you know we, in this country, especially in the agriculture production, there is no commodity making any money now, not one commodity being produced on the farm is making any money. The oil patch is dead; timber, precious metals. The spread between the raw product and the end product is greater now than it has ever been. And yet we proceed under a trade act that opens our markets to those commodities that are not produced under the same rules and regulations that we find ourselves trying to operate under. We cannot compete. We have eaten our seed corn. We are now into the equity of—losing equity very, very quickly.

It is not that we do not want to comply. But we cannot comply. The money is not there. We cannot redo a feeding operation. We just do not have the money. In fact, we are closing them up, in my country anyway. And it is market conditions.

It is hard to talk to my constituents when you have about 250 loads of live cattle a day coming from Canada. Whenever we look at the profitability of banks, improved grocery stores that pack every single item of the food chain, their profitability has improved. Yet we see hardly any increase in food prices, but a drastic decrease in farm funds. It is not the fact that we do not want to cooperate in giving out the money.

I would ask that in your thinking, whenever we start going out and trying to enforce some of these situations that we have, that you take into consideration the situation that we find ourselves in.

Where in the world did I put my questions? I had a whole bunch. That will teach him to give me the gavel. We will have to just adjourn and go home.

You might want to respond to that statement.

Ms. BROWNER. I recognize and the administration certainly recognizes the plight of the farmer in the country today. I know you have worked closely with my colleague Dan Glickman and others to provide very, very much needed support. One suggestion I would make to you——

Senator BURNS. Ms. Browner, that does not do us a damn bit of good.

Ms. BROWNER. I think the problem is quite large.

Senator BURNS. It is market. Ain't nothing wrong on the farm except the product. What they do down there, they might as well go out and go to the golf course with the rest of them. And I am serious about that. I am dead serious. I do not know how we confront that. But go ahead. I'm sorry. I get very emotional about this because they are my people.

Ms. BROWNER. I would not want to suggest that this is the answer. However, I think there may be some opportunity in addressing the environmental concerns of farmers through the funding flexibility that we are asking Congress to provide each State. The flexibility would allow the States to set aside 20 percent of the money for direct grants to communities and combine that with some of the other resources you have been willing to provide.

I do not want to suggest this solves the problem but for a State like Montana, for example polluted runoff, I think that some of the flexibilities and the funding flexibilities we are asking you to provide could be helpful.

BUDGET PRIORITIES FOR FISCAL YEAR 2000

Senator BURNS. We want to work with you and we want to take this thing head on if we possibly can. Keeping in mind that the funds that an individual has are very much limited right now. And it is not that they do not want to. And it is not that they have not done a pretty good job up to this point. Now there are changing conditions out there that would sort of hold some of this up, but nonetheless we know that it is just not there.

Give me some kind of an idea, like, you had a \$383 million reduction for the existing programs in the 2000 budget. If you wanted to come before this committee, what are your primary priorities? What do you see where you will be placing your emphasis in this budget as we move forward into next year?

Ms. BROWNER. Twofold. One is strengthening the protections we provide the American people, air, water——

Senator BURNS. I know. In those areas.

Ms. BROWNER. For example, within the clean water efforts, fully funding the Clean Water Action Plan, \$651 million. Within drinking water, fully funding the request. And I would like to note that there was a statement made earlier that we had cut our drinking water request. We have not. We did not carry forward a congres-

sional earmark. In fact, we have increased funding for that program, not a large amount. But there is no cut to that program.

So within our air pollution efforts, to continue the partnership with the states in terms of the funding we provide to them and the technology.

The second large area of focus will be to give both States and local communities greater abilities to access resources for those things they want to do. For example, the Clean Air Partnership Fund, the President's Better America Bonds Program, really provide tools and resources for those communities who want to take a certain approach to addressing environmental issues. No one is required to participate.

The third area, as important as the others, is ensuring that we have the kind of science, the kind of data analysis, data management that are important to providing both the American people with information but also to the decisions that we, the states and industry, all make in terms of continuing our efforts to reduce pollution challenges.

FOOD QUALITY AND SAFETY

Senator BURNS. You are moving into an area of regulating health care. You are moving into an area where I do not think you are needed, most of it in food quality and safety. I think the USDA has done a pretty good job up to this point.

Ms. BROWNER. USDA has never regulated pesticides. We have done that for 28 years.

Senator BURNS. I know. Now, when we had a meeting, I met with members of Parliament in Canada just this last week in Great Falls. As you know, we have got to standardize one way or the other our regulatory regime between Canada and the United States because Canada continues to have, it seems like, access to pesticides and herbicides and fungicides that we do not down here in the production of some of our crops. Have you had made any efforts to work with Canada to harmonize those standards?

Ms. BROWNER. Yes. In fact, we have a significant effort underway with Canada to look at environmental standards broadly. I meet with the Environment Minister, Christine Stewart, regularly and talk to her even more frequently. Canada, as you well know, their government is set up completely differently. Their Federal level has much less authority in terms of setting environmental standards than the individual provinces. Simple difference in terms of how their government is structured, has proven to be one of the challenges and one of the many challenges we face.

Yes. We recognize this issue and we are, in fact, working with Canada on these issues.

Senator BURNS. In other words, the rules and regulations we have to operate under down here. Yet we allow imports to come in and compete with us. They operate under a different rulebook.

Ms. BROWNER. I know you know this. But a food product cannot enter the United States that does not meet our pesticide tolerance requirements. It cannot be in exceedance. If it is a banned pesticide, for example, it cannot be used. The FDA is responsible for the border inspections to ensure compliance.

In terms of technical issues like the residual limits and data review, we do have differences that we are working on.

Senator BURNS. Are you ready over there, Senator?

Senator HARKIN. I am just getting my instructions.

Senator BURNS. I have got a couple of local issues that we can talk about in my office or your office.

Ms. BROWNER. I will come and see you.

REGIONAL HAZE

Senator BURNS. I feel like this is a place—I am concerned a little bit about regional haze. As you know, the commission was established and then what they recommended, that was made up of governors, with the Grand Canyon. And it seems as though after all was said and done nothing was—the recommendations of those people—of that study, not very many of those recommendations were put in place.

I continue to have those kind of concerns, concerns about we have no control on Federal lands as far as our air quality is concerned. I will talk to Mr. Frampton about that in a little bit in those areas. But a couple of areas that I think—this is more of a local thing with Montana.

Ms. BROWNER. We have worked very, very closely with WGA, and with Governor Leavitt who is their representative, on the regional haze rule. We did make changes in accordance with their recommendations and I think WGA issued a public statement of support for the final program which was announced last week.

Senator BURNS. On what they had recommended.

Ms. BROWNER. No. For the final program which we announced last week on Thursday, Earth Day. WGA is supporting that program and the Western Governors are supporting it. We would be happy to show you the changes we made. We have a very, very intense effort with them.

[The information follows:]

**REGIONAL HAZE RULE
SUMMARY**

PROPOSED RULE	FINAL RULE
SCOPE OF THE RULE	
All 50 States and Virgin Islands required to submit initial regional haze SIPs. (35 states and Virgin Islands have class I areas.)	Unchanged. All States are subject to program.
TIMETABLE FOR INITIAL SIP SUBMITTALS	
<p>Within 12 months of promulgation: "planning" SIP, no control strategies.</p> <p>Later: "control strategy SIP"</p> <p>-- 2003 (for areas without PM-2.5 nonattainment)</p> <p>-- At time PM-2.5 nonattainment SIPs are due (2005 or later).</p>	<p>Takes into account TEA-21</p> <p>After PM-2.5 designations, haze SIP due 1 year later for attainment & unclassifiable areas (about 2004-6), and 3 years later for nonattainment areas (about 2004-8)</p> <p>TEA-21 silent on combined SIPs for both attainment and nonattainment areas. Rule includes optional two-step process:</p> <p>-- Regional planning commitment due 1 year after 1st area designated attainment.</p> <p>-- Control strategy due at same time as nonattainment area SIPs due (3 years after last area designated nonattainment, no later than 2008).</p> <p>-- EPA strongly encourages regional planning. Effort should be led by States, but EPA is committed to active participation and early identification of issues to States.</p>

PROPOSED RULE	FINAL RULE
REASONABLE PROGRESS GOALS	
<p>State sets targets for best and worst visibility days in each Class I area.</p> <p>-- Presumptive target of 1 deciview improvement every 10 (or 15) years for the 20% worst days, no degradation for best days</p> <p>State could set alternate target based on analysis of statutory factors.</p> <p>Baseline conditions: minimum of 3 years, maximum of 9 years.</p>	<p>No presumptive target -- State flexibility to set reasonable progress goal based upon the statutory factors.</p> <p>State required to analyze one specific option-- the rate of improvement for period of the next long-term strategy which would reach natural conditions in 60 years (by 2064).</p> <p>If the State believes that the 60 year rate of improvement is not reasonable, then the State must provide a demonstration and appropriate documentation showing why it is not reasonable.</p> <p>- State must provide demonstration showing why any goal selected is reasonable in light of statutory factors.</p>

<p>Required an identification of potential BART sources in 12-month SIP.</p> <p>Required an evaluation of potential emission reductions and associated visibility improvement from BART sources by 2001 (in order to inform future Long Term Strategy and NAAQS implementation regional options).</p> <p>Required SIPs to address BART requirement - proposal requested comment on this issue broadly.</p>	<p><u>Timing:</u> Address BART at same time as control strategy SIPs (about 2006-2008)</p> <p><u>Scope:</u> BART applies under regional haze program</p> <ul style="list-style-type: none"> -- All States submit list of BART-eligible sources (i.e., 1962-77, >250 PTE, 26 categories) --BART applies if emit any pollutant "reasonably anticipated to contribute" to impairment in any class I area. <p><u>Implementation:</u> -- States conduct regional analysis of cumulative emission reductions and visibility improvement, based on category-wide application of "best controls," "Best controls" level determined by taking into account statutory factors, and taking into account existing control technology at source. Rule affirms statutory exemption process.</p> <ul style="list-style-type: none"> -- One statutory factor for BART is "degree of visibility improvement." Visibility improvement factor is addressed by regional analysis. -- Two basic options for addressing CAA BART provisions: <p>(1) Source-specific BART-- determine BART level based on statutory factors for each BART-affected source.</p> <p>(2) Trading Program in Lieu of BART - Achieve greater reasonable progress than would be achieved under source-specific BART, include sources at a minimum all sources subject to BART, achieve emission reductions during period of first long-term strategy, ensure reductions from BART sources are surplus, include procedures for implementing program.</p>
------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

PROPOSED RULE	FINAL RULE
<p>Must include in SIP the enforceable emission reduction measures, from all source categories (mobile, stationary, area, fire) needed to meet visibility target.</p>	<p>Must include in SIP the enforceable emission reduction measures, from all source categories (mobile, stationary, area, fire) needed to meet reasonable progress goal for period of long-term strategy.</p> <p>Clarifications:</p> <p>Can take credit for visibility improvement resulting from reductions under other CAA programs (e.g., reductions to attain PM NAAQS, mobile source programs).</p> <p>Emission management strategies should be appropriate to address the principal sources contributing to impairment. Rule does not require one source category to make up for deficiency by another (e.g. stationary sources and fire).</p>

PROPOSED RULE	FINAL RULE
GRAND CANYON VISIBILITY TRANSPORT COMMISSION STATES	
<p>Preamble highlighted GCVTC recommendations and took comment on how to address them in final rule.</p> <p>In preamble, noted that national rule was flexible enough to incorporate GCVTC recommendations into SIPs.</p> <p>June 1998 - Letter from WGA (signed by Gov. Leavitt) based on stakeholder process. Included specific recommendations for incorporating GCVTC recommendations in regulatory form. Requested EPA take public comment on their suggested preamble and rule language as part of the EPA process in reaching decisions on a final regional haze rule.</p> <p>EPA issued Notice of Availability of Additional Information in Sept. 1998, taking comment on WGA letter and sample translation of letter into regulatory text.</p>	<p>Overview. <p>Proposed SIP reviews every 3 or 5 years for regional haze, and requested comment on coordinating review schedule for long-term strategies dealing with reasonably attributable impairment.</p>	<p>Change from 3 year long-term strategy review cycle to 5-year cycle consistent with regional haze 5-year progress reports.</p> <p>Savings provision for continuation of requirements already in place to address reasonably attributable impairment.</p>

Senator BURNS. I better head over there and vote. The Honorable Senator from Iowa.

Senator HARKIN. I thank the Chairman.

Senator BURNS. You are going to be all by yourself.

Senator HARKIN. That is dangerous.

Senator BURNS. It certainly is.

Senator HARKIN. We can pass all kinds of things.

Senator BURNS. I wanted to adjourn.

Senator HARKIN. I want to vote.

Senator BURNS. If you can get a quorum.

AFO'S

Senator HARKIN. Thank you very much. I will just go ahead. Madam Secretary, I appreciate you being here. I have just two or three things I want to cover: Animal waste, radon and EPP, which is a shorthand for environmentally preferable products.

The administration's national strategy for animal feeding operations announced by EPA and USDA in March calls for upwards of 20,000 livestock operations to be permitted under the Clean Water Act. I have legislation pending myself calling for tighter environmental standards for large animal feeding operations. I, again, compliment and congratulate you for working with Secretary Glickman on this issue and joining forces together.

What I am concerned about is the fact that many States lack the personnel to make the regular inspections of these large animal feeding operations that would be required for meaningful environmental oversight under the Clean Water Act. Is EPA going to make additional funding available to the States? What do we need in order to get the personnel that we need for the inspections?

Ms. BROWNER. The national strategy for animal feeding operations EPA-USDA announcement—essentially requires States to demonstrate that they can run the program within their State. We provide money to the States and, in fact, this budget request continues a \$20 million increase in section 106 grants for the States. States can make a decision to use some of these funds for this program.

Many of the States have told us that they think they are going to be able to address it through prioritization within their existing resources. One of EPA's roles is to make sure that the States are able to carry through on the commitments that they are making. If a State were to fail, then we can backstop the State. For example, we could help them with the permitting aspects.

It is a relatively new program and a large undertaking. I think we have managed to provide this national backstop, so you do not have all of these differences that were unfolding among States. The second phase will be working with the States to ensure full implementation.

ENVIRONMENTAL PREFERABLE PRODUCTS

Senator HARKIN. I may have a follow-up question on that. But let me get to the other two things I wanted to cover.

My main concern on that is the personnel required. I am really concerned about how much personnel. If you need additional personnel, what kind of funding is it going to take and what do we

need to do up here on the appropriations side? How much more money do we need for those personnel?

The second thing I wanted to cover is what I call the environmental preferable products, EPP. These are consumer and industrial products made from agriculturally based substances such as soy, corn oil, ag waste, wheat straw, things like that. If we do that, that is sort of taking care of the environment in the beginning rather than in the end. For example, the Federal Government can usually avoid having to pay a high disposal cost and can easily beat environmental compliance rules. For example, rather than buying standard industrial lubricants or solvents, Federal agencies can buy bio-based equivalents made from soy oil. They meet the same performance standards. They are less toxic and you do not have the disposal problem.

In fact, the Government can help by identifying environmentally preferable products in establishing common standards. I have a couple of things here, like, the Department of Interior, I guess, is testing starch-based plates and bowls and utensils to replace polystyrene in cafeterias throughout—I guess they are going to do it throughout the Park Service and things like that.

Ms. BROWNER. This starch-based product is also used in shipping peanuts.

Senator HARKIN. Exactly. That kind of stuff. The same thing. The Postal Service is testing building materials made from straw. Anyway, there is an executive order. President Clinton issued an executive order to do this, 13101, providing that Federal agencies should find ways of using more environmentally preferable products. And, I guess, EPA ought to be in the lead in this.

My question is what is the EPA doing in moving forward toward increasing the Government's purchase of bio-based EPPs as required by the Executive Order, number one. Number two, what are the barriers you see in implementing this Executive Order, not just for you but for the rest of the Government?

This committee—and the Chairman did this last year—added a million dollars in the budget this year. And how are those funds being used?

Ms. BROWNER. The Environmentally Preferable Purchasing [EPP] program has been in existence for several years. The bio-based products are a new focus of this program. EPA, on behalf of the entire Federal Government, reviews products either through our own volition or products brought to us by manufacturers to ascertain whether or not they are environmentally preferable.

We do that in accordance with a set of protocols. Once we make that decision, the rest of the Government is informed and there is a list of products that have been certified with EPP status. One of EPP's challenges is the reviewing of the products. There can be a lot of controversy in weighing. For instance, how much energy went into making two otherwise seemingly comparable bars of soap, rather than just looking at the environmental "friendliness" of the final product.

Once we actually make the EPP these determinations, the next step is to get the other Federal agencies and departments to use the products. The example you give of the Department of Interior [DOI] is encouraging. It shows that this is not simply EPA pro-

ducing a list and then begging people to review and make use of the list. Other agencies are formulating these ideas on their own. We can work with DOI to see whether or not the starch-based plate, bowls and utensils can be certified.

Senator HARKIN. My time is up. If you cannot tell me now, maybe you can just supply to me, Ms. Browner, what the million dollars you put—what you have used that million dollars for.

[The information follows:]

ENVIRONMENTALLY PREFERABLE PRODUCTS: \$1 MILLION CONGRESSIONAL ADD

The fiscal year 1999 \$1 million Congressional Add-On for Environmentally Preferable Products is being used primarily to build infrastructure for green procurement. Approximately 75 percent of these funds will go toward engaging voluntary standard setting organizations to develop environmental standards and tools to train and provide environmental information to federal procurement officials.

SPECIFIC RESOURCE BREAKOUT

Pilots—\$405K

- pilots with third party, standards organizations
- other pilots

Tools—\$310K

- training and information tools for federal purchasers
- life cycle based decision support tool (NIST software tool)
- measurement

Outreach—\$235K

- case studies, EPP updates, outreach to federal agencies, website

Coordination—\$50K

- funds for Office of Federal Environmental Executive—support for “summit” of state/local/federal green purchasing programs

Total: \$1.0 million

Senator BOND. Thank you very much, Senator Harkin. Thank you for keeping the hearing going and now we turn back to Senator Craig.

REGIONAL HAZE: WESTERN GOVERNORS CONFERENCE

Senator CRAIG. Mr. Chairman, thank you very much. Director Browner, thank you for being with us today.

My colleague from Montana broached a couple of questions with you as it related to regional haze which remains of great concern to our Governors in the West. And I know that you had mentioned to him that one of the Governors thought that the way this was developing under your agency might be okay. Let me read a quote from an April 6 letter you got from the chairman of the Western Governors Conference in which—it does not sound like things are okay.

I will ultimately ask you why you did not follow the congressional intent last year that we established in the budget process recommending that you go back and deal with this issue.

I quote from Governor Geringer of Wyoming:

Given the rapidity with which the air frequently moves through Wyoming, we are acutely aware that air does not respect political boundaries. We believe that the regional haze and visibility can only be addressed through a cooperative and a collaborative process involving a number of States. We are committed to a regional process. Through the regional haze rules we are about to embark on a process that may drastically affect the way we do business. It is imperative that when we take the

bold steps required in addressing visibility we do it with the best set of rules possible. I must, therefore, once again urge you—

I cannot read the print here. It is a fax letter—

to repropose the rules to allow a full public process to resolve the concerns and the confusion in the currently circulated rules.

That is the chairman of the Western Governors Conference. I think that is respectful also of my Governor's concerns that we are out there dealing with something that we have not dealt with in an up-front manner. You talk about developing a cooperative relationship with States and local entities. Approximately 15 Governors from throughout the country have requested that EPA now repropose the rules. What are you doing?

Ms. BROWNER. We have finalized the rule on Thursday.

Senator CRAIG. In other words, you are not going to do it?

Ms. BROWNER. I can explain why. We worked very closely with all of the Governors who expressed interest in this. We had numerous meetings, telephone calls with Governors. We made changes in the original proposal. This effort of protecting air quality in our natural parks and wilderness areas has been underway for almost 20 years.

Senator CRAIG. I know it well. I have been with it longer than you, Carol. So what happened to last year's appropriation conference report where we encouraged EPA to repropose the regional haze rules?

Ms. BROWNER. We have worked closely with all of the interested parties to see if we could resolve differences. We believe that we have struck the appropriate balance—

Senator CRAIG. Well, I am still waiting for the call because I helped put that language in. I am one of those interested parties. I am not at all happy. We are going to come at you aggressively on this. Fifteen Governors have a right to be heard and we do not believe—

Ms. BROWNER. They were heard.

Senator CRAIG. No. They do not think so.

Ms. BROWNER. With all due respect, we have spoken to Governors. Bob Perciasepe has been on the phone with Governors including Governor Geringer and I am sure he would be happy to explain the nature of those calls in the last several weeks.

Senator CRAIG. I visited with the Governors, too. I am sure there are always two sides to a story. I am one that will accept that reality. But what I hear from the Governors is that it puts them, they find, in a very difficult situation and they do not believe that the effort was as full as you suggest it is.

Ms. BROWNER. We did repropose the western portion of the rule so that we could engage in further dialogue. I am not suggesting that every single Governor was made absolutely happy.

Senator CRAIG. And I do not believe you could probably do that.

Ms. BROWNER. It was my understanding that Governor Leavitt who was one of the leading governors—

Senator CRAIG. I am aware of the Governor's position and I visited with him on it.

Ms. BROWNER. Per our conversation with Governor Leavitt, we were under the impression that the Governor believes we were responsive to his concerns in the final rule.

REGIONAL HAZE: STATUTORY AUTHORITY

Senator CRAIG. What is the statutory authority for a regional BART in view of the specific resource requirements? How can you do that best available retrofit technology in light of what we are trying to do here?

Ms. BROWNER. The Clean Air Act provided for the best available retrofit technology. We have added to that opportunity, embodied in the Clean Air Act, a trading program, so that we could further assist the utilities and the other 26 industrial sources who will be required to retrofit, the commonly referred to grandfather sources and do it in the most cost-effective manner.

So we did go beyond simply stating the technology and looked to some of the kind of market mechanisms that we have used in other sections of the Clean Air Act.

Senator CRAIG. Carol, I think you know why I asked the question. Because when we talk about regional problems and air moving within a region, BART statutes require a specific attribution of haze to a specific source and knowledge of environmental benefits anticipated from BART controls. That is how Congress intended it, and yet you appear to be kind of spreading a broad net not specific to the intent of the law or the regulations.

Ms. BROWNER. The States have to do an inventory and they will, in accordance with the law, look at the 26 categories and make determinations in terms of sources. But rather than simply stopping there and stating what the reductions are going to be, we added to that, per a lot of input from Governors and others, a trading mechanism so that as you look across the problem you can find the most cost-effective and the cheapest reductions, rather than simply stating every single facility that shows up in the survey has to do this.

We worked very hard to strike that balance between the issues for the national parks and the wilderness areas, the economics of these older or these grandfathered facilities, and the regional component of this problem. I think this is why many of the Governors feel like we spoke to their issues.

REGIONAL HAZE: SELECTIVE BURNING

Senator CRAIG. In this instance, let me ask you, do the right hand and the left hand communicate? The right hand being EPA and these regional haze rules and Interior. Now Interior doesn't have anything to do with the Forest Service. But, as we know, Bruce Babbitt has been out recently talking about selective burns in a rather sizable manner. He was recently flying over the mountains of Idaho saying we are going to burn several hundred thousand acres here this year. Simple logic, because I was born and raised in the West, the West gets kind of hazy in the fall with burning and, that is, now the right hand and the left hand are trying to do this. So we're going to compensate on one hand by squeezing the private sector and the public sector is going to do selective burning.

Are you communicating and is there a plan where that begins to fit together?

Ms. BROWNER. Yes. Whether it be a regional haze or any of the other air pollution programs of this administration, we have continued to support selective burning.

Senator CRAIG. You should.

Ms. BROWNER. We think it provides important fire protections for the communities and for wildlife habitat. We have been very, very clear that when States look at their pollution data, the burn days, when you can monitor for the effect, are taken out of the database. We do not want people going through the expense of reducing air pollution that is attributable to burns. In no way is that what this is about. We have worked hard.

Many of the States have come to us. We have pulled data for them to segregate out those days where either there was a forest fire happening or a prescribed burn happening. We are not hearing from States complaining that this is not the case in the air quality database. If your State thinks there is something in the air quality database that was attributable to a burn, we are happy to work with them.

Senator BOND. Madam Administrator, we appreciate that particularly, since I burned my native warm season grasses this weekend and only burned one section of the fence. [Laughter.]

Senator CRAIG. You were a contributor to a regional haze and I will bet you were not in their database.

Ms. BROWNER. We are taking it out today.

Senator CRAIG. Thank you, Mr. Chairman, I will come back with another—

Senator BOND. We do have lots of questions.

Senator CRAIG. Let me conclude that your rhetoric is fine. I will tell you that not all is well with 15 Governors in the West. Thank you.

CLEAN WATER: UNMET CAPITAL NEEDS

Senator BOND. The Association of Metropolitan Sewerage Agencies has told us that the capital needs for waste water treatment are \$10 billion per year and replacement needs are \$6.2 billion per year and the annual, local and Federal expenditures are \$10.5 billion a year. That means there is a difference of \$5.7 billion, almost \$6 billion in annual unmet needs for capital in clean water. I would ask that as you develop your information that you are going to submit us on the unmet capital needs that you comment on that.

Let me turn back to the questions that my colleague from West Virginia was asking. You have stated that Federal funds cannot be used for litigation against the Federal Government; is that correct?

Ms. BROWNER. Yes.

GRANT AUDITS

Senator BOND. Okay. How many financial audits of grantees does EPA conduct each—

Ms. BROWNER. Through the IG's office?

Senator BOND. Through the grants office.

Ms. BROWNER. All grants are subject to audit review.

Senator BOND. How many audits did EPA do of grantees last year?

Ms. BROWNER. Of the grantees or of the grants?

Senator BOND. Of the grants. You do audits of the grants. Where the money went. Do you audit where the money goes?

Ms. BROWNER. Yes.

Senator BOND. And how it is used?

Ms. BROWNER. Yes. We have what are referred to as post-award management reviews, 333 last year.

Senator BOND. Out of how many? What is the universe? How many are out there, roughly?

Ms. BROWNER. The problem with this is it is apples and oranges. In terms of the number of grant awards that we made last year, we have—

Senator BOND. You can submit that for the record.

Ms. BROWNER. We will submit that.

[The information follows:]

COMPLETING FINANCIAL AUDITS

Financial audits of grantees are audits performed by either the Inspector General (IG) or by CPA firms under the auspices of OMB Circular A-133 or the Single Audit Act.¹ Grant Offices are not permitted to perform “financial audits.”

As applied in EPA, in addition to the audits performed under the Single Audit Act requirements, financial audits include the IG’s financial statement audits of the State Revolving Funds Trust Funds and financial management audits performed of grantees (examples of financial management audits include audits of accounting systems, procurement systems, internal controls, cash management procedures or expenditures under a given grant or grants). During fiscal year 1998, the IG or its representative, performed six financial audits of EPA grantees. Additionally, there were 91 single audits with findings impacting EPA. During fiscal year 1999, the IG has performed four financial audits and three audits of the SRF Trust Fund. Additionally, there have been 76 single audits issued with findings impacting EPA.

ENSURING GRANT PROGRAMMATIC AND ADMINISTRATIVE REQUIREMENTS ARE MET

The Agency is responsible for monitoring and overseeing grantees. EPA officials must perform the following certifications and steps before the grant can be formally accepted and closed out:

Role of the Program Office.—The program office’s responsibilities are to certify that the deliverables of the grant have been received and are acceptable and that the grantee has met all the programmatic terms and conditions of the grant.

Role of the Grants Management Office.—The grants management office’s responsibilities are to certify that the grantee has met all administrative requirements of the grant; reconcile grantee payments to EPA financial management system records to grantee’s financial status report and; deobligate any unliquidated obligations.

Role of the Finance Office.—The finance office is responsible for deobligating funds and setting up and collecting any accounts receivable, if necessary.

During fiscal year 1998, EPA formally closed out over 9,000 nonconstruction grants and over 4,000 grants through April 30 for fiscal year 1999.

OUTREACH AND REVIEW OF GRANTEEES

The eleven Grants Management Offices in EPA perform outreach to and review of grantees through several mechanisms such as workshops and training, technical assistance visits, evaluative onsite reviews (e.g. evaluating grantee financial management system and cost sharing documentation and validating data on financial reports) and desk reviews.

During fiscal year 1998, the Grants Management Offices performed about 468 such outreach and reviews of grantees. The number to date for fiscal year 1999 is about 480.

¹ The Single Audit Act and A-133 are intended to cover the financial audits of State and local governments and institutions of higher education and nonprofit organizations expending \$300,000 or more in grants or cost reimbursable contracts per year; that is, requires grantees to obtain audits in accordance with these requirements to determine the effectiveness of its financial management systems and internal control procedures (neither the IG or the Federal Agencies are allowed to duplicate what was done under the Single Audit Act). The Office of the Inspector General, receives notification of the all single audits with findings impacting EPA.

EPA has developed websites on the Internet, including a tutorial, providing many basic types of information for the public, including step-by-step instructions for preparing a grant application.

Senator BOND. Were these financial audits to see how the money was used or did somebody just go out and look at the——

Ms. BROWNER. No. They have to spend the money in accordance with the grant award.

Senator BOND. You did make the determination they spent the money and complied, so you could give an opinion that those were done adequately?

Ms. BROWNER. The grants that we review, the 333, are subject to the full review that every Federal agency engages in terms of grant awards.

Senator BYRD. Mr. Chairman, would you allow for a question without it being taking out of your time?

Madam Administrator, can you trace this money from the source of the grant to the expenditure of it?

Ms. BROWNER. Yes. They are required to provide us with that information. And if someone were to fail to provide us with that information, then they can be required to return the funds.

GRANT MONEY USED FOR LITIGATION

Senator BYRD. Supposed they used some other money to carry out what they purportedly are to do, that used this money which is fungible. How do you know if this money is actually being spent in accordance with your regulations and the laws?

Ms. BROWNER. We review and audit the grants to ensure that it is occurring.

I think the issue perhaps—if I might, just so we can all make sure we're understanding each other.

Senator BYRD. I do not mean to take Mr. Chairman's time.

Senator BOND. I am going to reclaim it. Don't worry about that. If you give a brief answer on that, then I have a hypothetical and maybe it will help get to the question that Senator Byrd and I want to address.

Ms. BROWNER. As a hypothetical, we'll just say it is a million-dollar organization that does any number of things. They make an application to EPA to do a specific project. When we grant that award, we make that grant, they are required to do the work under that project. They are not allowed to use grant funds to lobby. And we have withdrawn funds for that reason. They are not allowed to use it in litigation.

I think the question we are all struggling with here is because of that grant award, do they now have resources in that million dollars that they used to do something else? I think that is the question that is before us.

I think a more specific question that is before us is, do organizations get grants from EPA and then turn around, using other monies, and sue EPA? And the answer to that is yes, everybody from the National Home Builders Association to environmental organizations. However, they cannot use those grant funds to sue us, and we have rules in place. If you are under the impression that someone has done that, we will take immediate action.

Senator BOND. Let me pose to you a hypothetical. An organization that has an annual operating budget of three quarters of a million dollars and they do lots of good things. They educate school children and they have offices. They get a grant from EPA to educate school children. The grant is \$500,000. They have the existing three quarters of a million dollars. They then spend a half million dollars on legal fees to sue EPA or the Department of Transportation or the State and the city combined and use the Federal grant money plus \$250,000 left over to run their educational programs. Is this acceptable?

Ms. BROWNER. If they make an application to do specific public education and they are awarded a grant per that application, that is all they can spend that money on. They cannot—

Senator BOND. And it is not—you think it is not EPA's concern that they used—that the \$500,000 freed up enables them to sue EPA or Department of Transportation?

Ms. BROWNER. Rest assured. We do not like being sued. I do not like being the named respondent in these lawsuits. What the law allows us to do is to make a solicitation for grants and to review them. They are earmarks. There are grants that function as earmarks that go to organizations that turn around and sue us.

If I might give you a statistic that I think might bring this into focus. I think it is something that deserves attention. We were asked to look at this by another committee. We were actually asked in that committee to look at it over a 10-year period. Over a 10-year period there were over 6,000 grant recipients who got EPA grants, 6,200. During this same period of time there were approximately 2,000 lawsuits filed against EPA representing something on the order of 4,000 parties, 2,000 actual lawsuits. We can give you the case numbers and everything. Of that, in this 10-year review, 250 of the litigants in those lawsuits, their organizations had also received grants. This is over 10 years, a universe of 6,200 grants, 2,000 lawsuits of which 250 received grant funds.

They include people like General Electric, the Home Builders Association, and the Environmental Defense Fund. One of the largest recipients of grant money from EPA and one of the litigants, and one of the organizations who love to take us to court, is the American Lung Association. In community after community your local American Lung chapters are receiving funds to work with schools on asthma, and on radon. So, yes, as grant recipients, their organizations have sued us. There are rules against using our money to sue us.

GRANT AUDITS: IG'S REPORT

Senator BOND. Madam Administrator, we have the Inspector General's report. This one was 1998. He said that EPA did not fulfill its obligations to adequately monitor assistance agreement activities. The staff did not always negotiate work plans with well-defined commitments, adequately document costs.

In prior audits, they said material weaknesses: Failed to review grant applications, perform site visits, provide complete certifications. And we continue to get assurances that EPA will correct the problems. We do not see an item in the budget request that EPA is developing a policy addressing post-award management of

grants, even though it has been committed to issue this policy since 1997.

I might just ask a quick question. I believe the Inspector General Ms. Tinsley is here. On the basis of your work, can you tell us whether EPA has an understanding and a knowledge of whether any of their grant money is used for—has been used either directly or indirectly for litigation against the Government? Is EPA able to ascertain that based on your work?

Ms. TINSLEY. Our work has not shown that to date. We are developing a much broader strategy to look at how the EPA distributes funds.

Senator BOND. You continue to believe this is a material weakness?

Ms. BROWNER. I want to be clear—

Senator BOND. Let Ms. Tinsley finish. Is there anything else you want to add on that?

Ms. TINSLEY. I can add that the agency is aware that there are problems. They have recently issued a policy to do this grant oversight and to do reviews as grants are delivered to make sure that the grants identify what the grantee is going to do specifically. It is a major part of EPA's budget. It's a difficult problem. There are a lot of grantees.

Senator BOND. If you have further comments on the policy or the status of the program, we would invite you to submit it to the committee because I am getting a sense that we may not have gone far enough in ensuring that we are not using taxpayer dollars indirectly to finance lawsuits which challenge pilot policies and programs established by the Congress.

Now, Madam Administrator, you wish to comment.

Ms. BROWNER. The Inspector General I know will correct me if I am wrong, but I do not believe that the Inspector General who also looks at grant awards and does tell us when they find problems on specific grants has ever come to us and said one of your grants was used to sue you. I do not believe they have ever found one and I think she is indicating no.

Senator BOND. I think our question is, it is not whether the money is used directly. It is the fact that funds are fungible and that it is a potential to displace and utilize those resources, freeing up other funds for litigation.

Ms. BROWNER. Mr. Chairman, as I said, I don't like being sued any more than any one else likes being sued. I believe this is an issue Government-wide and I believe there are obviously constitutional issues. Organizations, simply because they receive a grant to do specific work, do not give up their right to publicly disagree with us and drag us into court.

Senator BOND. Exactly. But we, as taxpayers, do not have any obligation to keep funding. Let me turn to Senator Byrd—

CONSENT DECREES

Senator CRAIG. Mr. Chairman, could I ask that the director submit us a list that goes directly to this and that, could we find out from you, since 1993, which organizations have brought suits against EPA that have resulted in, very important here, consent

decrees which led to new requirements on the agency or the public at large?

Ms. BROWNER. That is a different question than the one we have—

Senator CRAIG. Not really.

Ms. BROWNER. I am happy to answer it. We have provided this before. I think we provided it, if not to this committee last year, a different committee. We will be happy to provide it again.

[The information follows:]

ORGANIZATIONS THAT HAVE BROUGHT LAWSUITS AGAINST EPA THAT HAVE
RESULTED IN CONSENT ORDERS THAT LED TO NEW REQUIREMENTS

Attached is a chart listing all of EPA's consent orders in defensive judicial litigation since 1989. For each consent order, the chart provides the case caption, a list of the parties to the lawsuit, the allegations in the complaint (including, for lawsuits alleging that EPA failed to carry out a non-discretionary duty by a statutory deadline, the statutory deadline), a brief description of the order, and a list of the parties that were involved in negotiation of the order.

Because some of the EPA attorneys who worked on older consent orders are no longer employed by the Agency and because some of our older litigation files contain limited information, we had some difficulty assembling this chart for some cases. However, we believe that the attached chart is reasonably accurate and complete.

Please note that virtually all the consent orders in the chart merely establish court deadlines for EPA actions that are required by statute and do not dictate the content of those actions. Where they involve a commitment to undertake rule-making, EPA's actions would be subject to the notice-and-comment provisions of the Administrative Procedure Act. Like all consent orders, each of these orders was reviewed at a high level within the Department of Justice and by a court to ensure that it was fair, reasonable, and in the public interest. In addition, it is the policy of the Department of Justice that the United States not consent to court orders which contain provisions for injunctive relief which could not be ordered by a court unilaterally. Finally, you should be aware that Section 113(g) of the Clean Air Act requires EPA to provide notice of and opportunity to comment on defensive consent orders under the Clean Air Act before they are final or filed with a court, a practice to which EPA carefully adheres.

CONSENT ORDERS RESOLVING DEFENSIVE JUDICIAL LITIGATION BETWEEN EPA AND OTHER PARTIES

[January 1, 1989-March 31, 1999 ¹]

Case	Parties to consent order (other than EPA)	Allegations in complaint against EPA, including original statutory deadline	Description of consent order	Parties present in negotiations
<i>Alabama Rivers Alliance v. Hankinson</i> , No. CV-97-S-2518-M (N.D.Ala.) and <i>Edward Mudd, II v. Hankinson</i> , No. CV-97-S-0714-M (N.D.Ala.).	Alabama Rivers Association, Edward Mudd II, Ouida Frittschi, and the Homewood Citizens Association.	Failure to establish total maximum daily loads (TMDLs) by statutory deadline (30 days from alleged constructive submission of no TMDLs) and failure to undertake monitoring necessary to identify all water quality limited segments (WQLs) in Alabama. CWA § 303(d).	EPA agreed to establish TMDLs for all WQLs on Alabama's 1996 CWA § 303(d) list by 2005 if Alabama does not do so. EPA will also develop a report evaluating and making recommendations regarding Alabama's water quality monitoring and assessment program and CWA § 303(d) listing process.	Parties to the consent order.
<i>American Littoral Society v. EPA</i> , No. 96-489 (E.D.Pa.).	American Littoral Society and Public Interest Research Group of Pennsylvania.	Failure to establish total maximum daily loads (TMDLs) and lists of impaired waters by statutory deadline (30 days from alleged constructive submission of no TMDLs or lists—7/79, as alleged by plaintiffs). CWA § 303(d). Failure to approve Pennsylvania's continuing planning process by statutory deadline (30 days from submission) and review it from time to time thereafter. CWA § 303(e). Failure to consult under ESA on list and TMDL approvals.	EPA agreed, among other things, to establish TMDLs for Pennsylvania waters not meeting water quality standards by 2009 if Pennsylvania does not do so, take final action regarding Pennsylvania's CWA § 303(d) list, develop report on Pennsylvania's monitoring and listing program, review Pennsylvania's continuing planning process, and request comment on TMDLs and lists from Fish & Wildlife Service and National Marine Fisheries Service.	Parties to the consent order and State of Pennsylvania (non-party).

<i>American Littoral Society v. EPA</i> , No. 96–591 (SLR) (D.Del.).	American Littoral Society and Sierra Club.	Failure to comply with mandatory duties, including establishment of total maximum daily loads (TMDLs) by statutory deadline (30 days from alleged constructive submission of no TMDLs or lists—7/79, as alleged by plaintiffs). CWA § 303(d). Failure to approve Delaware's continuing planning process by statutory deadline (30 days from submission) and review it from time to time thereafter. CWA § 303(e). Failure to consult under ESA on list and TMDL approvals.	EPA agreed, among other things, to establish TMDLs for Delaware waters not meeting water quality standards by 2006 if Delaware does not do so, consider basis for Delaware's 1998 listing decision and take appropriate action, develop report on Delaware's monitoring and listing program, review Delaware's continuing planning process, and request comment on TMDLs and lists from Fish & Wildlife Service and National Marine Fisheries Service.	Parties to the consent order and State of Delaware (non-party).
<i>American Lung Association of Arizona v. Browner</i> , No. Civ. 96–1856 PHX ROS (D. Ariz.).	American Lung Association of Arizona, Carolyn Aspegren, and William Grimm.	Failure to promulgate Federal implementation plan (FIP) for non-attainment area by statutory deadline (2 years after finding of failure of State implementation plan (SIP)). CAA § 110(c).	EPA agreed to a schedule for issuance of a FIP for Phoenix, Arizona ozone nonattainment area for reductions of volatile organic compounds (VOCs) under CAA § 182(b)(1).	Parties to the consent order.
<i>American Lung Association of Northern Virginia v. Browner</i> , Civ. No. 1:96 CVO 1388 (and consolidated cases Civ. No. 1:96 CVO 1392 and Civ. No. 1:96 CVO 1393) (D.D.C.).	American Lung Association, Urban Proctors, Sierra Club, Friends of the Earth, Delaware Valley Citizens Council for Clean Air, Chester Residents Concerned for Quality Living, Communities Organized to Improve Life, Odette McDonald, and Katherine Nueslein.	Failure to promulgate Federal implementation plan (FIP) for non-attainment area by statutory deadline (2 years after finding of failure of State implementation plan (SIP)). CAA § 110(c).	EPA agreed to a schedule regarding issuance of a FIP for ozone nonattainment areas in Washington, D.C., Baltimore, MD, and Philadelphia, PA for reductions of volatile organic compounds (VOCs) under CAA § 182(b)(1).	Parties to the consent order.
<i>American Lung Association v. Browner</i> , No. 92–5316 (E.D.N.Y.).	American Lung Association (ALA); ALA of Nassau (NY), Queens (NY), and Brooklyn (NY); States of Maine and New Jersey; Paul Henry, Roberto Cabbattery, Alexandra Cabbattery, and Howard Hills.	Failure to review criteria under CAA § 108 and national ambient air quality standard (NAAQS) for sulfur oxides by statutory deadline (5 years after completion of previous NAAQS review for sulfur oxides). CAA § 109(d).	EPA agreed to a schedule for review of NAAQS for sulfur oxides.	Parties to the consent order.
<i>Atlantic States Legal Foundation v. EPA</i> , No. 95–CV–1788 (N.D.N.Y.).	Atlantic States Legal Foundation	Failure to promulgate regulations identifying dangerous levels of lead in paint, dust and soil by statutory deadline of 4/28/94. TSCA § 403.	EPA agreed to schedule for promulgating regulations identifying dangerous levels of lead.	Parties to the consent order.

CONSENT ORDERS RESOLVING DEFENSIVE JUDICIAL LITIGATION BETWEEN EPA AND OTHER PARTIES—Continued

[January 1, 1989-March 31, 1999 ¹]

Case	Parties to consent order (other than EPA)	Allegations in complaint against EPA, including original statutory deadline	Description of consent order	Parties present in negotiations
<i>Brewster v. Reilly</i> , No. 90–6367–HO (D.Or.)	William L. Brewster	Failure to promulgate drinking water regulations by statutory deadline of 6/89. SDWA § 1412(b).	EPA agreed to schedules for issuing drinking water regulations.	Parties to the consent order.
<i>Bull Run Coalition v. EPA</i> , No. 88–6097 (D.Or.)	Bull Run Coalition, Citizens Interested in Bull Run, Inc., Frank Gearhart, Joseph L. Miller, Kathy Williams, Lucia N. Skov, Vera Defoe, Mark Wigg, Samuel E. Sargent, Frances Price Cook, and William L. Brewster.	Failure to promulgate drinking water regulations by statutory deadline of 12/87. SDWA § 1412(b).	EPA agreed to schedules for issuing drinking water regulations.	Bull Run Coalition.
<i>Bull Run Coalition v. EPA</i> , No. 88–6444 (D.Or.)	Bull Run Coalition, Citizens Interested in Bull Run, Inc., Frank Gearhart, Joseph L. Miller, Kathy Williams, Lucia N. Skov, Mark Wigg, Samuel E. Sargent, Frances Price Cook, William L. Brewster, Cherie Holenstein, Ralph Frohwerk, Georgia Frohwerk, and Margaret H. Thomas.	Failure to promulgate drinking water regulations by statutory deadline of 6/88. SDWA § 1412(b).	EPA agreed to schedules for issuing drinking water regulations.	Bull Run Coalition.
Citizens for Balanced Transportation v. EPA, No. 96–W–645 (D. Colo.).	Citizens for Balanced Transportation, Bob Yuhnke, and Earth Law.	Failure to promulgate federal implementation plan (FIP) for carbon monoxide and particulate matter (PM–10) for Denver within 2 years of EPA finding of SIP failure. CAA § 110(k).	EPA agreed to a schedule regarding action on SIP measures for carbon monoxide (CO) and particulate matter (PM–10) for Denver.	Parties to consent order and Colorado Air Quality Control Commission (non-party).
<i>Citizens Interested in Bull Run, Inc. v. EPA</i> , No. CIV 92–1587 (D.Or.).	Citizens Interested in Bull Run, Inc.	Failure to promulgate drinking water regulations by statutory deadline of 6/91. SDWA § 1412(b).	EPA agreed to schedules for issuing drinking water regulations.	Parties to consent order.
<i>Citizens Interested in Bull Run, Inc. v. Reilly</i> , No. 92–6258 (D.Or.).	Citizens Interested in Bull Run, Inc.	Failure to promulgate regulations requiring federal agencies to conform their procurement regulations with title VI of the CAA by statutory deadline of 5/15/92. CAA § 613.	EPA agreed to a schedule for issuing regulations requiring federal agencies to conform their procurement regulations with Title VI of the CAA.	Parties to the consent order.

<i>Citizens to Preserve the Ojai v. EPA</i> , No. CV 88–0982 HLH (C.D.Cal.).	Citizens to Preserve the Ojai	Failure to promulgate Federal implementation plan (FIP) for non-attainment area by statutory deadline (4–10 months from SIP disapproval). CAA §110(c). Response action at Drake Chemical Superfund Site violated CERCLA and RCRA and threatened human health and the environment.	EPA agreed to schedules regarding issuance of a FIP for ozone for the Ventura Air Quality Management District.	Parties to the consent order.
<i>Clinton County Commissioners v. EPA</i> , No. 4:CV–96–00181 (M.D.Pa.).	Clinton County Commissioners and Arrest the Incinerator Remediation, Inc.		EPA agreed to discontinue soil excavation and incinerator test operations at Drake Chemical Superfund Site until further risk analysis was completed by EPA and the court issued a ruling with respect to plaintiffs' 2/96 motion for a preliminary injunction.	Parties to the consent order.
<i>Clinton County Commissioners v. EPA</i> , No. 4:CV–96–00181 (M.D.Pa.).	Clinton County Commissioners and Arrest the Incinerator Remediation, Inc.	Response action at Drake Chemical Superfund Site violated CERCLA and RCRA and threatened human health and the environment.	Upon plaintiffs' motion for injunctive relief pending appeal, EPA agreed not to commence full-scale operation of the incinerator before 5/15/97 or before Court of Appeals for the Third Circuit issued decision (in exchange for plaintiffs' agreement that EPA could proceed with test operations).	Parties to the consent order.
<i>Coalition for Clean Air, Inc. v. EPA</i> , No. CV 88–4414 HLH (C.D. Cal.).	Coalition for Clean Air, Inc., and Sierra Club.	Failure to promulgate Federal implementation plan (FIP) for non-attainment area by statutory deadline (4–10 months from SIP disapproval). CAA §110(c).	EPA agreed to schedules regarding issuance of FIPs for carbon monoxide (CO) and ozone for the South Coast Air Quality Management District.	Parties to the consent order.
<i>Coalition for Clean Air, Inc. v. EPA</i> , No. 97–6916 (C.D.Cal.).	Coalition for Clean Air, Inc., Natural Resources Defense Council, Inc., and Communities for a Better Environment.	Failure to fulfill commitment in approved California ozone State implementation plan (SIP) approval to make certain determinations by 12/31/97 as part of a public consultative process on Federal and State measures. Complaint was amended in 1998 to include this claim.	EPA agreed to a schedule to conclude the public consultative process on the California ozone SIP.	Parties to the consent order.
<i>Cook v. Reilly</i> , No. 89–6307E (D.Or.)	Frances P. Cook and Citizens Interested in Bull Run, Inc.	Failure to issue standards of performance for stationary source by statutory deadline (4 years after the category is listed under CAA §111(b)). CAA §111.	EPA agreed to a schedule for regulation of emissions of volatile organic compounds (VOCs) from dry cleaners under CAA §111.	Parties to the consent order.

CONSENT ORDERS RESOLVING DEFENSIVE JUDICIAL LITIGATION BETWEEN EPA AND OTHER PARTIES—Continued

[January 1, 1989-March 31, 1999 ¹]

Case	Parties to consent order (other than EPA)	Allegations in complaint against EPA, including original statutory deadline	Description of consent order	Parties present in negotiations
<i>Cronin v. Browner</i> , No. 93-0314 (AGS) (S.D. N.Y.).	John J. Cronin, the Hudson Riverkeeper, Cynthia E. Poten, the Delaware Riverkeeper, The Hudson Riverkeeper Fund, Inc., The New York Coastal Fishermen's Association, Inc., The American Littoral Society, Inc., Michael Lozeau, the San Francisco BayKeeper, BJ Cummings, the Puget Soundkeeper, Terrance E. Backer, the Soundkeeper, The Long Island Soundkeeper Fund, Inc., Andrew Willner, the Baykeeper for the New York and New Jersey Harbor Estuary, Joseph E. Payne, the Casco BayKeeper, Terrance Tamminen, the Santa Monica BayKeeper, John Torgan, the Narragansett BayKeeper, Save the Bay, Inc.	Failure to promulgate regulations for cooling water intake structures by statutory deadline of 2/15/74 for new sources and 7/1/77 for existing sources. CWA §§ 301(b), 306, and 316(b).	EPA agreed to propose regulations for cooling water intake structures by 7/2/99 and take final action by 8/13/01.	Parties to the consent order.
<i>Defend the Bay, Inc. v. Marcus</i> , No. 97-3997 MMC (N.D.Cal.).	Defend the Bay, Inc	Failure to establish total maximum daily loads (TMDLs) for Newport Bay by statutory deadline (30 days from alleged constructive submission of no TMDLs—6/79, as alleged by plaintiffs). CWA § 303(d). Failure to disapprove California's 1994 CWA § 303(d) list for impaired waters despite omission of Newport Bay.	EPA agreed to establish TMDLs for Newport Bay by 2001 if California does not do so.	Parties to the consent order.

<i>Defenders of Wildlife v. Browner</i> , No. CIV 93-234 TUC ACM (D.Ariz.).	Defenders of Wildlife, George Marsik, Jerry Van Gasse, and James Singluff.	Failure to act on Arizona's submission of water quality standards by statu- tory deadline of 5/92; failure to pro- pose federal water quality standards by statutory deadlines of 12/9/93 and 7/29/94; failure to establish total maximum daily loads (TMDLs) by statutory deadline (30 days from alleged constructive submission of no TMDLs); CWA § 303 (c) and (d). Failure to implement Federal imple- mentation plan (FIP) commitments that came due at various times in mid-1990's. CAA § 110(c). Failure to promulgate drinking water regulations by statutory deadline of 6/89. SDWA § 1412(b). Failure to revise regulations governing mixtures and treatment residues of hazardous waste by statutory dead- line of 10/1/94. Pub. L. No. 102-389 (1992).	EPA agreed to take final action on water quality standards submitted by Arizona under CWA § 303(c) by 4/ 30/94; EPA agreed to establish TMDLs for mercury in certain waters in Arizona by 2001 if Arizona does not do so.	Parties to the consent order.
<i>DiSimone v. Browner</i> , No. 97-1987 (D.Ariz.)	Barry DiSimone and Donald Steuter (represented by Arizona Center for Law in the Public Interest).		EPA agreed to a schedule for rule- making to implement the FIP for carbon monoxide in Phoenix, Arizona.	Parties to the consent order.
<i>Donison v. Browner</i> , No. CIV 92-6280-HO (D.Or.).	Clare Donison, Ralph Frower, Frank Gearhart, Kathy Williams, and Citi- zens Interested in Bull Run, Inc.		EPA agreed to schedules for issuing drinking water regulations under SDWA.	Parties to the consent order.
<i>Environmental Technology Council v. Browner</i> , Nos. 94-2119 and 94-2346 (D.D.C.).	Environmental Technology Council and Edison Electric Institute.		EPA agreed to a rulemaking schedule regarding revisions to a specific section of the regulatory definition of hazardous waste, including pos- sible exemptions from hazardous waste regulation.	Parties to the consent order; Chemical Manufacturers As- sociation (intervenor), the American Forest and Paper Association (intervenor), the Chamber of Commerce of the United States (inter- venor), the American Iron and Steel Institute (inter- venor), the American Petro- leum Institute (intervenor), and The Fertilizer Institute (intervenor).
<i>Environmental Defense Fund v. Browner</i> , No. 89- 0598 (D.D.C.).	Environmental Defense Fund	Failure to determine whether certain hazardous wastes should be listed as hazardous wastes by statutory deadline of 2/8/86 (RCRA § 3001(e)); failure to promulgate toxicity characteristic by statutory deadline 3/8/87 (§ 3001(g)).	Required EPA to complete several RCRA rulemakings required by stat- ute by various dates, including de- termining whether certain solid wastes should be listed as haz- ardous wastes and producing stud- ies of certain wastes.	Parties to the consent order.

CONSENT ORDERS RESOLVING DEFENSIVE JUDICIAL LITIGATION BETWEEN EPA AND OTHER PARTIES—Continued

[January 1, 1989-March 31, 1999 ¹]

Case	Parties to consent order (other than EPA)	Allegations in complaint against EPA, including original statutory deadline	Description of consent order	Parties present in negotiations
<i>Environmental Defense Fund v. EPA</i> , No. 91–0429 (D.D.C.).	Environmental Defense Fund	Failure to determine whether mining wastes should be regulated under RCRA Subtitle C by statutory deadline of 1/31/91 (RCRA § 3001(b)).	Required EPA to issue regulatory determination under RCRA § 3001(b) regarding status of mineral processing wastes under Subtitle C of RCRA by 5/20/91.	Parties to the consent order.
<i>Environmental Defense Fund v. EPA</i> , No. 92–1636 (N.D.Cal.).	Environmental Defense Fund, Sierra Club, and Carla Baird.	Failure to promulgate conformity rule by statutory deadline of 11/15/91. CAA § 176(c)(4)(A).	EPA agreed to a schedule for issuance of conformity rules under CAA § 176(c)(4).	Parties to the consent order.
<i>Environmental Defense Fund v. Reilly</i> , No. 85–9507 (S.D.N.Y.).	Environmental Defense Fund, Natural Resources Defense Council, Inc., National Parks and Conservation Association, and States of New York, Connecticut, Massachusetts, New Hampshire, Minnesota, and Rhode Island.	Failure to review criteria under CAA § 108 and secondary national ambient air quality standard (NAAQS) for sulfur oxides by statutory deadline (5 years after completion of previous secondary sulfur oxides NAAQS review). CAA § 109(d).	EPA agreed to a schedule to review the secondary NAAQS for sulfur oxides under CAA § 109(d).	Parties to the consent order.
<i>Forest Guardians v. EPA</i> , Civ. No. 96–0826 LH (D.N.M.).	Forest Guardians and Southwest Environmental Center.	Failure to establish total maximum daily loads (TMDLs) by statutory deadline (30 days from alleged constructive submission of no TMDLs—7/79, as alleged by plaintiffs). CWA § 303(d).	EPA agreed to establish TMDLs for all water quality limited segments on New Mexico's 1998 CWA § 303(d) list by 2006 if New Mexico does not do so.	Parties to the consent order.
<i>Frohwerk v. Reilly</i> , No. CIV 91–6549–TC (D.Or.)	Ralph Frower, Citizens Interested in Bull Run, Inc., Frank Gearhart, Joseph Miller and Kathy Williams.	Failure to promulgate drinking water regulations by statutory deadline of 6/89. SDWA § 1412(b).	EPA agreed to schedules for issuing drinking water regulations.	Parties to the consent order.
<i>Frohwerk v. Reilly</i> , No. CIV 90–6363–JO (D.Or.)	Ralph Frower, Frank Gearhart, Kathy Williams, William L. Brewster and Citizens Interested in Bull Run, Inc.	Failure to promulgate drinking water regulations by statutory deadline of 6/90. SDWA § 1412(b).	EPA agreed to schedules for issuing drinking water regulations.	Parties to the consent order.

<i>Gearhart v. Browner</i> , Civil No. 89-6266-HO (D.Or.).	Frank Gearhart, Citizens Interested in Bull Run, Inc., Kathy Williams, Frances Price Cook, Natural Resources Defense Council, Inc. (intervenor), and Association of Municipal Sewage Authorities (AMSA) (intervenor).	Failure to propose and promulgate regulations for sewage sludge by statutory deadlines (propose round one—11/30/86; promulgate round one—8/31/87; propose round two—7/31/87; promulgate round two—6/15/88; CWA § 405(d).	EPA agreed to issue sewage sludge regulations under CWA § 405 as follows : promulgate round one—11/25/92; notice of round two pollutants—5/24/93; propose round two—12/15/99; promulgate round two—12/15/01.	Natural Resources Defense Council, Inc. and all plaintiffs.
<i>Gearhart v. Reilly</i> , No. 91-2435 (D.D.C.)	Bull Run Coalition, Frank Gearhart, and Edison Electric Institute.	Failure to submit a report to Congress on fossil fuel combustion wastes by statutory deadline of 10/21/82; failure to determine whether to regulate these wastes under RCRA Subtitle C by statutory deadline (6 months after submission of report to Congress). RCRA § 3001(b).	Required EPA to submit report to Congress and to issue regulatory determinations under RCRA § 3001(b) regarding the status under of fossil fuel combustion wastes under Subtitle C of RCRA by various dates.	Parties to the consent order.
<i>Golden Gate Audubon Society v. Browner</i> , No. CIV-5-93 646 LKK PAN (E.D.Cal.).	Golden Gate Audubon Society, Marin Audubon Society, Santa Clara Audubon Society, Ohlone Audubon Society, Mount Diablo Audubon Society, Sequoia Audubon Society, Madrone Audubon Society, Point Reyes Bird Observatory, Environmental Defense Fund, Natural Resources Defense Council, Inc., The Bay Institute, Save San Francisco Bay Association, Pacific Coast Fisheries Associations, California Native Plant Society, Citizens for a Better Environment, United Anglers of California, Sierra Club, and Streamrinders Chapter of the Izaak Walton League.	Failure to promptly propose water quality standards; failure to promulgate standards by statutory deadline (90 days after proposal). CWA § 303(c).	EPA agreed to propose and promulgate water quality standards for the San Francisco Bay Delta by 12/93, and 12/94, respectively.	Sierra Club Legal Defense Fund represented plaintiffs.

CONSENT ORDERS RESOLVING DEFENSIVE JUDICIAL LITIGATION BETWEEN EPA AND OTHER PARTIES—Continued

[January 1, 1989-March 31, 1999 ¹]

Case	Parties to consent order (other than EPA)	Allegations in complaint against EPA, including original statutory deadline	Description of consent order	Parties present in negotiations
<i>Heal the Bay, Inc., v. Carol Browner</i> , No. C98-4825 (SBA) (N.D.Cal.).	Heal the Bay, Inc., Santa Monica BayKeeper, Inc., and Terry Tamminen.	Failure to establish total maximum daily loads (TMDLs) by statutory deadline (30 days after alleged constructive submission of no TMDLs); failure to review State continuing planning process from time to time; failure to monitor as necessary to identify all water quality limited segments. CWA § 303(d).	EPA agreed to backstop development of TMDLs for the Los Angeles region of California by 2012. EPA also agreed to review the State's continuing planning process and to develop a report evaluating the State's monitoring program.	Natural Resources Defense Council, Inc., Heal the Bay, Inc., and Santa Monica BayKeeper, Inc.
<i>Institute for Energy and Environmental Research v. EPA</i> , No. 93-2266 (D.D.C.).	Not known. In process of obtaining consent decree from DOJ archives.	Failure to act on petition to add substance to list of class I substances by statutory deadline (1 year after receipt of petition). CAA § 602(c)(3).	EPA agreed to a schedule to take action on a petition to list certain hydrochlorofluorocarbons (HCFCs) as class I ozone depleting substances under CAA § 602(c).	Parties to the consent order.
<i>Kansas Natural Resource Council, Inc. v. Browner</i> , No. 95-2490-JWL (D.Kan.).	Kansas Natural Resource Council, Inc., Sierra Club, and State of Kansas (intervenor/defendant).	Failure to establish total maximum daily loads (TMDLs) and lists of impaired waters by statutory deadline (30 days after constructive submission of no TMDLs or lists—7/79, as alleged by plaintiffs). CWA § 303(d). Failure to approve Kansas' continuing planning process by statutory deadline (30 days after submission—3/73, as alleged by plaintiffs); failure to review continuing planning process from time to time. CWA § 303(e).	EPA agreed, among other things, to establish TMDLs for Kansas waters not meeting water quality standards by 2006 if Kansas does not do so, and to review Kansas' continuing planning process.	Parties to the consent order.
<i>Legal Environmental Assistance Foundation v. Browner</i> , No. CV-96-ETC-2454-S (N.D.Ala.).	Legal Environmental Assistance Foundation.	Failure to promptly propose federal water quality standards. CWA § 303(c).	EPA agreed to either propose water quality standards for Alabama or withdraw outstanding disapprovals of Alabama water quality standards by 2/98.	Parties to the consent order.

<i>Legal Environmental Assistance Foundation, v. Browner</i> , Civ. No. 92-40252-WS (N.D.Fla.).	Legal Environmental Assistance Foundation.	Failure to promptly propose water quality standards; failure to promulgate standards by statutory deadline (90 days after proposal). CWA § 303(c).	EPA agreed to promulgate revised water quality standards for Florida within 22 months unless Florida adopts revised standards addressing EPA's previous disapproval.	Parties to the consent order.
<i>Maryland Environmental Interest Group v. Reilly</i> , No. 92-1225 (D.D.C.).	Maryland Environmental Interest Group, Lisa Satterfield, and Sierra Club.	Failure to promulgate regulations regarding the use and disposal of certain class I substances during the servicing of refrigeration systems by statutory deadline of 1/1/92. CAA § 608(a)(1).	EPA agreed to a schedule for issuing final rule on use and disposal of Class I substances during servicing of refrigeration systems under CAA § 608(a)(1).	Parties to the consent order.
<i>Miller v. EPA</i> , No. 89-6328 (and consolidated cases <i>Frohwerk v. EPA</i> , No. 90-6363, <i>Citizens Interested in Bull Run</i> , No. 92-1587, <i>Frohwerk v. EPA</i> , No. 91-6549, and <i>Donison v. EPA</i> , No. 92-6280) (D.Or.).	Joseph L. Miller, Ralph Frohwerk, Citizens Interested in Bull Run, Inc., Kathy Williams, and Clare Donison.	Failure to promulgate drinking water regulations by statutory deadline of 6/87 (Miller). SDWA § 1412(b).	EPA agreed to schedules for issuing drinking water regulations.	Parties to consent order.
<i>National Wildlife Federation v. Browner</i> , No. 97-1504-HHK (D.D.C.).	National Wildlife Federation, Great Lakes Water Quality Coalition, and State of New York (defendant).	Failure to promulgate by statutory deadline of 3/23/97 federal water quality standards for Great Lakes States that failed to make timely submissions of state water quality programs. CWA § 118(c)(3).	EPA agreed to promulgate by 2/27/98 federal water quality standards for Great Lakes States that did not make timely submissions of State programs under CWA § 118.	Parties to the consent order.
<i>National Wildlife Federation v. Browner</i> , No. 92-2338-CCR (D.D.C.).	National Wildlife Federation	Failure to issue water quality guidance for the Great Lakes System by statutory deadline of 6/20/92. CWA § 118(c)(2).	EPA agreed to promulgate Great Lakes Water Quality Initiative Guidance under CWA § 118 by 3/13/95.	Parties to the consent order.
<i>Natural Resources Defense Council, Inc. v. Browner</i> , No. 95-634 (PLF) (D.D.C.).	Natural Resources Defense Council, Inc.	Failure to promulgate regulations for storm water discharges by statutory deadline of 10/1/93. CWA § 402(p)(6).	EPA agreed to propose (by 12/97) and take final action (by 10/99) on rule-making for regulation of storm water discharges under CWA § 402(p)(6) ("Phase 2").	Parties to the consent order.
<i>Natural Resources Defense Council, Inc. v. EPA</i> , No. 92-2093 (E.D.N.Y.) and <i>Sierra Club v. EPA</i> , No. 93-0284 (E.D.N.Y.).	Natural Resources Defense Council, Inc. and Sierra Club.	Failure to promulgate new source performance standards for solid waste incinerators by statutory deadline (11/15/91 for municipal waste combustors and 11/15/92 for medical waste incinerators). CAA § 129(a)(1)(A).	EPA agreed to a schedule regarding issuance of standards of performance for municipal solid waste and medical waste incinerators under CAA § 129.	Parties to the consent order.

CONSENT ORDERS RESOLVING DEFENSIVE JUDICIAL LITIGATION BETWEEN EPA AND OTHER PARTIES—Continued

[January 1, 1989-March 31, 1999 ¹]

Case	Parties to consent order (other than EPA)	Allegations in complaint against EPA, including original statutory deadline	Description of consent order	Parties present in negotiations
<i>Natural Resources Defense Council, Inc. v. EPA</i> , No. 90–0694 (D.D.C.).	Natural Resources Defense Council, Inc., Hazardous Waste Treatment Council, and Association of Petroleum Re-refiners.	Failure to determine whether used oil should be listed as a hazardous waste by statutory deadline (proposal—11/8/85; final rule—11/8/86). RCRA § 3014(b).	EPA agreed to determine whether non-recycled used oil should be listed as a hazardous waste by 5/1/92.	Parties to the consent order.
<i>Natural Resources Defense Council, Inc. v. EPA</i> , No. 92–2369 (D.N.J.).	Natural Resources Defense Council, Inc. and New Jersey Public Interest Research Group.	Failure to issue national toxics water quality standards rule by statutory deadline of 2/92. CWA § 303(c).	Agreement on attorneys fees and dismissal of underlying action challenging national toxics water quality standards rule.	Parties to the consent order.
<i>Natural Resources Defense Council, Inc. v. EPA</i> , No. 93–1946 (D.D.C.).	Natural Resources Defense Council, Inc.	Failure to act on petition to add substance to list of Class I substances by statutory deadline (1 year after receipt of petition). CAA § 602(c)(3). Failure to promulgate regulations to phase out production of Class I substances by statutory deadline of 9/15/91. CAA § 604(c).	EPA agreed to a schedule to take action on a petition to add methyl bromide to list of Class I substances, and accelerate phase out of certain chlorofluorocarbons (CFCs) under CAA §§ 601 and 604.	Parties to the consent order.
<i>Natural Resources Defense Council, Inc. v. Reilly</i> , No. 88–3199 (D.D.C.).	Natural Resources Defense Council, Inc.	Failure to promulgate revisions to CERCLA National Contingency Plan (NCP) by statutory deadline of 4/17/88. CERCLA § 105(b).	EPA agreed to promulgate revisions to the CERCLA NCP Plan by 2/5/90.	Parties to the consent order.
<i>Natural Resources Defense Council, Inc. v. Reilly</i> , No. 92–1137 (consolidated with Nos. 92–1142, 92–1157, 92–1222, 92–1260, and 92–1243) (D.C. Cir.).	Natural Resources Defense Council, Inc.	Petitioner sought review of EPA decision not to require on-board vapor recovery for autos under CAA § 202(a)(6) (which established statutory deadline of 11/15/91 for promulgation of on-board standards). On remand to EPA, petitioners sought a schedule for Agency action consistent with D.C. Circuit's opinion.	EPA agreed to a schedule after remand in <i>NRDC v. Reilly</i> , 983 F.2d 259 (D.C. Cir. 1993), concerning onboard vapor recovery for cars under CAA § 202(a)(6).	Parties to the consent order.

<i>Natural Resources Defense Council, Inc. v. Browner</i> , No. 89-2980 (D.D.C.).	Natural Resources Defense Council, Inc., Public Citizen, Inc., American Forest & Paper Association (intervenor), and Chemical Manufacturers Association (intervenor).	Failure to promulgate by statutory deadline of 2/4/91 effluent guidelines in accordance with required plan; failure to issue required plan by statutory deadline of 2/4/88. CWA §§301(b), 304(m), 306(b) and 307(b).	EPA agreed to propose and take final action with respect to effluent guidelines for 12 point source categories, ending in 2003; EPA agreed to conduct studies for 11 point source categories; EPA agreed to provide plaintiffs with a semi-annual status report. Consent order entered in 1992, amended in 1997 and thereafter.	Parties to the consent order.
<i>Nelson v. Reilly</i> , No. 92-6260 (D.Or.)	Nelson, Gearhart, Kelly, and Citizens for Bull Run, Inc.	Failure to revise certification test procedures for light-duty trucks and vehicles by statutory deadline of 11/15/91. CAA § 206(a)(4)(A).	EPA agreed to a schedule regarding issuance of certification test procedures under CAA § 206(a)(4)(A).	Parties to the consent order.
<i>Northwest Environmental Advocates v. EPA</i> , No. C91-427 (W.D.Wash.).	Northwest Environmental Advocates and Northwest Environmental Defense Center.	Failure to approve or disapprove Washington's CWA § 303(d) list and total maximum daily loads (TMDLs) by statutory deadline (30 days after State's submission); failure to establish reasonable schedule for TMDL development; failure to disapprove Washington's continuing planning process and NPDES permit program as of 7/27/79. CWA § 303(d).	EPA agreed to establish 38 TMDLs in 5 years if Washington does not do so.	Parties to the consent order and State of Washington (non-party).
<i>Northwest Environmental Advocates v. EPA</i> , No. C94-1666R (W.D.Wash.).	Northwest Environmental Advocates and Northwest Environmental Defense Center.	Failure to approve or disapprove Oregon's list of water quality limited waters by statutory deadline (30 days after State's submission). CWA § 303(d).	EPA agreed to exercise all reasonable diligence to see that Oregon's 1994 CWA § 303(d) list was submitted before 9/30/95 and approved no later than 11/30/95.	Parties to the consent order.
<i>Ober v. Browner</i> , No. CIV 94-1318 PHX PGR (D.Ariz.).	Edward Ober and Robin Silver (represented by Arizona Center for Law in the Public Interest).	Failure to promulgate Federal implementation plan (FIP) for non-attainment area by statutory deadline of 3/4/94. CAA § 110(c).	EPA agreed to a schedule regarding issuance of a FIP for particulate matter (PM-10), for the Phoenix, Arizona area.	Parties to the consent order.

CONSENT ORDERS RESOLVING DEFENSIVE JUDICIAL LITIGATION BETWEEN EPA AND OTHER PARTIES—Continued

[January 1, 1989-March 31, 1999 ¹]

Case	Parties to consent order (other than EPA)	Allegations in complaint against EPA, including original statutory deadline	Description of consent order	Parties present in negotiations
<i>Ohio Valley Environmental Coalition, Inc. v. Browner</i> , Nos. 2:95–0529, 2:96–0091 (S.D.W.Va.).	Ohio Valley Environmental Coalition, Inc., West Virginia Highlands Conservancy, Inc., Rogenia Fout, Thomas E. Keating, and Bill Ragette.	Failure to establish total maximum daily loads (TMDLs) and lists of impaired waters by statutory deadline (30 days after alleged constructive submission of no TMDLs or lists—7/79, as alleged by plaintiffs). CWA § 303(d).	EPA agreed, among other things, to establish TMDLs for West Virginia waters not meeting water quality standards by 2006 if West Virginia does not do so, and consider certain factors in reviewing West Virginia's lists of impaired waters.	Parties to the consent order; West Virginia Chamber of Commerce, West Virginia Coal Association, West Virginia Farm Bureau, West Virginia Forestry Association, West Virginia Mining and Reclamation Association (intervenors).
<i>Oregon Natural Resources Council, Inc. v. Browner</i> , No. 93–79 (D.Or.).	Oregon Natural Resources Council	Failure to promulgate rule establishing specifications for detergent additives for gasoline by statutory deadline of 11/15/92. CAA § 211(l).	EPA agreed to a schedule for issuing rules on detergent additives for gasoline under CAA § 211(l).	Parties to the consent order.
<i>Oregon Natural Resources Council, Inc. v. Reilly</i> , No. 91–6529 (D.Or.).	Oregon Natural Resources Council and individual citizen plaintiffs.	Failure to review criteria under CAA § 108 and national ambient air quality standard (NAAQS) for nitrogen dioxide (NO ₂) by statutory deadline (5 years after completion of previous NO ₂ NAAQS review). CAA § 109(d).	EPA agreed to a schedule for review of NAAQS for NO ₂ under CAA § 109(d).	Parties to the consent order.
<i>Pacific Coast Federation of Fishermen's Associations v. Marcus</i> , No. 95–4474 MHP (N.D.Cal.).	Pacific Coast Federation of Fishermen's Association, Golden Gate Fishermen's Association, Sierra Club, Environmental Protection Information Center, Coast Action Group, Friends of the Garcia California Trout, Klamath Forest Alliance, Mendocino Environmental Center, Willits Environmental Center, California Wilderness Coalition, Friends of the Navarro, South Fork Mountain Defense Committee, Northcoast Environmental Center.	Failure to establish total maximum daily loads (TMDLs) for 17 North Coast rivers that California included in its 1994 CWA § 303(d) list of impaired waters by statutory deadline (30 days after alleged constructive submission in 12/94 of no TMDLs for those listed rivers). CWA § 303(d).	EPA agreed to establish TMDLs for the 17 North Coast rivers by 2008 if California does not do so.	Parties to the consent order.

<i>Sierra Club v. Browner</i> , No. 96–1747 (consolidated with No. 95–463) (D.D.C.).	Sierra Club	Failure to take various actions concerning air toxics by statutory deadlines in CAA § 112, failure to promulgate emissions standards for locomotives by statutory deadline of 11/15/92. CAA § 213(a)(5).	EPA agreed to a schedule to take various actions regarding air toxins under CAA §§ 112 (c)(3), (c)(6), and (k)(3), and 2020(i)(2). EPA agreed to a schedule for issuing rules on locomotives under CAA § 213(a)(5).	Parties to the consent order; American Petroleum Institute, American Automobile Manufacturers Association, and International Automobile Manufacturers (intervenor). Parties to the consent order.
<i>Sierra Club v. Browner</i> , No. 93–0124 (consolidated with Nos. 93–0125, 93–0197, and 93–0564) (D.D.C.).	Sierra Club and Natural Resources Defense Council, Inc.	Failure to take actions by statutory deadlines under a variety of different CAA provisions, including §§ 112(d) (11/15/92), 111 (11/15/92), 112(e) (11/15/92), 612 (11/15/92), 407(c) (proposal—1/1/93; final—1/1/94), 112(n)(5) (11/15/92) and 112(s) (1/15/93).	EPA agreed to a schedule for miscellaneous CAA actions.	
<i>Sierra Club v. Browner</i> , No. 93–2644 (NH) (D.D.C.).	Sierra Club	Failure to promulgate regulations for Class V underground injection wells by statutory deadline of 12/75. SDWA § 1421(a).	EPA agreed to schedules for issuing study and proposed and final rule-making determinations for Class V underground injection wells.	Parties to the consent order (represented by Earth Justice).
<i>Sierra Club v. Browner</i> , No. 95–627 (D.D.C.)	Sierra Club	Failure to promulgate regulations regarding the use and disposal of certain class I and class II substances by statutory deadline of 11/15/94. CAA § 608(a)(2).	EPA agreed to a schedule to issue regulations pertaining to halons and methyl bromide under CAA § 608(a)(2).	Parties to the consent order.
<i>Sierra Club v. Browner</i> , No. 95–627 (D.D.C.)	Sierra Club	Failure to issue guidance concerning physical and operational changes at major sources of hazardous air pollutants (HAPs) by statutory deadline of 5/15/92. CAA § 122(g)(1)(B).	EPA agreed to a schedule to issue guidance concerning construction of major sources of HAPs under CAA § 112(g).	Parties to the consent order.
<i>Sierra Club v. Browner</i> , No. 95–627 (D.D.C.)	Sierra Club	Failure to submit study on mercury emissions to Congress by statutory deadline of 11/15/94. CAA § 112(n)(1)(B). Failure to promulgate emission standards for hazardous air pollutants for source category by statutory deadline of 11/15/94. CAA § 112(e).	EPA agreed to a schedule for study on mercury under CAA § 112(n)(1)(B), and to promulgate standards for certain categories of sources under CAA § 112(d).	Parties to the consent order.

CONSENT ORDERS RESOLVING DEFENSIVE JUDICIAL LITIGATION BETWEEN EPA AND OTHER PARTIES—Continued

[January 1, 1989-March 31, 1999 ¹]

Case	Parties to consent order (other than EPA)	Allegations in complaint against EPA, including original statutory deadline	Description of consent order	Parties present in negotiations
<i>Sierra Club v. Browner</i> , No. 96–1680 (D.C. Cir.) ...	Sierra Club, National Wildlife Federation, and Chesapeake Bay Foundation.	Failure to submit report to Congress concerning atmospheric deposition to the Great Waters by statutory deadline of 11/15/93. CAA § 112(m)(5). Failure to promulgate regulations to prevent harmful atmospheric deposition to the Great Waters by statutory deadline of 11/15/95. CAA § 112(m)(6).	EPA agreed to a schedule for actions concerning atmospheric deposition to the Great Waters under CAA §§ 112(m)(5) and 112(m)(6).	Parties to the consent order.
<i>Sierra Club v. Browner</i> , No. 97–0675 (D.D.C.)	Sierra Club	Failure to submit report to Congress on residual risk by statutory deadline of 11/15/96. CAA § 112(f)(1). Failure to promulgate regulations for solid waste incinerators by statutory deadline of 11/15/94. CAA § 129(a)(1)(D).	EPA agreed to a schedule for report to Congress on residual risk under CAA § 112(f)(1), and promulgation of regulations for solid waste incinerators under CAA § 129(a)(1)(D).	Parties to the consent order.
<i>Sierra Club v. Browner</i> , No. 97–1984 PLF (D.D.C.)	Sierra Club	Failure to promulgate best available control regulations for emissions of volatile organic compounds (VOCs) from consumer and commercial products by statutory deadline of 3/15/97. CAA § 183(e)(3).	EPA agreed to a schedule for issuing rules on consumer/commercial products under CAA § 183(e).	Parties to the consent order (represented by Earth Justice).
<i>Sierra Club v. Browner</i> , No. 97–3004 (D.D.C.)	Sierra Club	Failure to submit report to Congress concerning the results of Phase II study of certain light-duty vehicles and trucks by statutory deadline of 6/1/97. CAA § 202(l)(2)(B).	EPA agreed to a schedule for Tier 2 study concerning light-duty vehicles and trucks under CAA § 202(l).	Parties to the consent order and American Automobile Manufacturers Association.

<i>Sierra Club v. EPA</i> , No. 94–0553; <i>Sierra Club v. EPA</i> , No. 94–0954 (D.D.C.).	Sierra Club	Failure to take actions by statutory deadlines under a variety of different CAA provisions, including §§ 112(k)(2) (11/15/93), 603(d)(1) (11/15/93), 404 (11/15/93), 112(n)(1) (11/15/93), and 129(a) (11/15/93).	EPA agreed to a schedule for miscellaneous CAA actions.	Parties to the consent order.
<i>Sierra Club v. EPA</i> , No. 97–3888 (N.D.Cal.)	Sierra Club	Failure to act on submission of state implementation plan (SIP) by statutory deadline (12 months from complete SIP submission). CAA § 110(k).	EPA agreed to a schedule for action on SIP in San Francisco Bay Area under CAA § 110.	Parties to the consent order.
<i>Sierra Club v. Hankinson</i> , No. 1:94–CV–2501–MHS (N.D.Ga.).	Sierra Club, Georgia Environmental Organization, Inc., Coosa River Basin Initiative, Inc., Trout Unlimited, and Ogeechee River Valley Association, Inc.	Failure to establish total maximum daily loads (TMDLs) by statutory deadline (30 days after constructive submission of no TMDLs—7/79, as alleged by plaintiffs); failure to disapprove State's list of impaired waters; failure to establish a schedule for the submission of all TMDLs in Georgia. CWA § 303(d).	EPA agreed to a schedule for (1) the establishment of TMDLs for Georgia waters not meeting water quality standards by 2005 if Georgia does not do so; (2) the evaluation of certain information relating to Georgia's CWA § 303(d) lists; and (3) making certain decisions regarding the content of Georgia's CWA § 303(d) lists.	Parties to the consent order.
<i>Sierra Club v. Hankinson</i> , No. 97–CV–3683 (N.D.Ga.).	Sierra Club	Failure to establish total maximum daily loads (TMDLs) by statutory deadline (30 days after alleged constructive submission of no TMDLs). CWA § 303(d).	EPA agreed to establish TMDLs for all water quality limited segments on Mississippi's 1996 CWA § 303(d) list by 2009 if Mississippi does not do so.	Parties to the consent order.
<i>State of Connecticut v. Browner</i> , No. 98–1376 (S.D.N.Y.).	States of Connecticut, Massachusetts, Maine, Pennsylvania, New Hampshire, New York, Rhode Island, and Vermont.	Failure to act on petitions to make finding that major sources emit or would emit prohibited pollutants by statutory deadline (60 days plus time provided by CAA § 307(d)(10) extensions, approximately 12/98). CAA § 126.	EPA agreed to a schedule to act on petitions submitted under CAA § 126.	Parties to the consent order.
<i>Tides Foundation v. EPA</i> , No. 94–2663 (D.D.C.)	Tides Foundation	Failure to propose and promulgate by statutory deadlines (proposal—4/6/92; final—10/6/94) regulations governing military munitions which are hazardous wastes. RCRA § 3004(y).	Required EPA to promulgate regulations under RCRA § 3004(y) by February 1997 identifying when military munitions are hazardous wastes and establishing standards for their transportation and storage.	Parties to the consent order (represented by the Military Toxics Project).

CONSENT ORDERS RESOLVING DEFENSIVE JUDICIAL LITIGATION BETWEEN EPA AND OTHER PARTIES—Continued

[January 1, 1989-March 31, 1999 ¹]

Case	Parties to consent order (other than EPA)	Allegations in complaint against EPA, including original statutory deadline	Description of consent order	Parties present in negotiations
<i>Ward v. Browner</i> , No. Civ. 97–1418 PHX ROS (D.Ariz.).	LaVonda Ward and Carolyn Aspegren ...	Failure to promulgate determination of attainment or non-attainment areas by statutory deadline of 6 months after 11/15/96 attainment date (i.e., 5/15/97). CAA § 107(d).	EPA agreed to a schedule regarding determination of attainment for ozone for the Phoenix, Arizona area.	Parties to the consent order.
<i>Washington Legal Foundation v. EPA</i> , No. 95–2396 (D.D.C.).	Washington Legal Foundation; Senators Craig and Nickles; Representatives Boehner, Barton, Livingston, Barr, Chenoweth, Klug, and Norwood.	Failure to submit reports to Congress on costs and benefits of CAA compliance by statutory deadlines (pre-1990 requirements—11/15/91; 1990 requirements—11/15/92). CAA § 312(d) and (e).	EPA agreed to a schedule to provide reports to Congress on costs and benefits under CAA § 312.	Parties to the consent order.
<i>Waxman v. Reilly</i> , No. 92–1320 (D.D.C.), <i>Sierra Club v. Reilly</i> , No. 92–1749 (D.D.C.).	Representative Waxman, Public Citizen, and Sierra Club.	Failure to take actions by statutory deadlines under a variety of different CAA provisions, including §§ 407(d) (5/15/92), 610(a) (11/15/91), 611(a) (5/15/92), 602(e) (11/15/91), 112(j) (5/15/92), 112(l)(2) (11/15/91), 129(a) (5/15/92), and 407(b)(1) (5/15/92).	EPA agreed to a schedule for miscellaneous actions under CAA Titles I, II, IV and VI.	Parties to the consent order.
<i>Williams v. Reilly</i> , No. 89–6265–E (D.Or.)	Kathy Williams, Citizens Interested In Bull Run, Inc., Frank Gearhart, Samuel E. Sargent, and Frances Price Cook.	Failure to promulgate regulations establishing permit application requirements for storm water discharges by statutory deadline of 2/4/89. CWA § 402(p)(4).	EPA agreed to issue final NPDES storm water (Phase I) application regulations by March, 1990 (later amended to October 31, 1990).	Parties to the consent order.
<i>Williams v. Reilly</i> , No. 90–6255–JO (D.Or.)	Kathy Williams, William Brewster, Ralph Frohwerk, and Georgia Bunn.	Failure to promulgate emission standards for hazardous air pollutants for source category by statutory deadline (4 years after the category is listed under CAA § 111(b)). CAA § 111.	EPA agreed to a schedule to issue regulations controlling air emissions from organic solvent cleaners under CAA § 112.	Parties to the consent order.

¹ Abbreviations: CAA—Clean Air Act; CWA—Clean Water Act; CERCLA—Comprehensive Environmental Response, Compensation and Liability Act (“Superfund”); TSCA—Toxic Substances Control Act; ESA—Endangered Species Act. Case numbers indicate the year in which the case was filed (e.g., a case with the number 92–1234 would have been filed in 1992).

Senator CRAIG. Would you give us an update on it?

Ms. BROWNER. On our consent decrees. Yes. Certainly.

Mr. Chairman, the vast majority of the consent decrees that we have entered into are the result of the fact that over the years EPA has missed congressionally mandated deadlines. Congress has said set a standard by X date. We miss it. We are then sued for missing it and we enter into a schedule for compliance.

I think what would be most helpful on these consent decrees, on the ones that we refer to as deadlines suits, we will also provide for you what the congressionally mandated deadline was and you will see how far off we are.

Senator CRAIG. We want a complete picture.

Senator BOND. Thank you, Madam Administrator. Senator Byrd.

NITROGEN OXIDE: STATE IMPLEMENTATION PLANS

Senator BYRD. Mr. Chairman, I have to leave shortly. Let me ask briefly a question or two with regard to the nitrogen oxide state implementation plans for 22 States in the eastern United States. Several States including West Virginia requested a 7-months stay in the deadline for the submission of state implementation plans under the NO_x SIP Call Rule to give them sufficient time to complete their regulatory processes for approval of the plans.

Since the Clean Air Act clearly contemplated the States receiving 18 months to develop and submit SIPS, why is the agency in such a hurry for the States to complete and file those SIPS?

Ms. BROWNER. There are a number of reasons. I am sure you are aware we are in litigation. The court has not yet set a briefing schedule but there has been a lawsuit filed. One of the issues that we are dealing with, just by way of example, is the fact that the Northeast states have asserted their rights under the Clean Air Act, section 126 petitions, which calls for specific reductions from specific facilities, and that is moving forward on a time frame laid out in the Act.

While we recognize their right to do that, we believe that the best way to address the ozone transport issue will not be ultimately through these petitions but rather through the SIP calls, that States will get a much better opportunity to make their own decisions in the SIP planning process than if we are forced into a situation of having to move forward with the States' petition.

Senator BYRD. Madam Administrator, I do not want to appear to be discourteous but I do have to leave. My question is not really being answered. Since the appeal of the NO_x SIP Call will likely be decided by early 2000, why not grant the States the stay in the deadline for SIP submission until after the court has acted?

Ms. BROWNER. There are a number of reasons. I tried to give you one reason, which is we have these other petitions pending that we think would limit your State's options and opportunities to make their own decisions.

We, also, have a group of States that have filed a lawsuit against us to move forward. We have existing court deadlines. When we look across all of the issues and the legal requirements and judicial requirements, we believe that a delay in the State Implementation Planning process is not beneficial and is not warranted.

Senator BYRD. Does it not make sense, though, Madam Administrator, to wait until the court has acted?

Ms. BROWNER. There are a lot of different court actions that are going to take place around this.

Senator BYRD. I did not say which court action I'm talking about—

Ms. BROWNER. But there are others, quite frankly, Senator, that I think your State would probably feel could ultimately tie their hands in making a set of State-specific decisions. We are trying to weed through this across all of the litigation and across all of the Clean Air requirements. It is not easy. These are difficult decisions.

There are tensions here, as you are well aware, between some of the other States and some of the Northeast states and some of the rights that can arise.

Senator BYRD. The electric utility industry in several States have raised concerns about the ability to comply with the very stringent NO_x reduction requirements in a very short time frame without threatening the reliability of the electrical supply in the affected and neighboring states. The North American Electric Reliability Council is preparing a comprehensive report to assess this issue. If it should determine that the compliance deadline imposes a certain threat to the reliability of electricity, will the EPA be willing to extend the compliance deadline to alleviate this problem?

Ms. BROWNER. We spent a great deal of time discussing with trade associations in various States this issue prior to—

Senator BYRD. Is the answer not yes or no to my question?

Ms. BROWNER. We did it in the SIP call. That is the answer.

Senator BYRD. Then the answer is yes?

Ms. BROWNER. Yes. We have done it in the SIP Call. We gave the state the right to move deadlines for individual facilities if they felt there would be an interruption in electrical service. Your State got that in the SIP call. In fact, your State was very vocal in arguing for that. We provided reliability and flexibility, what they wanted, 200,000 tons extra to the States for precisely this reason. It is in the SIP Call now.

Senator BYRD. Would you examine the cumulative effect of your regulations instead of looking at the EPA regulations on a case-by-case basis? States like West Virginia are suffering death by a thousand cuts instead of a single blow. Could you do that?

Ms. BROWNER. Yes. We are certainly willing to work with West Virginia to do that.

Senator BYRD. What did you say?

Ms. BROWNER. I said we would be more than happy to work with West Virginia to do that. Yes.

Senator BYRD. Mr. Chairman, I have some other questions. But, I take it, you will not be in session this afternoon.

Senator BOND. We hope to finish this up in time for lunch. I have a number of questions on the NO_x and SIP Call myself. There will be significant questions submitted for the record.

Senator BYRD. Very well. I'll submit mine for the record. Thank you, Madam Administrator.

Ms. BROWNER. Thank you.

Senator BOND. Thank you very much, Senator Byrd, for your participation, and my staff and I will look forward to working with your staff on a number of these issues you have raised.

Turning back to Senator Craig for questions.

SF: COEUR D'ALENE

Senator CRAIG. Thank you very much, Mr. Chairman.

Director Browner, another set of questions on a different issue, and some of them you may not be able to respond to now and we will submit them so that we can get a complete set of answers for the record.

As you know, in the north end of my State I have one of the largest Superfund sites geographically in the country, a 21-mile square Superfund site in the greater Coeur d'Alene Basin and it is what is known as the Silver Valley, an old lead and zinc and silver mining region of our State that has been gone now for well over a century.

We are extremely frustrated in the region by an inability to shape and to bring to some definitive conclusion where we go. As you know, some years ago a natural resource damages suit was filed by the Justice Department on behalf of Interior and Native Americans as it relates to the region and that has, of course, complicated the process. But I think the thing that frustrates all of us most is a concern that outside the 21-mile zone, we have seen EPA's presence in an ever-increasing way, as their scientists comb the region to try to find impacts outside the Superfund site.

In fact, there is great concern there that EPA might propose an expanded Superfund site that would be almost unbelievable regionally. Now in latter days there has been a backing away from that and I am very pleased about that. But what concerns me most is when we did deal with the remediation and investigation feasibility studies, we have seen lots of money spent and no gold nuggets found. Kootenai City, Idaho attracts worldwide recreation. EPA is out on the beaches and testing the water and implying, at least in the short term, that this may not be a safe area to be in, even though the beaches were found safe. Kids swim in the water. Fish promulgate in the water and Mother Nature is doing a reasonably good job of cleaning it up. I guess my question to you is how much money has been spent on RFI studies outside the existing Superfund sites? Do you have that figure?

Ms. BROWNER. There has not been a Superfund designation at this time. We are working, in fact, I had a meeting with your Governor just last week. Our regional administrator met with the Governor and we are fully committed to finding consensus on how to deal with any listings. But there is—

Senator CRAIG. That was not my question. My question was could you to date or could you provide to me the amount of money EPA has spent in these remedial investigation feasibility studies outside the site?

Ms. BROWNER. There is no site.

Senator CRAIG. No. EPA is all over the Coeur d'Alene area and the Spokane area.

Ms. BROWNER. Maybe we can provide the information for the entire State.

Senator CRAIG. No. I want it to be provided for the Coeur d'Alene Basin region. That spills across State boundaries into the Spokane valley. That would be extremely helpful. Do you know how much more is anticipated in relation to the scientific efforts going on and what that would be?

Ms. BROWNER. We will provide that for you. I do know that on April 22 there were two separate meetings held to discuss results of the ecological sampling. There are more meetings planned and we have indicated that we will adjust the time frames to incorporate the public participation.

[The information follows:]

COEUR D'ALENE BASIN

EPA estimates that as of May 2, 1999, approximately \$10,200,000 in cost associated with work in the Basin, including the RI/FS and the costs associated with litigation. In addition, EPA has incurred \$750,000 conducting residential and school soil removals outside of the existing 21 square mile Superfund site.

These costs are estimates and have not been reconciled by EPA finance personnel. All site costs are reconciled as part of the cost recovery process which occurs when the sites reach completion.

EPA estimates spending an additional \$6.1 million in fiscal year 1999 and approximately \$8.8 million in fiscal year 2000 to complete the RI/FS for the Basin. These costs are estimates; actual cost will be dependent upon factors that are unknown at this time, such as the nature and extent of contamination found, the need for treatability studies, and input from a large number of stakeholders involved in the Basin.

Senator CRAIG. In those time frames, how long do you think it will take EPA to finalize this? And it now looks like 2001 may be the case, with cost upwards to \$17 million. Do we know that to be the case?

Ms. BROWNER. I do not know that to be the case. What I would like to do, if this would be helpful to you, is ask Chuck Clark who met with your Governor to actually call you and discuss the outcome of that meeting and the specific commitments in terms of how we will proceed.

Senator CRAIG. Carol, that region is very intent on getting cleaned up and getting this passed them. They have been intent on that for a decade. And I must say you have not been at the helm for EPA a decade but EPA has not been acting in a contributing manner toward timeliness. I would say in all credibility it has been getting better and we are going to put enough heat on you that it gets a lot better a lot quicker.

Ms. BROWNER. I think the intention on this side is to make sure that those areas that may need cleanup remediation, that we manage it in such a way that other areas are not affected. I think that has proven to be more difficult than anyone thought. The easy way to proceed and perhaps the way the Agency proceeded historically was to draw a big line around everything as opposed to just taking the isolated areas. I know that is what we all want.

Senator CRAIG. The U.S. Geological Survey has been there and we can tell you where the hot spots are. There have been major effort on the part of the States and the interested parties and they have probably done more for cleanup—Mother Nature is doing a pretty good job in cooperation with these hot spot cleanups and all that kind of thing. I think that is our frustration.

As you know, when EPA casts its net, it also creates a cloud and that cloud can impact economic activity and it can also impact the future opportunities in a region that is extremely beautiful. And if anyone drives there, they think it has got to be one of the beauty spots of the Western world. We say EPA is scouring on the beach to see if there is a problem and that is an impact that is very negative. That is why timeliness is important here.

Ms. BROWNER. Okay.

Senator CRAIG. I am pleased with your sensitivity to it. It is something that deserves to be dealt with in a timely fashion. I have a number of other questions and I will submit those for the record.

INFORMATION MANAGEMENT OFFICE

Senator BOND. Thank you very much for your questions and thank you for your participation on this subcommittee.

We have many, many very important areas and we are very grateful when the subcommittee members will take part and help us in pursuing the knowledge and the information that we need to craft a bill.

Let me turn now to a very exciting topic, one that always captures headlines. It is information management. And if everybody will bear with us. This is important.

The committee expressed last year the need for an office of information management. As you and I discussed yesterday, I would like to note for the record, when will this office be fully operational? When will we have someone in charge? Will this individual be fully accountable for the quality and integrity of all EPA data that is released?

Ms. BROWNER. By the end of summer it will be operational. And, yes, that person will be fully accountable. Per our discussion in your office earlier this week, we have provided an organizational chart.

[The information follows:]

STRUCTURAL FRAMEWORK FOR EPA'S NEW INFORMATION OFFICE

Ms. BROWNER. I think what you will see that we are taking the issues of both collection, management, quality assurance and dissemination very, very seriously.

You see there is a quality board and quality staff that answer directly to—

Senator BOND. I guess, the question is you've got this person in the middle of it there.

Ms. BROWNER. On top.

Senator BOND. How is this person going to exercise the discipline over all of the different lines of authority within EPA?

Ms. BROWNER. Since the actual programs that collect the data are getting moved into this office, for example, a program that traditionally sat in the Office of Toxic Release Inventory is getting moved into this office and they will answer to this person.

Senator BOND. And you pointed out the move would not initially include all of them. But the most important ones that have multi-program application would be moved in.

Ms. BROWNER. Correct.

Senator BOND. So they would actually be reporting to this national program manager, not the old division or department directly?

Ms. BROWNER. Correct.

Senator BOND. By the end of September this will be in operation. Have you developed the plan for how this office will operate, the goals and other objectives, the management priorities and what resources are needed? Do you have that information available?

Ms. BROWNER. Yes. We can provide that for the record. What we are doing is a broad outreach to parties who will make use of this office, to parties who will be responsible for providing information

to this office in terms of how to go into all of the details of creating this office.

We do have a general mission statement and a basic design premise that we have developed. We have been working to refine it with parties both inside the agency and outside the Agency such as industries, the states, and the public.

There is, for example, the data quality—
[The information follows:]

EPA'S NEW INFORMATION OFFICE

THE NEED FOR CHANGE

External Drivers

- Rapid Technology Development
- Greater Demand for Environmental Information
- Concerns about Data Quality and Security
- Concerns about Reporting Burden
- GPRA

Internal Responses

- REI Action Plan
- Data Quality Action Plan
- Center for Environmental Information and Statistics Strategies
- Goal 7 of EPA's Strategic Plan

DEVELOPMENTS TO DATE

Comprehensive Information Management Force.—recommends organization to oversee information management and policy (Aug–Sept 1998)

Information Working Group.—recommended a structural framework for the new Information Office (Oct–Dec 1998)

Information Transition and Organizational Planning.—established framework and early action projects, will launch new office this summer (Jan–Aug 1999)

WHO'S INVOLVED

Leadership Team

- David Gardiner
- Margaret Schneider
- Al Pesachowitz

ITOP

- Kathy Petrucci, Director
- Temporary team of about 25 staff

Active Inreach and Outreach

- EPA programs and regions
- State partners
- Other external groups

OUR ASPIRATIONS

Vision.—a center of excellence that advances use of integrated multi-media information:

- as a strategic resource for decisionmakers, and
- to satisfy the public's right-to-know

Mission.—provide leadership in creating information policies and mechanisms that enable:

- efficiency,
- effectiveness,
- quality, and
- usability of information throughout EPA

OUR KEY GOALS

Provide:

- Information Integration
- Information Quality

- Burden Reduction
- Right-to-know
- Through:
 - A strong Leadership and Policy Framework
 - Enhanced State Partnership
 - Sound Information Infrastructure
- For information-based decisionmaking by all.

PROGRAMS COMING INTO THE NEW OFFICE

OIRM	Regulatory Info. Div.
TRI	Surf Your Watershed
CEIS	National Computer Center
EMPACT	LAN/e-mail
EMMC	IRM ESC
ECOS/EPA Envir. Info. Mgmt WG	Centralized Dockets
One Stop Program	Spatial Data/MultiResolution Land
EPA QA Program	Characterization

EARLY ACTION PROJECTS

New Projects

- Information Plan
- Public Access Policies
- Open Data Access

Important Work Underway

- REI
- Data Quality Action Plan
- Burden Reduction
- Enhanced Public Access
- Streamlining TRI Data Collection and Release
- Systems Modernization

KEY ISSUES

Cross-Agency Support
 Collaborative Partnerships with States
 “Respectful Use” of Information
 Information Security
 Balancing Burden Reduction and Data Gaps
 Data Quality

BUDGET STATUS

Currently defining a process to identify functions and resources moving to the new Office while simultaneously defining roles, responsibilities and needs.

- Fiscal year 1999: Approximately 350–400 FTE; Approximately \$45–55M extra-mural
- Fiscal year 2000: Internal adjustments via Operating Plan
- Fiscal year 2001: Develop needs through Goal 7 and 10 process

TIMELINE

April

- Resolve “gray areas” for inclusion in new Office
- Define new Office functions

May

- Design new Office substructure
- Develop process for selecting managers and staff

June

- Select managers
- Develop fiscal year 2001 budget

July

- Select staff

August

- Resolve all administrative, organizational, and logistical details

- Complete internal review of full reorganization proposal
- Complete Union review of reorganization
- Complete reorganization by Labor Day

MISSOURI LAWSUITS

Senator BOND. Because it is important, we want to make sure that you focus on that.

There are many other questions that we will be submitting for the record. But let me ask, the authority to file lawsuits is provided in many of our environmental statutes, especially clean air. Can you give me any reason that I can share with my Missouri constituents why Missouri has become such a particular focus for some of these lawsuits? What is it in Missouri that attracts lawsuits? There are some areas that attract tornadoes. What is about Missouri that attracts lawsuits?

Ms. BROWNER. The good news is we are all on the same side.

Senator BOND. Do you know what it is?

Ms. BROWNER. We will look at that. You do have one that has attracted a lot of attention. But there, I think, you and the Agency and the State are all of common mind. We think we did something very reasonable in terms of providing the State some relief that they sought and not affecting the public's air quality.

Unfortunately, there was an organization out there who did not agree with us. We are in lockstep with the State in defending against the lawsuit.

[The information follows:]

AIR QUALITY LAWSUITS: MISSOURI

Missouri has been the subject of Clean Air Act litigation for a few reasons. First, EPA did not meet the statute's requirements for the Agency to determine whether the St. Louis moderate ozone nonattainment area had attained the 1-hour ozone standard by the area's attainment date and, if the area had not, to reclassify it from moderate status to a serious or higher classification under the Act's provisions for implementing the 1-hour standard. In addition, the plaintiffs allege that EPA has failed to meet a duty to promulgate federal implementation plans for the St. Louis area due to the lack of approved state implementation plan provisions satisfying various Clean Air Act requirements. It should be noted that this litigation also affects Illinois since the St. Louis ozone nonattainment area includes a portion of Illinois, as well as Missouri. Moreover, other states have been the subject of similar litigation (e.g., Phoenix, Arizona was the subject of litigation concerning EPA's failure to determine whether it had attained the 1-hour ozone standard and various cities in the east such as Baltimore, Philadelphia and New York have been the subject of litigation concerning EPA's alleged failure to promulgate federal implementation plans).

Other citizen suits have been brought against EPA which affect Missouri's environmental programs. For example, there are two pending lawsuits in which the plaintiffs are seeking a court order to require EPA to develop total maximum daily loads (TMDLs) for waters in Missouri. *American Canoe Association v. EPA*, No. 98-1195 (W.D. Mo.) and *Missouri Soybean Association v. EPA*, No. 98-4282 CV-C-5 (W.D. Mo.). However, lawsuits of this nature are not unusual. For example, citizens groups have filed TMDL lawsuits similar to the one in Missouri in 28 states.

Senator BOND. Madam Administrator, we are going to move on. Let me close. This is going to be Senator Craig's—he said he needed an opportunity to ask a question. I would say, just to follow up on that, Missouri is not in compliance yet. Is that one of the reasons there is a lawsuit? Are we on the way? Is this a problem?

Ms. BROWNER. We have enjoyed a very good relationship with your Governor and others in your State in addressing difficult air pollution challenges. We appreciate their creativity and willingness

to work with us. You have a plan and are moving forward. We will go and look at how many lawsuits have been filed around Missouri. There are probably many more in my home state of Florida.

COMPLIANCE ASSISTANCE ACTIVITIES

Senator BOND. I would note that EPA is only requesting \$19 million for compliance assistance activities, a reduction. But in your budget you state that you think the States will assume the majority of the work.

I question whether it would be wasteful for 50 States to develop compliance tools, and EPA has indicated how successful those programs are, and we would like to have for the record your assessment of the effectiveness of these programs.

Ms. BROWNER. Within compliance, there are a number of different programs. The nine compliance centers we think, have been hugely successful. We are not cutting those. There are some non-agency training programs that we have not sought funding for.

Senator BOND. We were just looking at the compliance assistance and grants line. My staff will get back to you on that.

[The information follows:]

COMPLIANCE ASSISTANCE: EFFECTIVENESS OF PROGRAMS

EPA's role has been and continues to be to develop and distribute compliance assistance information and tools for business and industry. As the primary providers of direct assistance to the regulated community, states and localities and other compliance assistance providers use or adapt EPA compliance assistance materials to reflect specific state or local requirements. We believe this relationship has been very successful in improving the regulated community's awareness and understanding of its environmental obligations. We intend to expand these outreach efforts by working more closely with compliance assistance providers, especially with state and local governments.

Participants at our recent conferences on EPA's compliance programs confirmed the value of EPA's compliance assistance tools and materials and urged us to continue developing general compliance assistance tools that are widely applicable and that are made widely available through the Internet, toll-free hot lines and other appropriate channels. We also heard strong support for the view that states are the first-line, on-site purveyors of compliance assistance. EPA continues to work with the states and other assistance providers to develop a strong network to exchange information and tools and minimize duplicate services.

We believe that our compliance assistance tools have increased the regulated community's understanding of environmental requirements. For example, working with industry associations and other organizations, we have set up nine Compliance Assistance Centers through Internet web sites, toll-free telephone lines, and fax mail, each directed toward a specific industry or government sector. During 1998, the five existing Compliance Assistance Centers logged over 190,000 user sessions and responded to over 3,600 toll free phone calls and questions via e-mail. In addition to the Centers usage, EPA Regional offices in fiscal year 1998 collectively reached almost 250,000 regulated entities through compliance assistance outreach mechanisms including telephone hotlines, workshops and training sessions, on-site visits and compliance assistance tools. Notable examples of these tools include the 28 sector notebooks, which are industry sector profiles containing information on the overall compliance history, applicable federal requirements, industrial processes, pollutants generated, pollution prevention approaches, and cooperative programs designed to improve the environmental performance of the industry. Since 1995, over 300,000 copies have been distributed in printed and electronic form. Moreover, eighteen plain language guides and several compliance checklists have been prepared for selected sectors, including the food processors, paints and coatings, and automotive sectors.

In addition to the development of compliance assistance materials, EPA regions and states have undertaken sector-based compliance assistance projects in partnership with industry. For example, EPA, Virginia, Maryland, the District of Columbia, and the Korean Dry Cleaners Association of Greater Washington developed a men-

toring program where experienced dry cleaners trained by EPA and the states helped less-sophisticated dry cleaners understand and comply with environmental requirements. The compliance rate of participants was estimated to be 20 percent higher than other area dry cleaners. EPA will continue these types of partnerships to increase environmental compliance.

ADDITIONAL COMMITTEE QUESTIONS

Senator BOND. Thank you very much, Madam Administrator.

[The following questions were not asked at the hearing, but were submitted to the Agency for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR BOND

GRANTS OVERSIGHT OF ASSISTANCE AGREEMENT: POST AWARD MANAGEMENT

Question. How would these reviews enable EP grants management staff to ensure individual grant recipients did not charge the Federal government unallowable costs such as litigation expenses?

Answer. The main purpose of post-award management review is to provide a general overall evaluation and discussion of the recipient's financial, procurement, property management, and general and administrative systems. To ensure the grantees system are working, we do some transactional testing on a select sample basis, looking for unallowable costs such as litigation and other expenses.

However, these are not audits, because only the Office of the Inspector General (OIG or IG) or Certified Public Accountant (CPA) can perform audits. Post Award Management reviews are limited in scope and range from 1.5 to three days on-site.

Question. Do the monitoring strategies required under the Tier I Baseline Monitoring component of the Policy enable EPA grants management staff to ensure individual grant recipients did not charge the Federal government unallowable costs such as litigation expenses?

Answer. Tier I monitoring is geared toward proactive and preventive monitoring, such as continual contact and communication with the project officers and recipients to ensure the grants are progressing satisfactorily and to respond to any problems or concerns. If the recipient or project officer has a concern or question about allowability of any activity or purchase under the grant, the Grants Management staff will address those questions in accordance with the grant agreement and administrative rules and regulations, or as necessary, obtain or provide the appropriate guidance or direction.

Question. How many financial audits did grants management staff perform on non-construction grants to non-profits (grants) in fiscal year 1999 to ensure individual grant recipients did not charge the Federal government unallowable cost such as litigation expenses? What percentage does this represent of the fiscal year 1999 total number of grants?

Answer. Financial audits are audits performed by staff in the OIG or by CPA firms under either the Single Audit Act or the IG Act. Grant staff are not permitted to perform financial audits. However, we do perform post-award management review monitoring and other grantee outreach activities as noted in response #1.

During fiscal year 1999, grants management staff performed 638 outreach activities to recipient type organizations through training and outreach, technical assistance onsite reviews, evaluative on-site reviews (e.g. general evaluation of grantee financial management systems, cost sharing, source documentation, subawards, property management, travel, payroll, and cost allocability and allowability), etc. This represents approximately 16 percent of the fiscal year 1999 total number of active awards. However, with emphasis on Post Award, the percentage is 6.2 percent of total active awards.

Moreover, to date in fiscal year 1999, we have performed Post Award Outreach (including Evaluative and Technical Assistance on-site visits, desk reviews, and management assistance forums) at approximately 16.5 percent of our "recipient organizations". This percentage does not include Pre-award workshops, training, and outreach.

Question. Did any of these financial audits obtain general ledger—summary of transactions, transaction details, originating documents or other materials to ensure individual grant recipients did not charge the Federal government unallowable costs such as litigation expense?

Answer. Again, we do not perform financial audits. However, our post award management reviews frequently involve a review of the general and or subsidiary ledgers from which to judgementsally select samples for transaction testing purposes.

Within the tests of transactions we obtained supporting details through supporting documentation, discussions, and observations. We also, performed traces to originating documents looking at original authorizing signatures, approval dates, and need for the transaction. During each visit the four major areas (i.e., financial, procurement, property management, and general and administrative) are addressed, however, the detailed focus of our review may vary to some degree based upon identified problem areas.

Question. As of April 29, 1999, how many of EPA's Grants Management Offices (GMOs) have fully implemented the policy and which GMOs have not, if any?

Answer. As of April 29, 1999, all Grants Management Offices (GMOs) have begun to implement the Post Award policy. With the exception of one GMO, these offices are complete or nearly complete in their implementation of the policy. The GMO in Region X will benefit from a national conference this month when officials and representatives from each GMO will discuss the policy's implementation in each of their regions and Headquarters. While we are happy to report that most of our offices are at or near full implementation, the facet of 'full implementation' extends out to December, 1999 in accordance with the Post Award policy.

Question. How many GMOs have developed a Monitoring Plan to monitor their post-award management activities and which GMOs have not, if any?

Answer. All but two GMOs have developed a Post Award Monitoring Plan. The GMO in Region VII is well underway in implementing the Post Award Monitoring policy but is in the midst of completing its Monitoring Plan. Region X will develop a plan in June, 1999.

GRANTS: OVERSIGHT OF ASSISTANCE AGREEMENT—MATERIAL WEAKNESSES CORRECTION

Question. When the Administrator first declared oversight of assistance agreements a Material Weakness in 1996 under the Federal Managers' Financial Integrity Act, the Agency targeted 1998 as the target correction date for this Weakness. The Agency has pushed back on the correction date by an additional year in each successive Integrity Act Report and the correction date is now 2000. What is the reason for these multiple extensions of the correction deadline?

Answer. The Agency did consider moving up this target date since the closeout of non construction grants was progressing satisfactorily. However, Agency decision makers wanted to ensure that all programs and Regions had developed post award plans prior to eliminating this as a material weakness. Post Award Plans are being developed and implemented, and the Agency has closed out 95 percent of its original non construction grant backlog.

Question. A major corrective action milestone to address EPA's grants management material weakness calls for the issuance of a policy on Project Officer roles with emphasis on post award administration. The original target date for completion of this milestone was December 1997, the current target date is December 1998 and yet the fiscal year 1998 Integrity Act Report states the Agency has not completed this milestone. What is the reason for delay in completing this milestone and when will the Agency achieve this milestone?

Answer. The Grants Office has worked closely with the program offices and regions to develop the policy for post award management by Headquarters and Regional Offices; the policy was signed on April 5, 1999. The final policy is a companion to the Grant Management Officer's post award policy. It requires each headquarters and regional office to develop and implement a post award plan. It will ensure management accountability and allows offices to tailor their post award efforts to their particular grant programs and grantees. The Plans will be reviewed by the Office of Grants and Debarment and will ensure coordination between grants specialists and project officers. The final policy is broader than originally envisioned and will support better grants management in the Agency.

Question. The Agency, as part of its strategy to address its material weakness in grants management, conducted a study to realign the Grants Operations Branch to allow more time for post award administration. The Agency set December 1998 as the target date to implement the recommendations from the realignment study and yet the Agency states in the fiscal year 1998 Integrity Act Report that EPA has not accomplished this milestone. What are the recommendations and what progress has EPA made in implementing these recommendations?

Answer. The Grants Operations Branch realignment study resulted in various recommendations to allow more time for post-award administration. These recommendations addressed issues such as automation improvement, workload distribution, and staff training. Each of the recommendations under this study have been considered and were implemented, as feasible. The remaining recommendations are automation-related. The automation-related recommendations have been

incorporated into the development of the Integrated Grants Management System (IGMS) which will eventually automate the programmatic and administrative grant process from guidance development, application, negotiations, award to closeout.

The implementation of these recommendations has allowed the headquarters staff more time for conducting post-award administration activities such as baseline monitoring activities, site visits, and other outreach activities.

Question. The Agency has requested each Region and program office conduct Management Effectiveness Reviews (MERs) concerning oversight of assistance agreements. What will these reviews enable the Agency to determine and will they enable EPA grants officers to ensure individual grant recipients are not charging the Federal government unallowable costs such as litigation expenses? If so, how many MERs did the Agency conduct in fiscal year 1999 and how many does EPA expect to conduct in fiscal year 2000?

Answer. The Office of Grants and Debarment (OGD) is the national program manager for grants management in the Agency. Management Effectiveness Reviews (MER) are self-assessments by each Agency office and Region on how they manage their grant programs. OGD develops protocols, provides guidance, ensures the MERs are completed and corrective actions are conducted by program and regional offices. In addition, OGD consolidates the results of the MERs and works with all of the regions and program offices to identify needed training, policies, etc. These results are considered and incorporated in the final assurance letter to Congress.

MERs are conducted every two years by the offices. OGD works with the program and regional offices on a regular basis to ensure progress is being made on corrective actions identified during the MER. Since these reviews focus on internal systems, the review of unallowable costs by a particular grantee would not be part of the MER process. As part of the fiscal year 1999 MER, program and regional offices are being asked to evaluate the effectiveness of their post award management plans and implementation.

During fiscal year 1999, the Agency will complete 22 MERs. The MERs are conducted every two years. OGD ensures program and regional offices address corrective actions. The next round will occur in fiscal year 2001.

The Agency will use the Management Oversight Reviews (MORs) to measure the results of its progress to eliminate the grants management material weakness. What will these reviews enable the Agency to determine and will they enable EPA grants officers to ensure individual grant recipients are not charging the Federal government unallowable costs such as litigation expenses? If so, how? How many MORs did the Agency conduct in fiscal year 1999 and how many does EPA expect to conduct in fiscal year 2000?

OGD is the national program manager for grants management. In assuring the quality of these operations nationwide, OGD conducts oversight reviews (MOR) of its GMOs regularly. The MORs are part of the Office's quality assurance function and include a rigorous review of how the grants office operate. The MOR protocols review compliance with EPA statutes, grant regulations and policies. A select number of grant files are reviewed to ensure quality in the GMO's review and award of grants. Categories of cost are identified during the pre-award phase as part of the applicant's budget. The review team searches these documents and ensures GMO staff are performing satisfactory reviews of the applicants' budgets. (Expenditure reports from the recipient to EPA such as financial status reports merely identify aggregated expenditures in accordance with Federal regulations.) Specific concerns unique to the particular GMO are addressed during the MOR.

Each MOR Team is comprised of four individuals including Headquarters Policy staff as the lead and grant specialists from Headquarters and other regional GMO staff. The MOR team also interviews regional program office staff about grants management in the region.

We performed three MORs during fiscal year 1999, and we anticipate performing three in fiscal year 2000. We plan to perform three each year so each GMO is reviewed every three to four years.

Question. A 1995 Inspector General audit examining recurring problems in EPA grants management found EPA project officers and grant specialists did not review Financial Status Reports (FSR) and many grant files did not contain FSRs. Do FSRs enable EPA grants officers to ensure individual grant recipients are not charging the Federal government unallowable costs such as litigation expenses? If so, how? For what percentage of grants in fiscal year 1999 did EPA project officers and grants specialist review FSRs and how does EPA know and measure this fact?

Answer. Financial Status Reports (FSR), standardized government-wide forms, identify expenditures in aggregated amounts. There is no break-out of costs or expenditures by category type, nor is there a break down by product, item, or service purchased. Therefore, EPA staff cannot use FSRs to identify unallowable costs. Gov-

ernment-wide regulations prohibit requesting detailed financial information beyond what is authorized in OMB circulars.

Through May 1999, EPA has reviewed and approved a minimum of 3,400 final Financial Status Reports. The approval of these reports was necessary to the closeout of these grants. These reviews are documented in the Agency's grant closeout process and reported in the Grants Information Control System.

Government-wide OMB circulars provide the option of utilizing 'Reports of Federal Cash Transactions' or 'Requests for Advance or Reimbursement' if it is determined this information provides more timely financial information than an interim FSR. EPA requires these reports on a quarterly basis for all grantees who receive electronic payments (approximately 85 percent of all non construction grantees).

Other mechanisms are available to monitor the financial status of a grant project. Project officers and grant specialists can monitor the amount drawn down under the grant from the Agency's financial system. Monitoring drawdowns from the financial management system during the life of the grants ensures more timely stewardship of federal funds.

Question. The same IG audit found EPA was not obtaining single audit reports from grant recipients. What information does the single audit reports provide EPA project officers and grant specialists? Does the financial statement audit enable EPA grants officers to ensure individual grant recipients are not charging the Federal government unallowable costs such as litigation expenses? If so, how? For what percentage of grants in fiscal year 1999 did EPA project officers and grants specialists obtain and review FSRs and how does EPA know and measure this fact?

Answer. Under single audit there is a concept of major and non-major programs. For a major program, the auditor provides an opinion on compliance with Federal laws, regulations and provisions of contracts or grant agreements that may have a direct and material effect on each major program.

The single audit provides no specific audit coverage of non-major programs. Major programs are selected at each individual grantee using a risk-based approach. Using the risk-based approach, an auditor looks at not only the dollar value of a program, but also the risk that a grantee has not complied with program requirements, based on current and prior audit experience, the extent of federal agency and pass-through entity oversight, and any inherent risk of non-compliance in a federal program.

Question. For what percentage of grants do EPA project officers and grants specialists review FSRs and how does EPA know and measure this fact?

Answer. EPA staff review FSRs as they are received. This fact is monitored in EPA's Grants Information and Control System (GICS). The date of final FSR receipt is recorded in GICS. The final FSR is one of several items required to close out a grant. The GICS will be updated to reflect the date the grant is actually closed. While this measurement is combined with other actions required for grant closeout, EPA knows from this data that the FSRs are being reviewed and approved. EPA has closed out 95 percent of its awards.

GRANTS: OVERSIGHT OF ASSISTANCE AGREEMENTS—POST AWARD MANAGEMENT

Question. EPA's fiscal year 2000 Annual Performance Plan includes a single performance goal for Grants Management. The two parts of that goal consist of eliminating the closeout backlog for non-construction grants and increasing the number of Grants Management Offices awarding grants through the Integrated Grants Management System.

How does eliminating the closeout backlog for non-construction grants address the oversight concerns of thoroughly reviewing grant applications, performing site visits, reviewing project status reports, obtaining single audit reports, providing final project certifications, or enabling EPA grants officers to ensure individual recipients are not charging the Federal government unallowable costs such as litigation expenses?

How will "utilizing electronic commerce to fully automate the assistance process from cradle to grave," as hoped for in the fiscal year 2000 Annual Performance Plan, address the oversight concerns of thoroughly reviewing grant applications, performing site visits, reviewing project status reports, obtaining single audit reports, providing final project certifications or enabling EPA grants officers to ensure individual grant recipients are not charging the Federal government unallowable costs such as litigation expenses?

Answer. Several years ago, the Agency began efforts on a major reinvention effort—the Integrated Grants Management System. This is programmatic and administrative electronic grant system. We are currently piloting the initial stages of the system with five pilot regions and states. This system will give the Agency the framework to track and document all of our work in the areas of pre-application,

award, post award and closeout. The system will ensure greater consistency and standardization nationwide and will enhance communication with grantees and across EPA. The system will have links to other intergovernmental systems such as the Single Audit Clearinghouse. In addition, project officers and grant specialists will be able to monitor requirements of the grant, receive copies of reports from the grantee and document site visits.

The Agency has made significant progress in addressing their non construction grant closeout backlog. Closeout policies have been reviewed and updated; all grants management offices have developed strategies to identify barriers to closeout and how they are addressing those barriers. As a result, as of the end of May, the Agency had closed 95 percent of its original closeout backlog. In addition, the Agency is piloting automation tools so that project officers and grant specialists can speed up closeout of grants. To closeout a grant, the Agency must review and approve the final Financial Status Report, all dollars on the grant are either deobligated or expended by the grantee, and all deliverables are certified complete by the project officer.

EPA also continues to participate with other federal agencies on US E grants and Federal Commons. The Agency believes that all of these systems will help us to save time on processing so that we can focus our efforts on the monitoring of grants and grantees.

The Agency has taken numerous actions which addresses the oversight and monitoring concerns related to grants management. The Agency has strengthened the training provided to program office staff, placing greater emphasis on post award management, and has implemented a refresher course which addresses new grants management issues. EPA also provides information on its website and automating tools which enhances post award monitoring. The website also provides information on Grants policies and procedures. The Agency has also increased the training provided to our Grants Specialist. Examples of the type of training received by the Agency's Grants Specialist includes: post award monitoring activities, fraud awareness, OMB Cost Principles, cost analysis, and Appropriation Law training.

In addition to training, the Agency is conducting various post award monitoring activities of grant recipients which include on-site evaluative visits, on-site technical assistance, technical assistance conferences and workshops, and desk reviews. On a biennial basis, all regional and headquarters program offices conduct a management effectiveness review of their assistance activities to identify potential vulnerabilities and areas for improvements.

Question. The fiscal year 2000 Annual Performance Plan states the Agency included \$8,568,800 for the Grants Management Key Program in its fiscal year 1999 Enacted Operating Plan and \$9,679,900 in the fiscal year 1999 President's Budget request. What level of resources did the Agency devote to this Key Program or equivalent set of activities in its fiscal year 1998 Enacted Operating Plan?

Answer. The total dollars for the Office of Grants and Debarment in fiscal year 1998 was \$7.5 million.

Question. How many financial auditors were employed by EPA grants organizations (excluding the IG) in fiscal year 1999?

Answer. Financial auditors (GS-511) within EPA are employed primarily by EPA's Office of the Inspector General.

Question. How must a non-profit group document its non-profit status before obtaining a grant from EPA?

Answer. A non-profit group documents its non-profit status by indicating its status in block #7 of its signed application form (SF-424). The grants management staff also checks the Cumulative List of Organizations (described in Section 170(c) of the Internal Revenue Code) known as "the Blue Book" and Supplement. If the applicant organization is listed in these documents, EPA may award the organization a grant. If the applicant organization is not listed in the Blue Book, the Grant Specialist will contact the recipient for further information and necessary documentation. If it is determined the organization is a non-profit organized under 401(c)(4), the Agency will not make the award. The Grants Specialist also checks the application for the organization's Anti-Lobbying certifications which will also indicate the organization's status. The Lobbying Certifications will indicate whether the organization lobbies, and if so, certify that lobbying is not paid for with Federal funds.

EPA REVIEW OF TRANSPORTATION PROJECTS

Question. In a speech delivered in February to a group of developers in Boston, Region I Regional Administrator John DeVillars noted the Agency's 'unwavering commitment to use the full force of environmental law to oppose or seek modifica-

tion of those projects which—by their very nature—contribute to sprawl.’ Was DeVillars speaking for the Agency when he described this ‘unwavering commitment’?

Answer. Mr. DeVillars’ comments reflect the Agency’s commitment to address one of the most serious environmental issues this country is facing: the deterioration of air and water quality caused by traffic growth and nonpoint source pollution. Using the authorities and funding that Congress has provided to EPA and the states, we have made significant improvements in air and water quality that are attributable to controls on point sources of pollution; however, total increases in vehicle miles traveled and nonpoint source water pollution are threatening to undermine this progress. For example, we are driving our cars almost 60 percent more than in 1980 and although car emissions have gotten cleaner, EPA estimates that the pollutants emitted by this increase in driving will, in 10 to 12 years, reduce the gains we have made in recent years in reducing air pollution, unless technology keeps pace. EPA does not have—nor ever will—the authority to control the number of vehicle miles traveled in this country. But EPA is committed to working in partnership with the Department of Transportation and others to offer people transportation choices that are less polluting, in order to meet our Congressional mandates to protect the quality of our air and water. Similarly, over half of our water pollution nationwide is now due to nonpoint sources, such as runoff from roadways and parking lots. As Mr. DeVillars stated, EPA will use existing regulatory authorities in the Clean Air Act, Clean Water Act, and National Environmental Policy Act to carry out our statutory obligations to ensure that projects are designed in such a way as to minimize adverse environmental effects of sprawling patterns of development. Finally, EPA also will work to ensure that none of our programs or policies are inadvertently encouraging sprawl or the decay of our urban centers.

Question. Which transportation projects has EPA opposed in the last five years?

Answer. One of the authorities that EPA uses to review transportation projects is Section 309 of the Clean Air Act. Under this section, EPA has the responsibility to comment on the potential impacts of federal actions to public health or welfare, or environmental quality. One of the significant ways in which EPA carries out that responsibility is to review and comment on Environmental Impact Statements (EIS) published by the other federal agencies in accordance with the National Environmental Policy Act (NEPA). In order to carry out EPA’s responsibility in a consistent manner, EPA developed and uses a rating system to rate draft and draft supplemental EIS. This system rates a document both on its potential impacts as well as the adequacy of the documentation itself. The adequacy of the document is reviewed to see if the agency disclosed all significant potential environmental impacts to the public and the decision-maker well enough to make an informed decision. With the exception of extraordinary circumstances, EPA limits its ability to refer proposed actions to the Council on Environmental Quality (CEQ), the agency which oversees implementation of the NEPA, to EISs which have received the most stringent EPA ratings of either environmentally unsatisfactory or inadequate information or both.

For illustrative purposes, EPA examined its tracking data for the previous 5 calendar years (1994 through 1998) for Federal Highway Administration draft and supplemental draft EISs. The FHWA EISs represent the majority of all transportation projects reviewed by the EPA. During the years 1994–1998, EPA staff reviewed a total of 252 draft or supplemental draft environmental impact statements for proposed highway projects. Of those 252, EPA rated 2 as environmentally unsatisfactory because the Agency believed the environmental impacts were of sufficient magnitude that the project should not proceed as proposed and 4 as inadequate for not presenting enough information so the reviewer could assess the significance of the potential environmental impacts of the proposed action or EPA had identified reasonably available alternatives not discussed in the document. All 6 await final FHWA determination. EPA has not referred any FHWA project to the CEQ during this time period. Below is a list of the 6 projects mentioned above:

- Southeastern Expressway Improvements, Chesapeake and Virginia Beach, VA
- CA-125 South Route Location, San Diego County, CA
- Inter-County Connector Improvement, Montgomery and Prince Georges Counties, MD
- I-880/CA-92 Interchange Reconstruction, Alameda County, CA
- Cross-Base Highway Project, Pierce County, Washington
- San Francisco-Oakland Bay Bridge, San Francisco and Alameda Counties, CA

Question. Which transportation projects have EPA grants recipients opposed in the last five years?

Answer. The Agency does not have a data base which contains information on the positions taken by EPA grantees on transportation projects. The Agency does not administer a grant program designed to oppose transportation projects, nor does it

award grants for costs incurred for lobbying and filing claims against the U.S. Government. These costs are unallowable under OMB Circulars relating to grants. Additionally, Section 409 of EPA's fiscal year 1999 Appropriation Act provides that grant funds may not be used to pay the expenses of, or otherwise compensate, non-federal parties to intervene in Federal regulatory or adjudicatory proceedings. EPA monitors the activities of grantees to fulfill the Agency's fiduciary responsibility to ensure that the funds it grants to recipients are used for the purposes outlined in the grant award. However, EPA does not keep track of activities grantees carry out with their own funds.

Question. DeVillars credited EPA for stopping construction of the Nashua Circumferential Highway in New Hampshire.

Answer. The Nashua Circumferential Highway was a proposed 12-mile-long expressway around the City of Nashua, New Hampshire. Because of the proposed highway's significant adverse impacts to exceptionally valuable wetlands, wildlife habitat, and water quality, EPA exercised its authority under the Clean Water Act to prevent construction of the southern segment of the project, and advocated a so-called partial build solution entailing construction of up to 7.5 miles of the northern portion of the road. The partial-build option will achieve 85 percent of the transportation benefits of the full-build, at less than half the environmental cost and at half the capital cost. EPA's action was supported by the City of Nashua and the three other affected towns, and the Governor. The New Hampshire Department of Transportation is currently developing plans to proceed with the partial-build highway.

Question. Is it policy of EPA to stop transportation projects? What tools does EPA use to stop transportation projects?

Answer. It is not the policy of EPA to stop transportation projects. We do, however, use our statutory authority to ensure that projects are designed and built in a manner that minimizes adverse impacts to the environment.

NPDES PERMITTING PROGRAM FUNDING

Question. As of March 1998, EPA had not re-issued 38 percent of permits for major facilities and 76 percent of permits for minor facilities. This led to the Administrator declaring NPDES permit backlogs as a new Material Weakness under FMFIA. Why does the fiscal year 2000 Annual Performance Plan include only a 1.5 percent increase for the NPDES Permitting activity in the Regions? Are these resources sufficient to address this problem? The Agency received a 2.6 percent increase from Congress for its Environmental Programs and Management (EPM) operating budget in fiscal year 1999 and yet EPA cut the Headquarters NPDES Permitting activity over 24 percent from fiscal year 1998 to fiscal year 1999 enacted levels. Why did the Agency, knowing in the Spring of 1998 that NPDES permitting backlogs were a candidate for material weakness, make this cut?

Answer. EPA increased the Regional NPDES budget by 23 percent and the Headquarters NPDES budget by 45 percent in the fiscal year 2000 President's Budget. A portion of this increase allows for a multi-pronged approach to eliminating backlog in delegated and non-delegated States, including (1) direct permit issuance assistance to several Regions and States; (2) broader use of tools developed in some Regions and States such as general permits, electronic permit programs, and streamlined procedures to expedite issuance; and (3) the development of strategies in partnership with States for eliminating backlog while maintaining high permit quality. As we implement these initiatives, we hope to better assess the sufficiency of available resources to eliminate the backlog. EPA does not currently have a complete picture of the resource needs at the State level, but will develop a better understanding through an ongoing resource gap analysis (to be completed Fall 1999) and by partnering with high backlog States to develop specific State strategies for eliminating backlog. In terms of fiscal year 1999, while the Headquarters permitting activity was reduced from fiscal year 1998 Enacted levels, total NPDES permitting resources (including Regional resources where the bulk of the permitting effort is located) rose over 20 percent from fiscal year 1998 Enacted levels. It should be noted that the headquarters cut was consistent with the overall extramural reduction taken across the water program as a result of the EPM general reduction.

Question. The backlog in EPA issued Major NPDES permits has tripled over the last 10 years and the NPDES permit universe will expand in the storm water and concentrated animal feeding operation areas. The fiscal year 1998 Integrity Act Report stated that without timely permit re-issuance, necessary improvements in water quality will not occur. How does the timely re-issuance of NPDES permits improve water quality?

Answer. NPDES permits establish specific, enforceable pollutant discharge targets that must be achieved by the permittee to ensure that water quality is protected

and that technology goals are achieved. If the permit is current and properly drafted, it should reflect all current and applicable water quality and technology goals. If the permittee complies with all of its permit conditions, the environment should be protected.

If, however, the current permit-holder has submitted a timely and complete permit application for renewal of its permit, and the permitting authority fails to issue a new permit prior to the expiration date, the expired permit will generally be administratively continued, allowing the conditions and requirements to remain in effect until the new permit is issued. Federal regulations permit administrative continuances under these circumstances for federally-issued permits, as do most states. States and EPA remain able to take enforcement actions against violations of these "administratively continued" permits. In many cases, EPA or the state would re-issue the same permit levels, in which case, the backlog of these permits poses no threat to the environment. In other cases, a new or revised effluent guideline, water quality standard or TMDL would cause the permitting agency to revise the permit levels. In these cases, the "administratively continued" permits are less protective of the environment.

SAFETY OF FOOD FUNDING

Question. The fiscal year 2000 Annual Performance Plan includes a substantial funding increase to meet the Agency Objective of Reducing Use on Food of Pesticides Not Meeting (Food Safety) Standards. The reason this large increase is needed in part, however, is because EPA cut this program itself in the fiscal year 1999 Enacted Operating Plan. Why, when Congress gave EPA a 2.6 percent increase from fiscal year 1998 to fiscal year 1999 enacted levels for Environmental Programs and Management, did the Agency cut efforts to reduce use on food of pesticides not meeting standards by over 16 percent from fiscal year 1998 to fiscal year 1999?

Answer. While the Agency did receive a small increase in the Environmental Program Management (EPM) appropriation, this increase was offset by the combined effect of Cost Of Living Adjustments (COLAs) for staff, increases in rent and other infrastructure costs, and by congressional set-asides. These factors contributed to reductions in numerous Agency programs, including several priority areas such as the Agency Objective of Reducing Use on Food of Pesticides Not Meeting (Food Safety) Standards.

Question. In general, are the health risks to adults and children from current pesticides which need to be reregistered to meet new statutory food safety standards relatively greater than the risks posed by new pesticides?

Answer. Many older chemicals have risk profiles that are not of concern, however, a significant number of major chemicals that have not yet been completely reviewed through reregistration or tolerance reassessment have risk characteristics of concern to the Agency. For example, over 5000 of the 9728 food tolerances that need to be reassessed under FQPA are in "Group 1", meaning that they appear to pose the greatest risk to public health. These may include the organophosphates, carbamates, organochlorines and pesticides considered probable or possible human carcinogens.

Question. How did EPA's 20 percent cut from fiscal year 1998 to fiscal year 1999 enacted levels for the Reregistration Eligibility Decisions activity, which contributes to the Agency Objective of Reducing Use on Food of Pesticides Not Meeting (Food Safety) Standards, affect the Agency's ability to make those decision and improve the safety of food produced and consumed by Americans?

Answer. The Agency continues to hold the safety of our food supply as one of its highest priorities. Those activities which most directly affect our food safety, such as tolerance reassessments and registration of reduced risk pesticides were protected from budget reductions to the extent possible. We are continuing to place greater emphasis on reregistration of chemicals which have food uses, in particular to those which affect children's foods. The reductions to the Reregistration program in both Reregistration Eligibility Decisions (REDs) and Special Review will affect REDs production in both this year and 2000, and will affect both food and non-food use. However the extent of the delay in these reregistrations has not yet been fully evaluated. Our efforts to make decisions on those chemicals which are of highest concern, such as the organophosphates, carbamates and carcinogens remain a priority. The Agency continues to work with the registrants and other stakeholders in order to maximize our resources and minimize the impact of these reductions.

Question. How did EPA's 40 percent cut from fiscal year 1998 to fiscal year 1999 enacted levels for the Special Review activity, which contributes to the Agency Objective of Reducing Use on Food of Pesticides Not Meeting (Food Safety) Standards, affect the Agency's ability to perform those reviews and improve the safety of food produced and consumed by Americans?

Answer. See above.

AGENCY PERFORMANCE MEASURES

Question. The Agency's only performance measures towards GPRA implementation in the fiscal year 2000 Annual Performance Plan concern completing the measures in a timely manner. Why does the Agency not include any qualitative GPRA performance measures or goals such as increasing the number of outcome based goals or measures?

Answer. The Agency is committed to improving its performance measures and developing outcome measures and goals where appropriate and when data are available. In other words, we are pursuing practical improvements in the manner of expressing and measuring performance goals, but not in a single-minded manner. Your suggestions that EPA could measure its progress in GPRA implementation via the number of outcome-based performance goals is an intriguing idea. However, such a measure, by itself, would mask several considerations. Among these would be the ability to measure prospective outcomes, which varies among our environmental programs. Also, each of the Agency's programs needs a complementary set of both output and outcome measures and goals to effectively manage and assess how individual program activities contribute to achieving the Agency's long-term strategic commitments. The optimal set of performance measures and goals, therefore, will be different for each program.

Question. The General Accounting Office estimates that outcome performance measures make up only 15 percent of the performance measures in the fiscal year 2000 Annual Performance Plan and Congressional Justification. Does EPA believe the current number of outcome measures versus the number of output measures is adequate to measure the Agency's impact on the environment?

Answer. EPA's intended long-term positive impacts on the environment are expressed in the EPA Strategic Plan's environmental goals (Goals 1-6) and general objectives under those goals. The majority of these general objectives articulate the Agency's intent to achieve specific environmental outcomes. The Agency is committed to be able to measure progress towards achieving these objectives by the target year for each strategic objective (e.g., 2005). In the Agency's Annual Performance Plan, EPA provides annual performance goals and measures for activities the Agency plans to conduct over the year that are necessary for achieving the longer-term strategic environmental outcome objectives. Where needed, the Agency intends to develop the necessary data, analytical methods, indicators and measures to be able to assess progress in achieving these longer-term strategic environmental outcome objectives. Outcome-oriented annual performance measures and goals will be incorporated into future Annual Performance Plans as necessary data and analytical methods become available, and the Agency expects the percentage of outcome-based performance goals to increase.

Question. How does the Agency believe its actions impact the environment and human health positively if the Agency is unable to measure change in behavior in the regulated community or the environment which result from EPA activities?

Answer. Both of the measures you cite are certainly important ways to gauge the value of environmental programs, but clearly there are other kinds of information necessary to grasp the positive impacts of EPA's actions. For example, every significant regulatory action entails exhaustive consideration and analysis of risk, economic, and societal impacts. We acknowledge, however, that better measures of societal behavior and environmental trends would certainly help us assess the Agency's priorities and performance. This in fact is EPA's whole purpose in creating its integrated planning, budgeting and accountability framework. Thus, as we have indicated above, we are seeking steady improvement in measuring such outcomes, and using these measures in performance plans.

Question. What resources in dollars and FTE does the Agency currently devote towards developing performance measures? What level of resources are required to develop additional outcome performance measures?

Answer. EPA's accounting system does not specifically track dollars and FTE devoted to developing performance measures. In general, however, each of EPA's programs identifies the specific data and methods required for effective results-based management at all organizational levels, thereby incorporating associated resource requirements into routine program and project planning. In addition, the Center for Environmental Information and Statistics, as part of the Agency's new Information Office, is in the process of assessing the Agency's long-term strategic information needs.

Question. What steps is EPA taking to increase the ratio of outcome measures versus output measures?

Answer. As stated above, the Agency expresses its intended long-term strategic environmental outcomes in EPA's Strategic Plan's general objectives. Specific outcome-oriented annual performance goals and measures that evaluate the Agency's progress in achieving these environmental outcome objectives will be incorporated into the Agency's Annual Performance Plans as data and assessment methods become available.

ENFORCEMENT PERFORMANCE GOALS AND MEASURES

Question. Thirteen of fifteen performance measures in the Enforcement and Compliance Assurance program's objective to Reduce Noncompliance measure outputs such as inspections, investigations and reports generated. Is changing the behavior of the regulated community or impacting the environment positively a goal of the Enforcement program and if so why does the program not measure more of its performance toward these type of goals?

Answer. Changing the behavior of the regulated community and impacting the environment positively are the results which EPA's enforcement and compliance assurance program strive to achieve and measure. Under the objective about reducing noncompliance, there are actually five outcome measures which pertain to environmental impact and changing the behavior of the regulated community. They are: percent of enforcement actions which require pollutant reductions; estimated pounds of pollutants reduced; rates of noncompliance for selected environmental problems (which measures compliance behavior of certain regulated populations); percentage of significant violators with recurring significant violations within 2 years (which measures recidivism behavior of the most serious violators); and average time for significant violators to return to compliance (which also measures behavior of the most serious violators). All five of these outcomes measure environmental impact or behavior change which is due, at least in part, to the actions of EPA or state enforcement efforts. In addition, we are working to develop other measures of environmental impact and behavior change for this objective. These additional measures are: percent of enforcement actions which lead to changes in use or handling of pollutants by facilities; and percentage of enforcement cases which lead to improvement in environmental management practices and information at facilities.

Question. All of the performance measures regarding Compliance Monitoring Activities are measures of Agency outputs such as investigations or inspections. Does the Enforcement program not expect these activities will produce a change in behavior by the regulated community or improve the environment? If the Agency believes these activities will change behavior or improve the environment, how is the Agency measuring this improvement?

Answer. EPA believes that compliance monitoring activities such as inspections and investigations contribute to behavior change and environmental improvement. EPA's inspection presence contributes to improved rates of compliance and individual inspections result in changes and improvements at specific facilities. To measure these facility-specific changes, EPA's Region II office is conducting a pilot project to document results (e.g., changes in environmental management practices) achieved through individual objectives. The pilot project will be completed by December 1999, the results of the pilot will be reviewed, and a decision will be made about whether to implement the pilot for the entire national program.

Question. The performance measure for the Compliance Incentive activity, which encourages entities to conduct audits and disclose and correct violations, contains only an output measure tracking the number of facilities participating in the program. Does the Agency not believe this policy produces environmental benefits? If the Agency does believe these policies are improving the environment, how is the program measuring this performance?

Answer. The performance measure for compliance incentive activity—i.e., the number of facilities that self-disclosed potential violations—focuses on an outcome that actually results from a change in behavior by a regulated facility. Facilities and companies come forward voluntarily to use the audit and self-disclosure policy developed and offered by EPA. In addition, we are beginning to measure the same kinds of environmental and behavioral change outcomes for audit policy settlements that we are currently measuring for completed enforcement actions.

Question. While the Enforcement and Compliance Assurance program included a performance measure tracking the increase in Small Business Compliance Assistance Center (Center) usage in fiscal year 1999, there is no similar measure in fiscal year 2000. Is increasing Center usage no longer a goal of the program?

Answer. The fiscal year 1999 performance measure regarding increased usage was designed to capture increased activity from the expansion of Compliance Assistance Centers, of which 5 were added in fiscal year 1999. There are no new Centers

planned for fiscal year 2000. The fiscal year 2000 Plan, for Goal 9, Objective 2, includes a measure of "Number of facilities reached through targeted compliance assistance" which would include facilities receiving compliance through the centers or any other program initiative.

Question. The fiscal year 2000 Annual Plan and Congressional Justification no longer contains performance measures of Federal Actions under the National Environmental Policy Act. Is this a function no longer engaged in measurable performance?

Answer. The fiscal year 2000 Annual Plan contains a performance plan measure for NEPA implementation under Goal 9, Objective 2, Sub-Objective 3. The measure reads "325 major proposed Federal actions, i.e., Draft Environmental Impact Statements (DEIS) to be filed"

Question. Why are the performance measures under development in the National Performance Measures Strategy (Strategy) and scheduled to become operational in fiscal year 1999 or at the beginning of fiscal year 2000 not in the Agency's fiscal year 2000 Annual Plan?

Answer. All of the measures scheduled to become operational in fiscal year 1999 or fiscal year 2000 under the National Performance Measures Strategy are incorporated into the fiscal year 2000 Annual Plan. In the Annual Plan, measures being developed under the Strategy are sometimes stated more specifically and in terms of a target. For example, Set 2 of the Strategy is described as "Environmental and human health improvements from EPA enforcement actions." In the Annual Plan, we have used two measures from Set 2—percent of enforcement actions that require pollutant reductions, and pounds of pollutants reduced—and set targets for each.

Question. Will the Strategy implement Phase II performance measures of statistically valid compliance rates and environmental and human health improvements by the beginning of fiscal year 2000?

Answer. EPA is currently working with a statistical consultant on a methodology for developing statistically valid rates of compliance. At the beginning of fiscal year 2000, EPA regional offices will be asked to conduct inspections based on a random and representative sample of facilities in selected regulated populations. These random inspections, combined with inspections based on other targeting criteria, will be used to generate statistically valid compliance rates. The rates will be based on all inspection activity conducted through the end of fiscal year 2000.

Question. One EPA official has suggested that the amount of money spent in "supplemental environmental projects" (SEPS) as part of settlements is a good measure of the Enforcement and Compliance Assurance Program's impact. In fiscal year 1998, EPA enforcement action resulted in \$90 million worth of SEPs. Is \$90 million in SEPs a good return on the \$321 million spent under Goal 9 in fiscal year 1998?

Answer. Money spent in "supplemental environmental projects" is one of several measures of the environmental impact that EPA enforcement actions can achieve. Setting a specific amount of SEP dollars as a goal or target to achieve would be an inappropriate performance measure, since SEP amounts are a by-product of specific cases targeted through criteria involving noncompliance patterns and/or environmental risk. In addition, comparing the SEP dollars generated to the total amount spent under all of Goal 9 is inappropriate since only a portion of the resources under Goal 9 are dedicated to enforcement cases.

COMPLIANCE ASSISTANCE

Question. Steven Herman, Assistant Administrator for Enforcement and Compliance Assurance, stated at a January 1999 conference that "EPA is a law enforcement Agency." Is it the position of EPA that EPA is a law enforcement Agency?

Answer. Protecting the public and the environment from risks imposed by violations of environmental laws and regulations is, and always has been, basic to EPA's mission. Formal law enforcement is one important component of EPA's responsibilities and will continue to be a central and indispensable element of our efforts to ensure compliance. EPA's strong and aggressive enforcement program has been the centerpiece of efforts to ensure compliance and has achieved significant improvements in human health and the environment.

Question. If "EPA is a law enforcement Agency," is the Agency still committed to non-law enforcement tools such as Compliance Assistance which would bring about compliance? Does reducing the Compliance Assistance program stem from the belief that "EPA is a law enforcement Agency" and thus should not be engaged in Compliance Assistance programs?

Answer. EPA is not reducing its compliance assistance program. The Agency is actually increasing funding to several important compliance assistance activities, such as to the compliance assistance centers and for tools development.

EPA is committed to using the full set of available tools—including compliance assistance—in the pursuit of compliance assurance. Although formal law enforcement is the cornerstone of our efforts, the continuation of serious environmental problems and changes in the scope and types of activities and entities that are regulated requires EPA to use a range of approaches to motivating environmental law compliance. Formal civil and criminal enforcement are supported by effective compliance assistance and compliance incentive programs. In fact, it is the very success of its formal enforcement program that has allowed EPA to develop these complementary programs over the last several years.

Proceeding from the 1994 reorganization of enforcement and compliance operations, EPA has built a very robust compliance assistance program. The Agency has developed and implemented a new set of policies and tools to further improve environmental compliance. EPA provides information on federal rules and regulations through the nine compliance assistance centers which we are committed to sustaining in the future. The Agency has also developed 27 sector notebooks, 18 plain language guides, and self-auditing checklists and protocols. EPA has been and will continue to work cooperatively and productively with those in the regulated community who want to do the right thing but may need some assistance to get there.

EPA's 2000 budget request does not reflect a shift in compliance assistance resources to enforcement activities. Through a recent study of Regional enforcement and compliance work, we learned that our previous methodology identified more workyears providing compliance assistance than were actually doing this type of work. EPA's fiscal year 2000 budget displays how regional resources have actually been applied.

Question. The fiscal year 2000 Annual Performance Plan states the Agency plans to reduce the compliance assistance program with the expectation that the states will assume the majority of this work in fiscal year 2000. The Agency has cited the inability of the states to perform fully their environmental duties as the rationale for a wide range of positions including the need to maintain a Federal enforcement and compliance assurance presence. Why is the Agency attempting to devolve the Compliance Assistance Program to the states if it does not trust the states are capable of maintaining the full range of environmental programs?

Answer. As with many of our other environmental protection responsibilities, EPA relies on a strong and effective state-EPA partnership to provide effective compliance assistance to the regulated community. EPA's role has been and continues to be to develop and distribute compliance assistance information and tools for business and industry. As the primary providers of direct assistance to the regulated community, states and localities and other compliance assistance providers use or adapt EPA compliance assistance materials to reflect specific state or local requirements. We believe this relationship has been very successful in improving the regulated community's awareness and understanding of its environmental obligations.

This belief was supported by participants from a wide range of public and private sector organization who attended recent conferences on EPA's compliance programs. These participants confirmed the value of EPA's compliance assistance tools and materials and urged us to continue developing general compliance assistance tools that are widely applicable and that are made widely available through the Internet, toll-free hot lines and other appropriate channels. We also heard strong support for the view that states are the first-line, on-site purveyors of compliance assistance. EPA is continuing to work with the states and other assistance providers to develop a strong network that exchanges information and tools and minimizes duplicate services.

Question. The 2000 Annual Performance Plan states an analysis of Regional resource information indicated many of the compliance assistance resources are actually conducting inspections and pursuing cases since the Office of Enforcement and Compliance Assurance (OECA) reorganization. How much of these resources were shifted to enforcement duties over the years after the reorganization?

Answer. OECA recently conducted a study of the compliance assistance and enforcement work being done in the Regions during the 1998 and planned for 1999. Results from the study prompted us to revisit the methodology previously used to estimate regional resources dedicated to compliance assistance activities. We found that the previous methodology identified more workyears providing compliance assistance than were actually doing this type of work. In order to be consistent with the Government Performance and Results Act framework of aligning resources with intended use, our fiscal year 2000 budget request reflects how our regional resources have actually been utilized between compliance assistance and enforcement (rather than a shift from compliance assistance to enforcement.)

Question. What compliance assistance guidance and tools development would the Agency not perform if it made its proposed cuts in this area under the fiscal year 2000 Annual Performance Plan?

Answer. EPA will focus its efforts on developing widely applicable compliance assistance information and tools related to national program concerns. We would look to the states and other public and private compliance assistance providers to develop and disseminate compliance assistance tools that address a situation specific to a geographic area or localized industry. Further, we would devote a greater portion of our staff resources to in-house compliance tool development from contract management responsibilities.

Question. What compliance assistance would the Agency not provide Federal Facilities if EPA made the proposed cuts under the fiscal year 2000 Annual Performance Plan?

Answer. EPA will continue to provide compliance assistance to Federal facilities through its new on-line compliance assistance center and through the development of guides, manuals and other compliance assistance tools. On-site assistance activities conducted by the Regions, including environmental management reviews and pollution prevention opportunity assessments, would be reduced. Conferences, workshops and training for Federal facilities also are likely to be impacted, although this may be somewhat offset by regional staff using in-house resources in lieu of contract support efforts.

Question. An Agency Task Force on Innovative Approaches to Environmental Protection recommended EPA adopt a holistic Agency-wide strategy for compliance assistance that encompasses the full range of the regulatory program, from rulemaking through compliance and enforcement. The program of general compliance assistance would enable EPA to develop a compliance assistance approach that included a compliance guide and a self-audit checklist for each new major regulation, develop a set of delivery options for each tool and evaluate the effectiveness of each tool.

How much would it cost per year to develop compliance assistance tools as part of the rulemaking package for every major new regulation?

How much would it cost per year to deliver compliance assistance tools to the regulated community and to organizations likely to have contact with the regulated community as part of the rulemaking for every major regulation?

How much would it cost per year to: (1) begin wider dissemination of compliance assistance and pollution prevention information and tools to State, local, tribal and private compliance assistance providers; (2) develop a clearinghouse of compliance assistance materials and tools; (3) begin developing a national network of federally-funded business and environmental assistance programs by convening a national meeting in 1999 to identify general principles for collaboration; and (4) convene a national Compliance Assistance Forum to share information with participants on recently-developed compliance assistance materials, get stakeholder input in setting priorities for development of compliance assistance materials, and facilitate exchange of tools.

Answer. To date, the report drafted by the Agency Task Force on Innovative Approaches to Environmental Protection has not received final approval from Administrator Browner and is still being revised. Also, we intend to get the input of other public and private compliance assistance providers in setting priorities for development of compliance assistance materials. Therefore, it would be premature to offer estimates of the resources required to implement this report since its final content is unknown.

SMALL BUSINESS COMPLIANCE ASSISTANCE CENTERS

Question. How many and which of the Small Business Compliance Assistance Centers (Centers) have submitted multi-year operating plans to the Agency? What is the total cost of all the Centers in fiscal year 2000 as submitted by the Centers to EPA in their multi-year operating plans? What is the total EPA funding requested in fiscal year 2000 by the Centers in their multi-year operating plan?

Answer. In 1998, the Center Grantees were asked to develop five-year operating plans in order to initiate discussions on long-term planning. The five-year operating plans developed by the grantees describe the overall plans for the individual Centers, outline the Center goals, and present strategic plans over the five-year period. All nine Centers are addressed in the operating plans. Through this planning exercise, the grantees identified their options, needs, and desires to maintain and enhance their Centers. Projected funding requests for fiscal year 1998 through fiscal year 2002 were identified in the plans, but there was never a commitment made that the requested funds would be available or received. That was understood dur-

ing the development of the operating plans. Instead, the five-year operating plans are a planning tool which project an fiscal year 2000 total operating cost of approximately \$2,960,000 for the nine Centers, which assumes contributions from EPA, in-kind contributions from the Grantees, and revenue-generating proposals as well. Of this amount, approximately \$1,596,000 was specifically requested in EPA to fund the Centers in fiscal year 2000.

Question. What level of funding does EPA include in its fiscal year 2000 President's Budget Request for Center Operating costs? What levels of funding has EPA verbally indicated at the staff level it will provide each of the Centers in fiscal year 2000?

Answer. The President's fiscal year 2000 Budget includes a request of \$1,500,000 to fund EPA's portion of Center operating costs in fiscal year 2000. EPA staff have not verbally provided the Center grantees with an indication of the amount of funding that EPA will provide to each Center in fiscal year 2000.

Question. What indications has EPA received from the Centers as to whether they will be able to meet their goals of self-sufficiency in fiscal year 2000 and beyond? Does EPA believe the Centers will meet their non-EPA contributions towards self-sufficiency in fiscal year 2000 and beyond?

Answer. EPA does not believe the Centers will achieve self-sufficiency in fiscal year 2000, and has serious doubts as to whether the Centers can achieve self-sufficiency beyond fiscal year 2000. The Centers are exploring various mechanisms to generate funds to support Center operations. For example, various Centers have attempted to generate funds through a Web site registration fee, seeking industry contributions, and selling advertising space and compliance assistance tools. To date, such activities have generated minimal revenue compared to what is needed to maintain the Centers. In addition, it has been argued that activities which require payment conflict with the Centers' mission to provide readily available compliance assistance information to small businesses.

Question. Will EPA allow Centers to close if the Centers are unable to meet their self funding goals and EPA funding is insufficient to meet Center operating costs? Will EPA allow Centers to become inactive or otherwise unable to provide updated information to compliance assistance clients?

Answer. In the fiscal year 2000 EPA President's budget, the viability and maintenance of the nine Centers is assured. Although we cannot be certain of out-year budgets at this time, we view the Centers as a priority. To best meet the needs of the customers of the nine Centers, it is critical that EPA be provided flexibility with regard to the funding allocations for each individual Center. The Agency takes into account a variety of factors, such as national program priorities, available funding, client needs, costs of different Center services, changes in sector requirements on an annual basis, and Web site usage trends to appropriately allocate annual funds to each of the nine Centers.

Question. How many visitors did the Centers have to their websites in fiscal year 1999? How many "hits" are the Centers' websites currently receiving per month?

Answer. The Centers have experienced over 150,000 user sessions in the first six months of fiscal year 1999. Since January 1999, the Centers have experienced an average of 405,000 "hits" per month. We believe that the number of user sessions, the number of visits to the a site (not the number of pages visited or hit), is the most accurate figure to use to gauge Centers' usage.

Question. How many frequent Centers website visitors are taking some positive action in their facilities concerning environmental compliance? What percentage of total frequent website visitors does this represent?

Answer. In fiscal year 1998, on-line surveys were posted on five Centers for two months to assess use rates and user satisfaction of the Centers. Of the center users, 905 responded to the surveys (representing a 6-15 percent survey response rate.) Eighty-five percent of the users who completed the surveys (surveyed users) stated that they visit the centers at least monthly, and nearly one third of the surveyed users stated that they visit the centers weekly. Survey respondents also identified behavioral changes that resulted from their use of the Centers. Of the 214 survey responses addressing behavioral change, 81 percent stated that they took an action as a result of using the Centers. For example, Center users contacted a vendor, requested technical assistance, contacted a regulatory agency, changed a process, obtained a permit, or changed waste handling practices.

Question. It is estimated that because of their small size, EPA and state regulators are unable to and thus will not visit or inspect more than 200,000 of the 500,000 auto service and repair establishments. Likewise, EPA and/or state regulators will not visit between 90 and 95 percent of printers because they are small quantity generators and regulators are appropriately targeting larger facilities. Does

EPA have any statistics on the number or percent of facilities in the other sectors covered by Centers which EPA will not reach because of their size or other factors?

Answer. The Agency targets industry sectors (sectors) for inspections based upon the sector's compliance history and impact on the environment, such as pollutant releases and risk. In addition, facilities may be inspected based on tips and complaints from the public; the length of time since last inspected; demographic considerations; new regulatory requirements which impact the facility; facility classification or size; and other considerations. The Agency's fiscal year 2000/2001 OECA Memorandum of Agreement Guidance identifies the following national EPA priorities for fiscal year 2000/2001 based on the factors listed above: (1) Clean Water Act—wet weather; (2) Safe Drinking Water Act—microbial rules; (3) Clean Air Act—New Source Review/Prevention of Significant Deterioration; (4) Clean Air Act—air toxics; (5) Resource Conservation and Recover Act—permit evaders; (6) petroleum refinery sector; and (7) metal services (electroplating and coating) sector.

In general, the Agency tends to target larger facilities for inspections, while small businesses tend to be targeted for compliance assistance activities unless they are the subject of a citizen complaint or place the community at risk due to their practices. The establishment of the nine Centers has enabled the Agency to reach a far greater number of small businesses than could be accomplished through EPA site-visit activities. This was one of the reasons for establishing the Centers. But for the printed wiring board manufacturing sector, the sectors covered by the Centers are comprised of numerous facilities, many of which are small businesses. As with the auto service and repair and printing sectors, limited resources do not allow EPA and state regulators to annually visit or inspect a majority of the facilities within these sectors. For example, EPA estimates that (1) 50 to 60 percent of the transportation sector covered by the Transportation Environmental Resource Center are not inspected annually; and (2) 70 percent and 50 percent of the chemical preparation and industrial organic chemical manufacturers respectively are not inspected annually. State activities are generally not reported to EPA on a sector basis.

AGENCY AUDIT POLICY: SELF DISCLOSURE OF POTENTIAL VIOLATIONS

Question. What percentage of disclosures under the Audit Policy disclosed paperwork or record keeping violations versus disclosures of environmental violations as measured by recent study of the audit policy?

Answer. Eighty-four percent of the disclosures evaluated involved violations of reporting, record-keeping, or labeling requirements. I should note that many violations of emission or discharge standards are required to be identified by prescribed monitoring (e.g., through stack testing or daily sampling). Because such violations are identified and reported through required monitoring rather than through voluntary audits, they are not eligible for relief under either EPA's policy or state audit laws.

Question. If a goal of the Enforcement and Compliance program is to have 75 percent of concluded enforcement actions require environmental or human health improvements, why does the current Audit Policy emphasize paperwork or record keeping violations?

Answer. While EPA is committed to obtaining human health or environmental improvements from concluded enforcement actions, this term encompasses those cases that EPA initiates after independently identifying a violation. We have generally not considered violations that are voluntarily disclosed and corrected under our audit policy to be "enforcement actions" in the traditional sense. For example, these disclosures are separately tracked in our docket, and many cases can be resolved by issuing a letter indicating that noncompliance has been corrected. As noted above, many violations of discharge and emission requirements are required to be monitored and reported, and are therefore not eligible for relief under either EPA policy or state law. Many so-called "paperwork requirements are mandated by laws established by Congress, and operate to prevent spills, serious accidents or other mishaps. The audit policy has proved to be an efficient means to obtain voluntary compliance with such requirements.

Question. Would changes in the type of penalties reduced by the Audit Policy produce more disclosures and thus prompt correction of environmental violations as opposed to violations of paperwork or record keeping requirements?

Answer. EPA is considering non-penalty-related changes to the Audit Policy that we hope will encourage additional disclosures. Our recent proposal in the Federal Register suggests that disclosure time from point of discovery be extended from 10 to 21 days, and that a multi-facility corporation not necessarily be disqualified from the policy for disclosures made at a facility even where an investigation has occurred at another of its facilities. EPA is also encouraged by the results of targeted

outreach and views it as a mechanism for encouraging disclosure of more substantive violations. It is our experience that the greatest gains under the Audit Policy are made when EPA reaches out to a specific industry sector, in some cases identifying recently-enacted regulations or those that may be prone to noncompliance within that sector, and invites the sector to audit and disclose. For example, EPA's outreach effort with the telecommunications industry resulted in violation disclosures and corrections at over 700 facilities.

It is unclear, however, that changes to the Audit Policy will necessarily affect the volume of disclosures made by regulated entities. The recent National Conference of State Legislatures study found no statistically significant difference in auditing rates based on whether the state in which the facility operates has an environmental audit law, audit policy, or no law or policy. It follows that changes to an existing policy may have a similarly insignificant effect.

Question. What percentage of disclosures made under the Audit Policy have been made under Federal programs which are not delegated to the states?

Answer. Ninety-two percent of the disclosures made to EPA involve programs for which EPA has lead responsibility. In general, we would expect most disclosure to be made directly to the state agencies that are authorized to administer federal programs, and have taken steps to avoid inconsistency and confusion, and thereby encourage disclosures at the state level. EPA has worked closely with states such as Texas, Ohio, Michigan, South Dakota, and Minnesota to assure that state audit immunity laws provide incentives to disclose while meeting minimum requirements necessary for authorized federal programs. Other states, such as California, Florida and Pennsylvania, have worked with EPA to develop appropriate policies to encourage self-disclosure and correction.

Question. What is the average number of pages of information EPA has obtained from entities disclosing violations under the audit policy to prove the audit was conducted properly and that the violation was properly repaired?

Answer. Although EPA does not keep data on the length of disclosure documents, typically entities disclose in several pages of text, which often includes an elective analysis of how the disclosure meets the conditions of the Audit Policy. EPA encourages disclosures to use a checklist, available on OECA's website, to assist in providing relevant information. EPA frequently receives phone calls from prospective disclosures requesting a chart or format for their disclosure.

Question. The Spring Audit Policy Update states that approximately 470 entities at more than 1,800 facilities disclosed violations under the Audit Policy. What percentage of the total number of entities or facilities committing violations in the same period do these numbers represent?

Answer. EPA does not have access to records that would indicate the total number of violations that have occurred at all facilities over the past three years. Clearly, the audit policy disclosures are a small fraction of that total. As stated above, many violations are required to be monitored under specific requirements of regulations or permits and are not discovered through voluntary audits. These include, for example, violations of discharge limits at major facilities permitted under the Clean Water Act.

Question. Why have less than one-third of disclosures made under the Audit Policy resulted in settlements?

Answer. EPA has granted penalty relief for approximately half of the facilities covered by disclosures. The difference between the number of facilities disclosed and the number of facilities provided settlement may fall into one of several situations: (1) the disclosure has not yet been resolved through settlement; (2) the disclosure did not meet the conditions of the Audit Policy; (3) upon further analysis, EPA determined that a violation did not occur; or (4) the entity disclosed to EPA the identity of several facilities at the onset of a corporate-wide audit believing that the audit would reveal violations at all facilities, and upon conducting the audit discovered violations at some but not all of the facilities. EPA is taking steps to best manage the facilities in the first category. For example, EPA is making use of self-certification and unilateral letters of determination for certain types of cases, such as those involving fewer violations. EPA encourages the use of disclosure checklists by the disclosures so that the disclosure includes all of the information needed for EPA to determine policy applicability and resolve cases in a timely fashion. In addition, EPA now has a national audit policy coordinator to field questions from Regional offices and the regulated community, and is adapting its data systems to better track pertinent case information, both of which are changes that we expect will expedite processing in many cases.

Question. Does the Agency believe the amount of environmental improvement which could be obtained through the elimination of all penalties outweigh the value

of those penalties currently collected by the Agency under the current Audit Policy? How does the Agency measure this belief?

Answer. The Audit Policy strikes a critical balance in EPA's enforcement program by rewarding parties who voluntarily and timely disclose and correct violations, while ensuring that no regulated entities gain an unfair business advantage by avoiding compliance with legal requirements. EPA believes that elimination of all penalties in Audit Policy cases would likely result in decreased environmental improvement by disrupting the balance that the Audit Policy strikes. Elimination of all penalties would provide a disincentive for entities to be proactive in environmental compliance and would provide financial incentives for those entities less diligent in environmental compliance.

ENFORCEMENT ACCOMPLISHMENTS

Question. Why did civil enforcement activity in the areas of administrative penalty order settlements, administrative non-penalty orders—cases concluded, EPA civil referrals to Department of Justice (DOJ) and civil judicial settlements all decrease from fiscal year 1997 to fiscal year 1998?

Answer. The Environmental Protection Agency's enforcement program experienced a slight decrease in traditional enforcement outputs between the 1997 and 1998 fiscal years, as measured by civil judicial referrals and settlements, and civil penalties collected. Inspections and administrative orders actually increased somewhat over that period.

Overall, we do not believe that the small decrease in civil judicial activity between fiscal year 1997 and 1998 is particularly significant. To some extent, it reflects the cyclical nature of the case development process. For example, several large settlements totaling nearly \$100 million in penalties were not entered until just after the 1998 fiscal year ended, and so were not reflected in last year's accounting.

We believe that an increased emphasis on cases that offer the greatest environmental benefit could have some impact on the total number of referrals, as such actions are more complex and require more resources. The value of injunctive relief rose from \$1.89 billion to \$1.98 billion between 1997 and 1998, reflecting a trend toward development of more significant cases. Our settlement with manufacturers of heavy duty diesel engines will reduce emissions of nitrogen oxides by 1.3 million tons, or 6 percent of the total national inventory of NO_x pollutants. We have attached a summary of the environmental results obtained through enforcement actions, which reflect our commitment to making progress in reducing actual pollutant loadings.

Question. Why did major criminal enforcement outputs such as referrals, sentences and fines decrease from fiscal year 1997 to fiscal year 1998?

Answer. The outputs for EPA's criminal enforcement efforts fluctuate somewhat from year to year based on the type and mix of cases being prosecuted by the Department of Justice (DOJ). Generally there has been a consistent trend in the growth of all outputs.

A number of the criminal enforcement outputs increased slightly from fiscal year 1997 to fiscal year 1998, while others decreased. The number of defendants indicted during this period rose 8.7 percent from 232 individual and 90 corporate defendants in fiscal year 1997 to 257 individual and 93 corporate defendants in fiscal year 1998. Additionally, the number of criminal cases initiated in fiscal year 1998 rose by 15.4 percent from 551 in fiscal year 1997 to 636 in fiscal year 1998.

Two of the outputs referred to in the question are not under the direct control of EPA's criminal program. The Federal Judiciary determines what the individual sentences are to be and the amount of the fine in accordance with the Federal Sentencing Guidelines. The total amount of jail time defendants were sentenced to serve decreased 11.7 percent from 195.8 years in fiscal year 1997 to 172.9 years in fiscal year 1998. Fines decreased from \$169.3 million to \$92.8 million. This is due primarily to the fact that the fiscal year 1997 total includes one fine for \$75 million from a particularly egregious case where a barge carrying fuel oil sank off Puerto Rico fouling the beaches at the height of the tourist season.

The number of criminal cases referred to DOJ decreased in fiscal year 1998 by 4.3 percent from 278 in fiscal year 1997 to 266 in fiscal year 1998. This decrease is attributable to a shift in emphasis to more complex, resource intensive investigations that require multiple agent involvement. As we continue to train more state and local environmental enforcement personnel, the EPA criminal program is concentrating on more complex inter-regional investigations. As a result there is an increase in the quality of cases and a decrease in the quantity of cases. State and local criminal investigators are handling the more routine and localized violations. The Criminal Investigation Division's Special Agents have been directed to place their

emphasis on cases that involve both significant environmental harm and culpable conduct. Our expectation is that this level of referrals to DOJ will remain fairly constant into the future.

Question. Is the Agency emphasizing more difficult, complex, multi-state actions which produce fewer outputs such as cases concluded or penalties achieved? Do these complex and multi-state actions produce greater environmental improvements than casework which might produce higher output totals?

Answer. Traditionally, EPA has enforced the environmental laws by bringing actions against individual facilities for violations of a single statute. Over the past few years, the Agency has broadened its enforcement efforts to address non-compliance by single companies at their facilities in more than one state, under one or more of the environmental laws. Although these complex actions may produce fewer discrete cases, the environmental benefits and resource efficiencies gained greatly outweigh the results which could have been obtained by pursuing violations at each of these facilities individually. The total penalties achieved are appropriate to resolution of the violations alleged; however, the scale of these actions provide enhanced opportunities for agreements by companies to perform supplemental environmental projects, which tend to mitigate the final penalty number reported.

In addition to increasing the environmental benefits gained, it should be noted that these multi-state cases also exemplify the uniquely effective role of federal enforcement. Single states do not have the resources or legal ability to address nationwide environmental violations in a systematic and coordinated way, or to fashion the national, comprehensive settlements now being achieved by the Agency.

An example of the benefits attained through a multi-state approach, even for violations of just one statute, is the 1996 settlement with the Georgia Pacific Corporation for alleged failure to comply with the Clean Air Act regulations at 26 of the corporation's engineered wood products facilities. The company had ignored its legal responsibility to obtain permits and to report air emissions accurately, causing annual excess emissions of more than 5,000 tons of volatile organic compounds ("VOCs," the precursors to smog and ozone) into the environment. As a result of EPA's national enforcement action, Georgia Pacific paid \$6 million in penalties, applied for the appropriate state air permits at 19 facilities, and installed state-of-the-art pollution control equipment—designed to reduce VOC emissions by about 90 percent—at 11 of the 26 facilities, mostly located in the Southeast. An additional total of \$5.25 million was committed for supplemental environmental projects, including funding critical research on air pollution in the Southern Appalachians. Finally, the company agreed to perform comprehensive clean air audits at all 26 of its wood products facilities nationwide and monitor compliance limits on a daily basis.

EPA has also obtained substantial benefits from complex, multimedia enforcement actions to address violations of two or more environmental statutes.

On April 15, 1999, EPA filed in federal court the second, final phase of a national agreement with ASARCO, Inc., a national mining and smelting company. The first phase of this agreement was completed in January 1998. The entire settlement represents the first time that the federal government has entered into a consolidated agreement that resolves violations of different environmental statutes at more than one of a company's facilities. Texas and Arizona were co-plaintiffs in this agreement.

This comprehensive approach to resolution of ASARCO's environmental liabilities protects public health and the environment by reducing the release of certain heavy metals, such as arsenic, mercury and lead, which can be toxic to both humans and wildlife. For example, the company has agreed to clean up the environmental impacts at its Montana operation that resulted from 100 years of smelting activities and to operate a subsidiary in Texas as a permitted, lawful recycling facility for metal plating and finishing wastes, one of only three in the nation. It also builds environmental safeguards for the future: A major and unique commitment by ASARCO in this historic agreement is the establishment of a five-year environmental management and compliance auditing program involving 6,000 employees at its 32 operating facilities nationwide.

Only a complex, consolidated approach to resolution of a company's environmental liabilities will create sufficient opportunity to obtain corporate-wide improvements and nation-wide environmental protections. NESS also allows the Agency to use its limited enforcement resources more efficiently in a manner that complements, but does not duplicate, the enforcement agendas of state governments. For example, instead of numerous government agencies each taking separate actions under one environmental law against individual facilities of a national corporation, only a single action is initiated. The program reduces costs, improves performance, and provides the opportunity for partnering between state and federal government and industry.

Another example is EPA's October 1, 1998, consent decree with Ashland, Inc. which resolves multimedia violations found at Ashland's three petroleum refineries,

located in Kentucky, Minnesota, and Ohio. EPA alleged that Ashland had violated the CAA, CWA, RCRA, EPCRA, and TSCA. In addition to penalties Ashland will pay \$14.9 million to perform supplemental environmental projects ("SEPs"). One SEP is an innovative project that will restore 274 acres of rare prairie grass ecosystem in Minnesota and donate the land to the State; this tract is the largest unprotected native prairie in the Twin Cities area.

The corrective actions Ashland is undertaking includes improvements to the wastewater drainage system at its Ohio facility to prevent the release of volatile organic pollutants into the atmosphere, upgrades to the wastewater treatment system at the Kentucky plant to reduce the release of harmful chemicals into the Big Sandy River, and the installation of a series of wells to prevent the release of petroleum contaminants into the Mississippi River in Minnesota. Ashland is also required to reduce particulate releases and improve the recovery of sulphur dioxide at the Ohio refinery. Sulfur dioxide is an air pollutant that can affect human health, especially that of asthmatics, harm vegetation and aquatic life by acidifying lakes and streams. The company will also undertake air monitoring and analysis in the Tri-State area of Kentucky, Ohio, and West Virginia.

Question. In fiscal year 1998, EPA enforcement actions required chemical or pollutant reductions or eliminations in almost a third of all cases. This is well below the fiscal year 2000 performance goal of 75 percent of enforcement actions requiring environmental or human health improvements. How does the Agency intend to pursue more cases which require environmental improvements and less cases which do not produce improvements but may concern paperwork or record keeping requirements?

Answer. EPA is working hard to improve its selection of enforcement priorities and its specific targeting efforts to focus on those violations that present the greatest threats to human health and the environment. Our priorities for fiscal year 2000 and 2001, for example, which were developed in consultation with EPA program offices as well as states, focus on reducing nitrogen oxides and other criteria air pollutants from unpermitted operations, toxic air emissions, the illegal and unsafe handling of hazardous waste, and "wet weather" flows of raw sewage and other contaminants from sewer collection systems. These priorities will lead to actions that result in significant environmental improvements; as noted above, our settlement with manufacturers of heavy duty diesel engines will reduce illegal nitrogen oxide emissions by 1.3 million tons.

In the meantime, EPA must still take actions that serve to identify and avoid environmental or human health risks before they become much worse. For example, risk notification requirements under various environmental laws serve to warn emergency personnel of the presence of toxic materials at particular sites, and the absence of this information has resulted in injury or death to firefighting personnel. EPA is exploring how best to measure the value of actions that prevent accidents or other serious risks, as opposed to responding to events after pollution has already been released or residents near a facility have been forced to evacuate their homes. The Agency has been particularly successful in working with the regulated community to encourage voluntary disclosure and correction of violations in return for eliminating or greatly reducing penalties. For example, since January 1998, we have concluded settlements with 11 telecommunications companies, under the Audit Policy, that have led to correction of Emergency Planning and Community Right-to-Know Act (EPCRA) and/or Clean Water Act (CWA) Spill Prevention Control and Countermeasure (SPCC) Violations at more than 700 facilities.

REINVENTING ENVIRONMENTAL INFORMATION

Question. Provide the status as of Q2/fiscal year 1999 of each REI milestone for implementation of data standards and electronic reporting into the national systems including an identification of any milestones which the Agency has missed or expects to miss as of the Q2/fiscal year 1999 and any actions, strategies or efforts to achieve missed milestones or avert missing of milestones the Agency expects to miss.

Answer. Although some interim milestones have been revised as the work dictates, the data standards development program is on schedule to be completed by February 2001. Based upon our current work, we are hopeful that we may in fact beat this date by some months. Implementation of data standards and electronic reporting in EPA information systems is on schedule to meet the REI Action Plan date of Quarter 2, fiscal year 2003.

	Status
Status of Data Standards:	
Date Standard	Final
Industrial Classification	Final
Facility Identification	Interim
Latitude/Longitude	Interim
Chemical Identification	Interim
Biological Identification	Interim
Electronic Reporting Standards	Draft standards for all systems (scheduled 12/31/99)

Question. Describe by Goal, Objective, Sub-Objective, Key Program, Office, and Activity, the level of resources including dollars and FTE assigned or loaned to REI efforts in fiscal year 1998, proposed in the fiscal year 1999 President's Budget, included in the fiscal year 1999 Operating Plan, spent in fiscal year 1999 to date, and proposed in the fiscal year 2000 President's Budget.

Answer. See the attached table.

National Goals, Objectives and SubObjectives						
Nat'l Goal & Objective	SubObjective	REI Program Components/Activities (dollars in thousands)	FY98 Actual	FY99 Op Plan	FY99 Spent to Date	FY2000 Pres. Bud.
Goal 7: Expansion of Americans' Right to Know About Their Environment Objective: Increase Quality/Quantity of Education, Outreach, Data Availability: By 2005, EPA will improve the ability of the American public to participate in the protection of public health and the environment by increasing the quality and quantity of general environmental education, outreach and data availability programs, especially in disproportionately impacted and disadvantaged communities	Public Access Strategy: Establish the strategic direction and Agency policy required to provide the public with integrated, online, user friendly access to all EPA environmental data.					
		Data Standards (Key ID/Facility/Chemical)	4.28	2.93	2.85	
		One Stop Reporting *	7.2	4.23	2.29	
		Integrated Taxonomic Info. System	0.25	0.22	0.22	17.441
		REI/NSB/Arch-Sys Support	0.7	0.59	0.52	
		Electronic Data Collection	3.2	2.67	2.67	
		Subtotal	15.63	10.64	8.55	
		Locational Data Improvement	1.25	.70	.70	
		Environmental Data Registry	1.50	1.10	.93	
Goal 7: Expansion of Americans' Right to Know About Their Environment Objective: Ability of Public to Reduce Exposure: By 2005, EPA will improve the ability of the public to reduce exposure to specific environmental and human health risks by making current, accurate substance- specific information widely and easily accessible	Provide information to the Community About Local Environment: By 2005, use it will be available to all communities and citizens to help them make informed choices about their local environment, including where to live and work, and what potential exposures are acceptable; and to assess the general environmental health of themselves and their families.	Subtotal	2.75	1.8	1.63	17.441
		PC&B	.28	.25	.17	.23
		GRAND TOTAL	18.6500	12.6900	10.3500	17.6710

Question. Identify and describe the GPRA or Agency performance measures in fiscal year 1999 and fiscal year 2000 which incorporate REI commitments.

Answer. There are two Agency performance measures in fiscal year 1999 and fiscal year 2000 which incorporate REI commitments: the One Stop Program and Facility ID.

Measure	Fiscal year 1999 commitment	Fiscal year 2000 commitment
One Stop Program ...	By 1999, the Agency will streamline and improve the information reporting process between state partners and EPA by increasing the number of participants in the One Stop program to 29 states.	By 2000, the Agency will streamline and improve the information reporting process between state partners and EPA by increasing the number of participants in the One Stop program from 29 to 38 states.
Facility ID	By 1999, establish a National Facility ID file with accurate information for 30,000 facilities that report to the TRI.	By 2000, increase Facility ID file accuracy by establishing a National Facility ID file with accurate information for 100,000 facilities.

SMALL BUSINESS REGULATORY ENFORCEMENT FAIRNESS ACT (SBREFA)

Question. With the ongoing dismantling of the Office of Policy and the potential for that office to lose its Presidential appointee, what plans does EPA have for the group which conducts Agency SBREFA activities including the panel process? Will EPA ensure that this activity is afforded the resources and attention necessary to successfully perform its function?

Answer. To date, no final decision concerning the Office of Policy has been made. EPA is proud of its record of outreach to small entities subject to environmental regulation. Along with SBA and OMB, the Agency has completed 15 Small Business Advocacy Review Panels, and the Agency has been fairly recognized for the energy and care we have devoted to our responsibilities under SBREFA. Because not only the public interest, but also the specific work of the Agency, benefits conspicuously by the inclusion of small entities in our policy decisions, we are strongly committed to maintaining the set of services. EPA will continue to devote the attention and resources appropriate to an excellent job of including small entities in the regulatory decisions that affect them.

PROJECT XL

Question. As of April 30, 1999, how many Final Project Agreements (FPA) has EPA implemented?

Answer. As of April 30, 1999, EPA had 11 FPAs in implementation and 12 proposals in the final stages of development (when the details of FPAs are hammered out). The Agency and its state partners are also in the process of reviewing and giving serious consideration to 18 additional proposals. In addition, we are working with potential project sponsors on developing written proposals for another 19 promising project suggestions and are holding initial discussions with sponsors on 20 more ideas.

Question. As of April 30, 1999, what is the total amount of dollars spent by EPA on contracts to solicit, find, encourage or obtain Project XL participants?

Answer. At the end of 1997, EPA took stock and found that most XL project proposals had been submitted to the Agency by companies. In order to identify a wider variety of XL project sponsors and ideas, particularly in areas where the Agency wanted to see innovative thinking occur (such as environmental technology, source reduction, and product life cycle), EPA issued two Requests for Proposals, one in Headquarters and one in Region I in Boston. The objective was to select three or four outside organizations which could work effectively as co-sponsors, coordinators, or facilitators and help create the wider variety of projects EPA was seeking. In Headquarters, we selected 3 organizations to help us achieve that objective: (1) the Denver Research Group in collaboration with the National Conference of Black Mayors, which proposed to develop an Environmental Management System for businesses in the Greater St. Louis Metropolitan region; (2) ML Strategies, working with the Santa Fe Council on Environmental Excellence, which proposed to bring ideas developed by a consortium of New England universities to fruition, involving improved ways to manage wastes from thousands of small research laboratories; and (3) the Minnesota Center for Environmental Advocacy, an environmental group, which proposed to work with the Mayo Clinic to reduce the hospital's toxic waste,

especially mercury and dioxin. Region I selected The Conservation Law Foundation that proposed to identify and develop especially community-sponsored XL projects. The total amount spent on these four small purchase orders by April 30, 1999, was \$195,050.

The effort was successful in that the small contracts have resulted, so far, in one Final Project Agreement to be signed in June, several promising projects still under development, and one project that had been facilitated by the XL program, but did not need to be implemented under XL to be completed.

EPA's regional office in Texas spent approximately another \$7,000 for contractor assistance in planning and facilitating the XL program share of a marketing workshop covering all of Region 6's reinvention programs. This effort resulted in one project currently being developed into a proposal. The combined efforts of the Office of Reinvention and the two regions to use contractor support to develop proposals amounts to \$202,050.

The Office of Reinvention in Headquarters spent an additional \$55,000 for contractor support over the past two years to assist it with general XL marketing activities, such as writing and designing a marketing brochure, developing a database of potential project sponsors to be contacted, organizing a meeting with consulting firms that might be interested in Project XL, writing fact sheets, and assisting with large mailings.

In summary, the total amount of dollars spent by EPA on contracts by April 30, 1999, to solicit, find, encourage or obtain Project XL participants was \$257,050.

Question. Of the FPAs EPA is currently implementing, how many originated through assistance from a contractor?

Answer. All of EPA's XL projects in implementation originated before EPA started to use contractor support for developing proposals. However, EPA is expecting to sign a Final Project Agreement in June for the New England Labs project that was developed through one of our small purchase order contracts, and several more are in the pipeline.

NPDES BACKLOG

Question. EPA has declared the backlog in the National Pollutant Discharge Elimination System (NPDES) program a material weakness. In Region 10, for example, there were 1,000 NPDES permit applications waiting to be processed of which 70 percent were over 4 years old. Why do we have this backlog?

Answer. EPA estimates that approximately 28 percent of major NPDES permits and between 28 and 47 percent of minor NPDES permits are currently expired. Of these, approximately 3.7 percent of majors, and between 16 and 34 percent of minors, have been expired for more than 5 years. As noted, EPA Region 10 has a higher than average backlog rate; approximately 60 percent of majors, and 72 percent of minors.

A number of reasons have been identified for the existence and persistence of permit backlog. Among them are the: expanding universe of facilities requiring NPDES permit coverage, e.g., the addition of Concentrated Animal Feeding Operations (CAFOs) and Storm Water to the NPDES program; the increasing complexity of the NPDES permitting program due to State adoption of numeric water quality standards, Total Maximum Daily Load (TMDL) requirements, and more complex industrial operations; increasing involvement (e.g., hearings, challenges, appeals) of outside parties in permit development and issuance slowing the overall process; and high staff turnover and training limitations at the State and Regional level. EPA is currently investigating the degree to which the above-cited reasons are impacting the program at various levels by examining permitting efficiencies and resource needs and gaps. Targeted efforts are also underway in several Regions and States to clean up incorrect permit expiration data, and to accelerate issuance of NPDES permits.

Question. What is the potential impact to the environment of not eliminating the backlog?

Answer. Environmental impacts occur when unacceptable levels of pollutants are discharged from an industrial or municipal facility. Such discharges may occur whether or not an NPDES permit has been issued, or whether the permit is current or expired (backlogged). The importance of the permit, however, is that it establishes the specific, enforceable pollutant discharge targets that must be achieved by the permittee to ensure that water quality is protected and that technology goals are achieved. If the permit is current and properly drafted, it should reflect all current and applicable water quality and technology goals. If the permittee complies with all of its permit conditions, the environment should be protected.

If the current permit-holder has submitted a timely and complete permit application for renewal of its permit, and the permitting authority fails to issue a new permit prior to the expiration date, the expired permit will generally be “administratively continued”, allowing the conditions and requirements to remain in effect until the new permit is issued. States and EPA remain able to take enforcement actions against violations of these “administratively continued” permits. In many cases, EPA or the state would reissue the same permit levels, in which case, the backlog of these permits poses no threat to the environment. In other cases, a new or revised effluent guideline, water quality standard or TMDL would cause the permitting Agency to revise the permit levels. In these cases, the “administratively continued” permits are less protective of the environment.

Question. Will the budget request allow EPA to eliminate the backlog? How much money would be required to eliminate the permit backlog in non-delegated States and in delegated States?

Answer. Our budget request allows for a multi-pronged approach to eliminating backlog in delegated and non-delegated States, including direct permit issuance assistance to several Regions and States; broader use of tools developed in some Regions and States such as general permits, electronic “permit wizard” programs, and streamlined procedures to expedite issuance; and the development of strategies in partnership with States for eliminating backlog while maintaining high permit quality. As we implement these initiatives, we hope to significantly reduce the backlog and better assess better the sufficiency of available resources to eliminate the backlog. EPA does not currently have a complete picture of the resource needs at the State level, but will develop a better understanding through an ongoing resource gap analysis (to be completed Fall 1999) and by partnering with high backlog States to develop specific State strategies for eliminating backlog.

Question. In the STAG account, the request included \$115.6 million for State water quality management grants (CWA section 106) and \$19 million for water quality cooperative agreements (CWA section 104(b)(3)), the same levels provided in the fiscal year 1999 appropriation. States use these grants to support a variety of CWA implementation activities, including permitting, standard setting, monitoring, and enforcement. How will EPA work with States to ensure that NPDES-delegated States use these resources to address their permit backlogs? How will EPA determine if States are devoting sufficient resources to this problem?

Answer. EPA will be developing backlog reduction strategies in partnership with the States that will address State-specific needs, examine and pilot new approaches, examine inefficiencies in the existing process, and set fixed targets and goals for permit issuance while maintaining high permit quality. Working through the giant negotiation process, the Agency will work to ensure that the States are developing a level of resources commensurate with their strategies and program targets and goals.

Question. If permit backlogs are such a chronic problem, what new approaches is EPA looking at, such as the self-certification program the State of Massachusetts has piloted called Environmental Results Program?

Answer. EPA realizes that the ever-expanding scope and complexity of the NPDES program has led to systemic resource shortfalls and backlogs in many States. Solutions may require bold experimentation and the widespread adoption, in certain cases, of new programs that have been successful in some States. EPA is examining a suite of innovations, including the increased use of electronic “permit wizard” programs, technical exchanges and fora between permit writers in various States, and the piloting of programs such as New York State’s Environmental Benefits Permit Strategy (EBPS), which provides greater efficiency by separating and prioritizing administrative and technical permit issuance tasks.

Question. How will the new NPDES permit requirements for animal feeding operations impact the backlog?

Answer. Over the past 25 years, the focus of the NPDES permit program has been the control of industrial and municipal point sources of pollution. To date, efforts have been directed mostly toward the more traditional point sources with discrete discharge outfalls. Sources such as concentrated animal feeding operations are not new to the NPDES program, but are point sources that have been within the scope of the NPDES program for many years. As the more traditional point sources have implemented appropriate controls, sources such as CAFOs have become sources from which controls would yield the greatest environmental benefit. As EPA and States identify and address these types of sources, the universe of facilities required to be covered under an NPDES permit will continue to expand. It is likely, however, that permitting authorities will choose to permit most concentrated animal feeding operations under general NPDES permits. Since general permits allow the coverage

of large numbers of facilities under a single permit, the increase in administrative burden to the overall permit program will be lessened.

Question. Please provide a breakout of the budget request for NPDES permitting for new permits versus updating existing permits.

Answer. EPA estimates that approximately 1,300 existing major permits and 12,500 existing minor permits expire in an average calendar year. While no precise estimates on new individual permits are available, the Agency believes that these numbers are small (perhaps 20 majors, and 500 minors) relative to existing permits. The NPDES budget request is intended to address all aspects of permitting, including new permits and re-issuance of expired permits. The budget request also supports Agency efforts to more accurately characterize the NPDES universe and to identify issues affecting the permit backlog. This includes providing assistance and guidance to States and Regions for management of Compliance data and develop backlog reduction strategies.

CWAP: ADDED FUNDS

Question. With respect to the Clean Water Action Plan, what assurances does EPA have that the added funds the agency is spending in the first year of the program are having their intended effect? What assurances can the agency provide that the public will get a good return on that investment and on the additional CWAP funds being sought for fiscal year 2000?

Answer. The fiscal year 1999 funds added for CWAP were primarily for grants to states under Section 319 of the Clean Water Act (\$95 million incremental funds)—plus \$20 million for section 106 state program management grants. The section 319 funds are being awarded on schedule, i.e., during the spring of 1999, for work that will take place later in 1999 and into 2000. Although the funds are just being awarded, we already have some assurances that the funds will be targeted at the highest priority needs. In making the incremental funds available to states, the CWAP envisioned targeting those funds to watersheds which the states and tribes identify as priorities for restoration, based on Unified Watershed Assessments (UWA's), which were to be prepared by the states and tribes. All of the states and many tribes now have completed their UWA's.

Likewise we have asked the states to upgrade their section 319 programs as a pre-requisite to receiving incremental funds in the future. We are already seeing many states and tribes upgrading their Section 319 programs to incorporate nine key elements which were identified in national guidance, which was developed in cooperation with the Association of State and Interstate Water Pollution Control Agencies (ASIWPCA). This upgrading of states' non-point source programs provides further assurance that CWAP funding is having and will continue to have the intended effect. Moreover, as we review states' non-point source program workplans, as well as project-specific and place-specific proposals for spending the incremental Section 319 funds, we see these plans and projects clearly indicating that the funds will be used for the CWAP's intended purposes, i.e., for development and implementation of watershed restoration action strategies—with the inclusion of multiple agencies and other stakeholders in both the planning and implementation phases.

EPA and other federal agencies have been working with tribal, state, and local partners to implement the more than 100 key actions in the CWAP. The first anniversary report highlights the progress made toward implementation of the Action Plan and outlines the agenda for future years. Accomplishments in the first year include the development of a national animal feeding operations strategy, development of a multi-year strategy for the development and implementation of nutrient criteria for specific waterbodies across the country, installation of EPA's Beach Watch Website that provides the first national listing of beach water quality monitoring information, and development of watershed priorities through Unified Watershed Assessments. In 2000 and future years, federal agencies will continue to monitor progress toward key actions and the four major objectives of the CWAP—improve information and citizens' right-to-know, address polluted runoff, enhance natural resources stewardship, and protect public health. The Agencies will also be developing comprehensive performance measures to measure the net results of CWAP in future years, taking into account the fact that it usually takes a few years to implement improvements and to see the water quality benefits of those improvements.

TMDL PROGRAM: INTERNAL COST ASSESSMENTS

Question. EPA has reportedly done some internal cost assessments of anticipated revisions to the TMDL program. What are the Agency's current cost estimates, in terms of impacts on states and the EPA? How will the cost of the TMDL program

affect implementation of other core water quality activities? What state and EPA activities are being delayed or deferred as a result of current emphasis on TMDLs?

Answer. The Administration is still developing proposed revisions to the regulations governing the TMDL program required by Section 303(d) of the Clean Water Act. Part of this process involves estimating additional costs of complying with any revisions. A final determination on State costs has not been made.

The regulatory proposals are based on the consensus recommendations of a Federal Advisory Committee for TMDLs. Four State Environmental Department Secretaries or Deputy Secretaries were members of this Committee and signed the final report presented to the Administrator in July 1998. We expect to propose changes to the TMDL program in late summer 1999; we expect final regulations sometime next year.

EPA anticipates that the implementation of the current TMDL program can be borne by States and EPA with the support of the President's Budget proposal for fiscal year 2000, without either delaying or deferring other ongoing core water quality activities. The implementation of any final revised TMDL regulations will occur in later fiscal years. Working with the States, EPA has undertaken a water quality gap analysis project to examine the future funding that States need to effectively manage their water quality programs and will use that analysis to inform future budget requests.

TMDL: SOUND SCIENCE

Question. Stakeholders agree that sound scientific judgments are and will continue to be required for developing and implementing TMDLs. This includes scientific judgments as to the levels of pollutants that are safe for aquatic life in a waterway and calculation of the quantity of pollutants discharged that will not impair a waterway and how load limitations are allocated among sources. Yet many are concerned that needed technical and scientific information is inadequate. What resources is EPA devoting to assist states in this regard?

Answer. Resources supplementing State TMDL efforts are found in state water pollution control grants under Clean Water Act § 106, in § 319 state nonpoint source grants, and in EPA's operating resources. Section 106 grants, for which the Agency has requested \$115.5 million in 2000, support a wide range of water pollution control activities including permitting, water quality planning and standard setting, assessment and monitoring, and TMDL development and implementation. While EPA does not generally request (nor allocate to states, Tribes or interstate agencies) specific resource levels for the various eligible activities within the §106 budget, EPA's 1998 request did include an increase to support TMDL activities. We continue to emphasize the importance of establishing and maintaining adequate TMDL programs from within available §106 resources. Beginning in 1999, states are permitted to use up to 20 percent of their §319 allocation to upgrade and refine their nonpoint source programs and assessments. A prominent example of potentially eligible §319 activities is the development of TMDLs to help implement Watershed Restoration Action Strategies developed by states for high-priority watersheds. Aside from this direct state grant funding, EPA also requests resources to be used by EPA in direct and indirect support of states' TMDL efforts. At approximately \$15 million in the 2000 request, these resources support technical assistance on specific TMDLs, training of state personnel, development of national guidance and policy, and backstopping state efforts as necessary to meet TMDL development deadlines.

Question. How will EPA ensure the scientific soundness of TMDLs?

Answer. EPA is devoting a significant portion of its ecological research program to better understanding the levels of pollutants that are safe for aquatic life in a waterway, quantifying pollutant discharges from non-point and atmospheric sources, developing mathematical models that accurately calculate safe pollutant loads from point, non-point, groundwater, and atmospheric sources of pollution, identifying effective means for restoring aquatic ecosystems to sound health, and monitoring actual progress toward that goal. Specific examples include the development of biocriteria (indicators for determining the health of aquatic ecosystems based on the species present in the water body), landscape ecology (using satellite imagery to assess the impact on land use and land cover on non-point source pollutants to surface waters), the Environmental Monitoring and Assessment Program (EMAP) which is developing monitoring methods in Eastern U.S. coastal waters and inland waters in the Western U.S., as well as the Coastal Monitoring program, which has the potential for providing baseline information for TMDLs in estuaries. In addition, the Multimedia Integrated Modeling System (MIMS) will be a next-generation modeling system that will link air, water, groundwater, and biological models in highly realistic configurations.

More specifically, ORD is conducting near-term research on improving the scientific basis for setting TMDLs for sediment, nutrients, pathogenic organisms, and temperature. The results of this work will be incorporated into a nationally-applicable advanced problem-solving software framework that will permit easier use by the states, including automated links to land use, meteorological and aquatic organism effects data bases. This work is being conducted primarily in the Savannah River. Our scientists are also working directly with program offices to demonstrate cross-media TMDLs for mercury in Florida and Wisconsin. The completion of these regional demonstration models are anticipated within the next two years and the results will provide important feedback on our ability to apply these techniques nationwide.

Finally, EPA's Science to Achieve Results (STAR) program is supporting TMDL development through its Water and Watersheds partnership with NSF and USDA by soliciting research that will improve our understanding of watershed processes relevant to TMDLs and of analytical methods for determining how changes in the management of upland and riparian areas affect the quality of water bodies, especially with respect to mercury pollution, a widespread and growing pollution problem in more than half of the states.

EPA insures the quality of all of its scientific research through a rigorous process of peer review, both prior to initiating research efforts and of all research products. The STAR grants program relies on its competitive grants process to identify the very best researchers and research ideas.

STATE GRANTS: FISCAL YEAR 1999 FUNDING INCREASE

Question. EPA officials have said that the fiscal year 1999 funding increases for state grants (especially \$95 million additional for section 319 nonpoint pollution management grants) will be directed to projects in priority watersheds, as identified by states in watershed assessment reports prepared in 1998. However, because the time frame for preparing those assessments was very short from June to October 1, 1998), there is some question about their quality and thoroughness. What procedures will EPA use to oversee distribution of grant funds to priority watersheds to ensure that funds are targeted to those with highest need of restoration.

Answer. On December 4, 1998, EPA issued guidance on "Funding the Development and Implementation of Watershed Restoration Action Strategies under Section 319 of the Clean Water Act." The primary purpose of this guidance is to clarify the requirement for application of incremental funds to priority watersheds (i.e., those for which watershed restoration action strategies are to be developed). The guidance calls for a clear indication in each Section 319 workplan of "which grant activities will be implemented using the base funds and which projects will be supported by the incremental funds." Likewise, the guidance requires that "subsequent reports (e.g., grantee performance reports or annual nonpoint source progress reports under Section 319(h)(11) should similarly clearly distinguish these activities."

We are also using the Section 319 Grants Tracking System (GRTS), where states input detailed information about Section 319 grants, to include information specific to projects supported by the incremental funds. We are confident that the combination of extensive guidance, specific tracking, and continuing adherence by states to standard grant monitoring and reporting requirements will ensure the proper application of the incremental funds.

CHILDREN'S HEALTH

Question. EPA is planning to fund eight research centers that will help communities to reduce threats to environmental health. Other than research, exactly what kinds of activities are being funded in the communities by these centers?

Answer. EPA, NIEHS and CDC are supporting eight Centers for Children's Environmental Health and Disease Prevention Research, each of which will conduct multi-disciplinary basic and applied research in combination with community based prevention research projects designed to provide critical knowledge that will eventually help to decrease the prevalence, morbidity, and mortality of environmentally-related childhood diseases. All of the funded center projects are research activities. Five of the centers will research asthma; three will research health effects associated with pesticide exposure. A requirement for research funding for the centers is that each center support one project that develops, implements, and evaluates a community based intervention/prevention program. Community based prevention research studies are being designed with active community involvement and are primarily intended to develop and test the effectiveness and feasibility of various intervention strategies in reducing exposures to environmental contaminants that con-

tribute to childhood illnesses. In fiscal year 2000, EPA will support an additional research center, which will research developmental disorders.

The overall theme and nature of the community based prevention research activities for each of the eight established Centers are as follows:

ASTHMA CENTERS:

University of Iowa School of Medicine.—Theme: The Etiology and Pathogenesis of Airway Disease in Children from Rural Communities. Prevention Research Component (Rural Iowa communities): Multi-component Intervention Study of Asthma in Children from Rural Communities. The goal of this study is to develop, implement, and test a multi-component model for the prevention of asthma among rural children.

University of Southern California.—Theme: Respiratory Disease and Prevention. Prevention Research Component (Los Angeles): Asthma In Children: A Community-based Intervention Project will determine whether a comprehensive health education program using IPM techniques for cockroach control will result in reduction of dust mites or cockroaches in children's homes and clinical improvements in asthma.

Johns Hopkins University.—Theme: Asthmatic Child in the Urban Environment. Prevention Research Component (Baltimore, MD): Randomized, Controlled Trial of Home Exposure Control in Asthma will test the effectiveness of intervention methods to reduce hazardous exposures and their adverse health effects.

University of Michigan School of Public Health.—Theme: Environmental influences on asthma in children. Prevention Research Component (Detroit, MI): aim is to test methodologies that reduce exposure of children to environmental contaminants in their homes and neighborhoods that trigger asthma, thereby improving asthma related health status and reducing asthma-related medical care utilization.

Columbia School of Public Health.—Theme: Comprehensive community based assessment and reduction of environmental risks to infants and children. Prevention Research Component (South Bronx): Community-based intervention project will test: effectiveness of community education in raising awareness of environmental health risks and changing behaviors; effectiveness of maternal education in reducing exposure to secondhand smoke; effectiveness of household allergen reduction; and antioxidant dietary supplementation to reduce asthma-related biomarkers.

PESTICIDE CENTERS:

University of California at Berkeley.—Theme: Exposures and Health of Farm Worker Children in California. Prevention Research Component (Salinas Valley, Monterey County, CA): Initiate and evaluate the impact of a "Healthy Home" intervention on the reduction of pesticide exposure to children.

Mount Sinai Medical Center.—Theme: Environmental Toxicants and Neuro-developmental Impairment in Inner City Children. Prevention Research Component (East Harlem): The goal of the prevention research component—Growing Up Healthy in Harlem—is to test methodologies that reduce exposures of inner-city children and their families to pesticides in city housing through the technique of Integrated Pest Management (IPM) and reduce exposure to PBS through dietary modification.

University of Washington School of Public Health and Community Medicine.—Theme: Understanding the biochemical, molecular, and exposure mechanisms that define children's susceptibility to pesticides and the implications for assessing pesticide risks to normal development and learning. Prevention Research Component (Yakima Valley, WA): Reducing Take-home Pesticide Exposures in Children of Farm Workers

Question. What statutory authority has EPA identified for this overall [children's health] initiative? What authority do you cite for the activities related to the control of asthma?

Answer. EPA's Office of Children's Health Protection was established in 1997 in response to Executive Order 13045, which mandates that Executive Branch departments and agencies make children's environmental health and safety a priority. The role of the office is to promote and coordinate a variety of cross-media activities related to children's environmental health that are carried out by numerous EPA offices implementing many environmental statutes, which are identified below. Through the office, the Agency also has ongoing efforts to coordinate children's environmental health and safety activities with other Federal departments and agencies. Specific activities may be authorized by one or more of these statutes. The primary authorities for asthma related activities are specifically identified.

—Radon Gas & Indoor Air Quality Research Act (asthma)

—Clean Air Act, Section 103 (asthma)

- Toxic Substances Control Act, Section 10 (asthma)
- Federal Insecticide, Fungicide, and Rodenticide Act, Sec. 20 (asthma)
- Clean Water Act, Section 104
- Food Quality Protection Act
- Solid Waste Disposal Act, Section 8001
- Safe Drinking Water Act, Section 1442
- Pollution Prevention Act
- National Environmental Education Act

Question. Although there is some evidence that asthmatic symptoms are aggravated by air pollution, is there any scientific evidence that air pollutants, either criteria pollutants or hazardous air pollutants cause asthma?

Answer. While exposure to outdoor air pollutants is not currently thought to be a cause of asthma, evidence indicates that exposure to air pollution is associated with exacerbation of asthma-related symptoms. For example, increases in ambient ozone concentrations have been associated with increases in hospital admissions for respiratory causes for individuals with asthma, worsening of symptoms, decrements in lung function, increase in lung inflammation, and increased medication use (EPA-452/R-96-007, June 1996). Epidemiological research has associated increased incidence of adult-onset asthma for those individuals who have had childhood asthma, living in communities with higher long-term ambient ozone concentrations. (McConnell et al., 1999) Community epidemiology studies have also indicated that ambient particulate matter levels can be associated with altered lung function and increased respiratory symptoms in asthmatic patients, as well as increases in hospital admissions for asthma. (Thurston et al., 1997; Schwartz et al., 1994) Evidence for decreased lung function has also been found in chamber studies of mild asthmatics with exposures to environmental tobacco smoke. In addition, exposures to particulate matter or ozone have been shown to have a “priming” effect for responsiveness to allergens, with the pollutant exposure leading to heightened responses to allergens among allergic asthmatics (Koenig, et al., 1988; Kreit, et al., 1989).

House dust mites, cockroaches, mold and animal dander have been identified as the principal indoor allergens that trigger asthma symptoms. Reducing exposure to these allergens has been shown not only to reduce asthma symptoms and the need for medication, but also to improve lung function. Environmental tobacco smoke (also called secondhand smoke) is an important irritant that can trigger an asthma episode and possibly potentiate the effects of allergens.

Question. Does EPA plan to develop or distribute already developed educational material on asthma before NAS completes its study of the relationship between various environmental pollutants and asthma?

Answer. An asthma attack is one of several health endpoints that have been associated over the past several years with indoor air contaminants, including secondhand smoke and allergens such as dust mites, cockroach allergen, animal (i.e., pet) dander, and mold. There is consensus within the scientific community that reducing exposure to secondhand smoke and allergens should reduce the frequency and severity of respiratory illnesses in children, including but not limited to asthma. The National Asthma Education and Prevention Program (NAEPP) Expert Panel 2 Report (NIH Publication No. 97-4051, July 1997) specifically recommends avoidance of secondhand smoke and other allergens. Information developed by EPA and many other sources to help people make informed, voluntary decisions to reduce their children's (and their own) exposure to these and other contaminants is widely available and being widely disseminated through many different channels, including government, non-profit and industry networks.

The report is a follow-on study to a 1993 Institute of Medicine of the National Academy of Sciences (IOM/NAS) report on Indoor Allergens that helped to focus attention on the links between the growing problem of asthma and indoor air pollution. The study now being conducted by the NAS addresses only indoor pollutants rather than all environmental contaminants, and is scheduled to be completed in the Fall of 1999.

The NAS report is expected to help to consolidate an extensive body of already published scientific literature into a concise summary of what is, and is not, currently known about the role that indoor pollutants play in the induction and exacerbation of asthma. The report will include less studied contaminants such as pesticides, particles, nitrous oxides and other chemicals and irritants. While the report is expected to help further refine existing guidance and information on effective prevention strategies and identify critical information gaps, there currently exists a consensus among the scientific community that disseminating exposure reduction information will help protect children as well as adults from indoor contaminants.

CLEAN AIR PARTNERSHIP FUND: GRANTS TO CITIES

Question. EPA is requesting \$200 million for a new Clean Air Partnership Fund for grants to cities, states and tribes together with the private sector to demonstrate ways to reduce air pollution. How did EPA establish \$200 million as the amount requested for the fund?

Answer. EPA is requesting \$200 million in fiscal year 2000 for the Clean Air Partnership Fund based on years of discussions with potential grants recipients concerning the air quality improvement challenges they face. The \$200 million request will provide a significant new source of support for innovative, integrated air quality improvement demonstrations that currently are not being implemented.

OFFICE OF INFORMATION MANAGEMENT

Question. EPA has decided to create an office of information management, which is to be operational by the end of summer. Will this office have the authority including purse-string controls to compel other EPA offices to follow through on the policies and procedures it sets forth on disseminating EPA data? How will EPA overcome potential resistance to centralized policies, after 30 years of free reign for the individual program offices of data systems?

Answer. In October 1998, The Administrator made the decision to create a new information office as the result of recommendations made by an Agency-wide task force of senior managers representing both national programs and Regions. In making this decision, she accepted the position of the task force that the Agency and its stakeholders would benefit from more centralized responsibility for its information policy and activities. This broad internal consensus has enabled the Agency to move quickly to create a new organization that pulls the information life cycle into one place with a customer focus. It will provide a single, coherent, and coordinated strategy for information collection, management, use, and dissemination. It will have authority to review major investments in data collection and information technology and to develop and implement policy on key information issues such as data dissemination.

To better assure commitment to, understanding of, and compliance with the Agency-wide information policies that the Office will develop, the Deputy Administrator has been meeting regularly with Agency senior managers to develop a means by which the National Program Manager for information can meet directly with the senior leadership of the Agency on a continuing basis. This mechanism, while still being refined, will create a council of Assistant and Regional Administrator level leaders, staffed by the new information office, that will provide a forum to discuss and resolve information policy issues, develop effective strategies for policy implementation, and review progress in key areas.

OFFICE OF INFORMATION MANAGEMENT: IMPLEMENTATION PLAN

Question. EPA has not yet developed an information plan to show how the agency intends to achieve its visions and goals—even while the new office is supposed to be in operation in a few months. EPA has indicated it will have a plan at the end of September, after the office is operational. Shouldn't you have this plan in place before setting up the office? Will the plan lay out the EPA's information management priorities, and the resources needed to accomplish them? Can you tell us now what the priorities of the office will be?

Answer. The new information office will provide leadership to develop an information plan (technically referred to as an information architecture) for the information and information technology to support EPA's mission. Developing this type of plan at an Agency-wide level is a relatively new approach to information management across government and is very complex, but the value is clear: this planning approach provides a better mechanism to effectively and efficiently plan our information and technology investments on a multi-year basis. We will identify and coordinate information needs, with anticipated burden reduction for existing requirements, coordinate technology investments, and improve public access to and ability to use information from multiple sources.

As a first step in this effort, EPA will develop a high-level plan to define the information needed to support our public access mission. We will build upon the current work in identifying emerging information needs and opportunities for burden reduction to determine both priority information needs for public information and critical data needs for implementing EPA's programs. This approach will be coordinated with improvements in the Agency Strategic Plan and work on core performance measures under the National Environmental Performance Partnerships program. EPA will combine the results with other architecture planning processes across our

other mission areas as the new organization builds this capacity. We will then be in a position to identify high and low priority needs, opportunities to increase effectiveness and lower costs, make plans on a multi-year basis to acquire needed information and technology, and phase out unneeded or outdated information and technology.

Developing the Information Plan will involve many parts of the Agency not just the new Information Office. We will also work closely with our State partners and with all of our information customers to ensure that the Information Plan is something the Agency can and will use to improve our information practices to improve our service internally and externally. While the Plan will not be completed before the new Information Office is fully operational, its development will be one of the highest priorities of the new office. The Agency does not believe that the plan need be fully developed in order for the new office to begin its critical work. Indeed, the ability of the Agency to work through a single office to address all aspects of information collection, management and dissemination will help us develop an Information Plan that is of high quality and utility.

As we develop the Plan, we will be able to do an increasingly better job of setting information priorities that reflect an Agency-wide perspective, rather than a stovepipe, program-by-program perspective. We will also be working to identify the resources needed to accomplish those priorities.

In addition to developing an Information Plan, we have identified several important top-level goals for the new Information Office. These goals are:

Integrate information.—Increase the effectiveness of environmental information by better integrating and coordinating the information collected, its management, and its synthesis into products for decision-makers and the public.

Strengthen information partnerships.—Increase the extent and effectiveness of information partnerships, including leveraging information technology investments, to meet the needs of our varied information managers and customers. This starts with States and tribes, and extends to other federal, local, international agencies, and private organizations.

Enhance information quality.—Increase the value of environmental information for all stakeholders by seeking customer feedback and systematically improving its usability, clarity, accuracy and reliability. This includes development of compatible data standards and ensuring that quality is known and appropriate for intended uses.

Foster information-based decision-making.—Evaluate data and communicate its utility to improve environmental decision-making. Generate new trend and outcome information that promotes adaptive and forward-looking environmental management by decision-makers at all levels.

Reduce burden.—Increase the efficiency of information collection by reducing unnecessary EPA, State, and stakeholder cost and burden of collecting and using information

Strengthen EPA's information infrastructure.—Increase the efficiency, effectiveness and coherence of the information infrastructure. This involves strategic investment in technology, increasing the reliability (Y2K) and integration of installed technology, and enhancing information security.

Expand American's right to know about their environment.—Enable easy access to a wealth of information about the state of their local environment to expand citizen understanding and involvement and give people tools to protect their families and their communities as they see fit. Increased information transparency among scientists, public health officials, businesses, citizens, and all levels of government will foster greater knowledge about the environment and what can be done to protect it.

OFFICE OF INFORMATION MANAGEMENT: REPORTING BURDEN REDUCTION AND REI

Question. Among the many issues this office will address is reporting burden. Reducing the burden of reporting redundant or unnecessary information is important not only to the regulated community but also to regulators. What goals have been set for easing the reporting burden, especially for small businesses?

Answer. EPA seeks reporting burden reductions from three categories of respondents: (1) state partners reporting information to EPA, (2) regulated entities who report information to the Agency and the states, and (3) users of information provided by EPA. While efforts to reduce reporting obligations continue at the program level, we hope to identify larger burden reduction opportunities through implementation of the REI data standards and electronic reporting.

In addition, EPA and the states intend to critically examine the data needed for programmatic and public access purposes. EPA is creating an automated capability

to portray the full range of EPA reporting requirements. With this, EPA, the states, and regulated entities can get a better picture of reporting obligations, and can look at this burden sector-by-sector to identify burden reduction opportunities.

With respect to state reporting burden, EPA and its state partners are creating a process to explore burden reduction ideas on a state-by-state basis. We will make sure that reporting requirements yield high quality, needed information at the lowest possible costs. All of these efforts will pursue alternatives to current reporting approaches, including whole facility reporting.

EPA has adopted the Paperwork Reduction Act goal of reducing paperwork burden by five percent each year, although in recent years reductions have been offset by increases due to implementation of the Toxic Release Inventory, other right-to-know programs, and by new statutory requirements. EPA does not have a separate burden reduction goal for small business but does place a high priority on reducing or minimizing burden on them. EPA has begun a dialogue with a group of small business representatives to explore additional opportunities for reducing reporting burden and to ensure that REI and other reporting initiatives are well aligned with small business needs.

REI: DATA STANDARDS

Question. REI involves developing data standards, including a uniform identifier for a regulated facility. EPA has been trying to develop such a standard as far back as 1994. Why is it taking so long to develop this fundamental element for achieving the plan's stated data integration goal? What assurance can you give us that you will be able to meet the September 1999 target set for completing this and all other standards required by the plan?

Answer. The REI Facility Identification data standard was approved as an interim data standard in February 1998. Since that time, EPA has been working with states to refine the standard to ensure that it meets all of EPA's stakeholders needs. The final standard is scheduled to be issued by September 30, 1999. Business rules for implementing the standard are being developed in conjunction with the states.

This is a difficult data standard because it represents a fundamental change in the way EPA and the states conduct business. In addition to a standard facility identification number, the standard contains basic information about the facility such as name, address, locational information, and industrial classification. These data elements are defined, collected, and used differently by EPA programs and by each state. Reaching agreement of standard definitions and practices has required a long process of discussion and negotiation that is nearing completion.

The REI program was designed to provide the resources and management attention to standards development to ensure that they will be completed. EPA expects to meet the three year REI milestone for standards development and five year milestone for implementation in EPA information systems. Although some interim milestones have slipped, the entire data standards program is on track to complete development by December 31, 1999, more than one year ahead of the schedule in the REI Action Plan. Two of the six standards are already final and the other four standards have been issued as interim.

DATA QUALITY: ERROR CORRECTION PLAN STRATEGY

Question. A year ago EPA committed to putting together a strategy to ensure data quality, including an error correction process which is well-defined, efficiency (sic) and transparent. [Fred Hansen memo of Apr. 29, 1998] This still has not been done. When will EPA have an error correction plan in place, and will EPA discontinue the practice of not checking the accuracy of data before putting it on the Internet? Will EPA begin taking responsibility for the quality of the data it puts out, rather than simply blaming the sources from which the data came?

Answer. EPA's data quality strategy, which was developed in response to Fred Hansen's memo of April 29, 1999, includes a framework for an error correction process. On April 1, 1999, Peter Robertson, acting Deputy Administrator, wrote a memo accepting the strategy and restating the Agency's commitment to data quality. Responsibility for leadership on data quality rests with the new information office. The new information office, which is expected to be operational by September, 1999, will contain a quality staff and a quality board that will have overarching responsibilities for quality-related activities across the Agency. Implementation of an error correction process is a high priority for the new information office.

EPA does check the quality of data for which it has direct responsibility before putting it on the Internet. For example, Toxic Release Inventory (TRI) data, which is submitted directly to EPA by facilities, is put through rigorous quality control before being released to the public.

DATA QUALITY: STAKEHOLDERS INVOLVEMENT

Question. Will EPA begin involving stakeholders in discussions about plans to put information out, particularly for purposes other than that for which it was collected?

Answer. EPA is already involving stakeholders in plans to develop new information. For example, EPA's Center for Environmental Information and Statistics and the EMPACT program have routinely consulted stakeholders about their information needs, access preferences and feedback on proposed information products (e.g., EPA web site, CEIS web site and EMPACT project reports and communications).

In addition, EPA has committed to an Early Action Project for the new Information office which will address a number of issues relating to the development of new data and information products for release to the public.

The Agency will soon begin to engage states, tribes and stakeholders on issues such as prior notification of new products, processes for involving state partners and stakeholders in product development, and provision of metadata and interpretive context.

DATA QUALITY: STATES INVOLVEMENT

Question. Given that much of EPA's data comes from the states, what specifically is being planned with the states to ensure that EPA's information management and data quality plans are workable.

Answer. EPA is working with states through the Environmental Commissioners of States (ECOS). EPA is a partner with states on the ECOS Information Management Workgroup. The workgroup has developed a vision and operating principles and has chartered several teams to jointly deal with information management issues (e.g., facility identification). EPA will continue to work through ECOS and other mechanisms to ensure that information management and data quality plans are workable.

DATA QUALITY: FISCAL YEAR 2000 BUDGET REQUEST

Question. Specific funding requests could not be identified in EPA's budget for data quality and security concerns. How much of EPA's fiscal year 2000 budget request specifically would go to "data quality" and "information systems security"? What specifically is requested for fiscal year 2000 to address critical data gaps, and how does this compare to fiscal year 1999? What role will the new office play in identifying and prioritizing data

Answer. In fiscal year 1999 approximately \$175 thousand was used to address data gaps and in fiscal year 2000 approximately \$250 thousand will be needed to continue and build on the work relating to data gaps in the new Information Collections Office. The fiscal year 2000 Office of Information Resources Management security budget is \$1,481 thousand.

The new Information Office will integrate various aspects of information management, policy and technology at EPA. Although the Agency's program offices will retain many of their information responsibilities, the new office will lead the creation of a coordinated and consistent policy and information framework. One area in which this coordinated and consistent policy function will apply is in the identification and prioritization of data gaps. A critical step in addressing data gaps is the development of an information plan which will serve as an architecture for the information and information technology necessary to support EPA's mission. In part, the information plan will determine both priority information needs for public information and critical data needs for implementing EPA's programs. Working with the offices across the Agency, our state partners and all of our information stakeholders, the new Information Office will have the lead for developing the information plan. The information plan effort will build upon current work in identifying emerging information needs and opportunities for burden reduction.

DATA QUALITY: COMPUTER SECURITY CENTRALIZED VALIDATION PROCESS

Question. With respect to computer security concerns, when will EPA establish a centralized validation process to ensure required aspects of the information system security are properly planned for and documented throughout the Agency, as recommended by the Inspector General?

Answer. In response to the Inspector General's recommendation to establish a centralized validation process, EPA agreed to require its Primary Organization Heads (Assistant Administrators, Regional Administrators, the Chief Financial Officer, the General Counsel, and the Inspector General) to certify their security planning activities annually to the Chief Information Officer. Primary Organization Heads certify that workable information security plans have been implemented. To

make this decision, Primary Organization Heads rely on EPA's Senior Information Resource Management Officials (SIRMOs) to first approve in writing that each security plan adequately addresses the security controls required for the protection of the general support system or major application. Prior to approving security plans, SIRMOs are responsible for ensuring that independent reviews are conducted for each plan.

DATA QUALITY: EMPACT INITIATIVE FUNDING

Question. EPA has requested funding under EMPACT for a "state of the art scientific information system" that it identifies as currently in development (p. VII-6). Please explain this initiative and the specific funding request associated with it. Also, how much is being spent in this and prior fiscal years on this effort? Will additional funds be needed in the outyears?

Answer. While EMPACT and work to develop a state-of-the-art scientific information system both are captured under the Agency's Empowerment Goal, the information system is not a part of the EMPACT program. The effort to develop a scientific information system resulted from a 1997 Office of Research and Development (ORD) commitment to improve the coordination of its science information management activities. The ORD publication, "Strategic Plan for ORD: Information Management Component", published in 1997, sketched out several management options that could be employed to achieve ORD's information management goals and objectives. Of these, ORD management selected the development of a Science Information Management Coordination Board (SIMCorB) as the preferred option. On the SIMCorB are representatives from each of ORD's research laboratories and centers.

One of the first activities undertaken by SIMCorB was the development of an implementation plan that would modify EPA's research environment so that strategic information management (IM) goals would be met. Project plans were developed in four areas, one of which was development of a Science Information Management System (SIMS) to support Agency science activities.

The Board evaluated existing IM activities and systems and determined that an existing IM effort, the Environmental Information Management System (EIMS)¹, formed an appropriate foundation upon which to build the SIMS.

In fiscal year 2000, EIMS will begin its modification to become SIMS, with system augmentation continuing through 2003. Eventually, SIMS will be the foundation of the research electronic "collaboratory". Through SIMS, individual investigators located anywhere in the Agency's research laboratory system will be able to participate in all the activities of the science project life cycle (communication, planning, analysis, publication and archival) as if they were collocated.

The following table reflects the four-year research and development investment in this activity under the Agency's Empowerment Goal. Figures represent estimates through the fiscal year 2000 President's Budget Request. We expect to provide out-year support for system augmentation under the base research program.

[Dollars in millions]

	Fiscal year			
	1997	1998	1999	2000
EPA/ORD	\$0.1	\$0.4	\$0.4	\$0.4

DATA QUALITY: CERCLIS

Question. Beginning in 1990, concerns have been raised by the I.G. as to the quality of data contained in CERCLIS database. EPA staff still must verify the accuracy of data used for the mandated Superfund annual report because CERCLIS data still cannot be relied on. Why is it taking EPA so long to correct this problem?

Answer. Earlier reviews by the OIG did indicate some data quality issues with the CERCLIS database, but their recent work in this area has documented considerable improvements. In 1990, the OIG issued an audit report "CERCLIS Reporting" and a subsequent follow-up report in March, 1992, "Special Review on Follow-Up of CERCLIS Reporting and Post-Implementation", which included numerous rec-

¹ EIMS stores and maintains descriptive information about documents, datasets, databases, models, images, web pages and multimedia products in a relational database. Descriptive information stored within EIMS is consistent with the Federal Geographic Data Committee (FGDC) metadata content standards for spatial data. EIMS is scheduled to become a node of the National Spatial Data Infrastructure (NSDI) during the summer of 1999.

ommendations to improve the quality of data and reporting of information through the CERCLIS database. Through 1993, EPA took corrective actions which improved report program documentation, enhanced the CERCLIS report library central coordination effort to more effectively monitor the change control process, and established a third party testing team and new testing procedures.

During the OIG's review last year of the fiscal year 1995-97 Superfund Annual Reports to Congress (SARC), the OIG implied that numerous discussions between Headquarters and Regional staff were needed to verify the accuracy of CERCLIS data. This statement was also included in the OIG's January, 1998 response back to Dick Armey's August, 1998 request of the OIG's Top Ten Concerns at EPA. However, the OIG was not aware that the data used for the SARC originated from a frozen database for the specific year being reported. Although the SARC's are being issued late, the data sets included in the reports were unchanged from the frozen database of the reported year. The OIG subsequently understood this process, and issued their final report without any criticism of the quality of CERCLIS data. On the contrary, the OIG's final report praised EPA for having adequate controls over data entry procedures into the CERCLIS database. The OIG also cited their December, 1997 audit "Superfund Construction Completion Reporting", in which they stated "that the source documentation supported 100 percent of the construction completion accomplishments, one of the Agency's main indicators of site progress. The information EPA reported was accurate, and Congress and the public can rely upon the information."

Question. What specifically is planned for fiscal year 2000?

Answer. We will continue our ongoing data quality efforts on CERCLIS which consist of the following: supporting the designated data sponsors through national work group meetings, participating in the biweekly data quality conference calls, organizing national meetings with the Information Management Coordinators where data quality issues are identified and discussed, and enhancing the CERCLIS system with features that support data integrity, i.e., Smart Screens which help the user correctly identify the required data.

Question. When can the concerns the I.G. has identified be resolved?

Answer. The OIG's concerns have been resolved based on the OIG's final report which contained no criticism of the quality of CERCLIS data but rather praised EPA for having adequate controls over data entry procedures into the CERCLIS database. Through 1993, EPA took corrective actions which improved report program documentation, enhanced the CERCLIS report library central coordination effort to more effectively monitor the change control process, and established a third party testing team and new testing procedures.

DATA QUALITY: RCRIS

Question. In 1993 the I.G. reported that EPA's RCRIS system did not contain accurate and timely information. There continue to be problems, 6 years later, as outlined in 3 1999 OIG reports. Since RCRIS data accuracy problems have been long recognized and RCRIS is an important information system, what is EPA doing to finally improve RCRIS?

Answer. The Office of Solid Waste and Emergency Response (OSWER) is committed to using RCRIS as the sole source of data to monitor progress towards the GPRA goal of safe waste management for hazardous waste facilities. Working with the EPA Regional offices, we have initiated a series of efforts to improve both the data system and the data it contains. Significant improvements have already been made, and more are expected, in particular toward the end of 1999.

Our first step, starting in 1998, was to have a team work with Regional contacts (the Regions in turn worked with the States) to establish and verify a GPRA baseline "universe" of operating permit and post-closure facilities in the RCRIS database. Our approach involved revisions to the data system parameters followed by two rounds of checking the data, and identifying and correcting discrepancies. These efforts resulted in a significant improvement in the quality of the RCRIS data showing what facilities are in the GPRA baseline universe.

With the GPRA baseline defined, we are currently working with our Regional contacts to further refine a method to use RCRIS to accurately determine progress towards GPRA goals. Once these refinements are incorporated into RCRIS, the Agency will clean up the unit-specific data in RCRIS. Correcting the unit-specific data is a significant undertaking which should result in a major improvement in overall data quality.

RCRIS is also an accurate and up-to-date source of national information on Corrective Action activities and results. Over the last two years the accuracy of Corrective Action information has been materially improved by focusing our maintenance

efforts on a few key areas and ensuring that implementers get feedback on the quality of their data.

Tim Fields, Acting Assistant Administrator for OSWER, recently issued a memorandum to the Regional Administrators entitled "Improving the Accuracy of RCRA Corrective Action Program Data" (2/11/99). This major effort is largely completed and significant improvements in the RCRIS data can be seen currently. Since a significant amount of the RCRIS corrective action data is implemented by States, prior to issuing the memorandum a meeting was held in cooperation with Association of State and Territorial Solid Waste Management Officials (ASTSWMO) to include all States with significant influences on national RCRIS data quality and have them participate in the collective effort to improve the quality of RCRIS data. Additionally, to focus and increase the effectiveness of the RCRIS cleanup efforts the corrective action program identified a limited number of key program activities (Environmental Indicators and other key program milestones) that need to be cleaned up and maintained through time.

Our Environmental Indicator (EI) codes (our sole measures for GPRA) are relatively new and are constantly being used to illustrate the progress in specific Regions and States. Over the last year graphical charts which directly compare Regional and State EI results to their neighbors have been made available to Regional and State regulators. These graphs have significantly increased the recognition of the importance of having accurate national data and have resulted in significant improvement in, and increase of, RCRIS EI data. We are planning increased public access and awareness of corrective action EI progress through the use of Regional/State maps showing facility locations that are linked to RCRIS records showing EI status. The corrective action Program is using only national RCRIS data for annual planning, and for giving credit for accomplishments. This approach helps ensure the accuracy of the national RCRIS data.

In addition, modernization of current systems is underway to make data more directly accessible to program personnel via the Internet. Key management reports are already available to EPA and States now, and additional features are in development with implementation to be completed by May of 2000.

Finally, OSWER in conjunction with other EPA offices, is working with States to assess future information needs through the Waste Information Needs initiative (WIN). This is a multi-year process to evaluate stakeholder requirements and ensure senior management direction for future investment in new technology and prioritization for data collection and quality.

The Office of Enforcement and Compliance Assurance (OECA) is nearing completion of Quality Management Plans (QMPs) for the compliance and enforcement data contained in RCRIS. The QMP will consist of: Data Quality Objectives (DQOs), that identify the level of quality needed to support OECA decisions; a Quality Assurance Project Plan, which ensures that data meets the standards set by the DQOs; Standard Operating Procedures for collection and quality assurance of the data used to support OECA decisions; and a Baseline Data Audit, to be used as a baseline from which we will measure progress toward improved data quality.

OECA is proposing to embark on a multiyear modernization effort to integrate core compliance and enforcement data from each media program, into a single data system. This effort, which is contingent upon receiving Agency funding, would ensure that hazardous waste compliance and enforcement data is integrated with other media data on a common platform with as much definitional standardization as is practicable.

DATA QUALITY: STATE WATER QUALITY ASSESSMENT REPORT

Question. Recently issued OIG reports and ongoing audits found that state water quality assessment reports were not complete, accurate and timely. The state reports are entered into EPA's STORET database, which is the basis for the national report on water quality. What plans does EPA have to work with the states to address these problems.

Answer. Many States enter into STORET the actual water quality data they use in developing the assessments they provide in their State 305(b) reports. In developing the national report on water quality, we analyze and summarize the State assessments provided in their 305(b) reports rather than generate the national report from the STORET data base.

EPA continues to work with the States on the quality and national consistency of their 305(b) reports. For the first time, in 1998, all 50 States submitted 305(b) reports. Both EPA and the States recognize the continuing need both to improve the quality of the assessments and to increase the number of actual waterbodies monitored over time. Working with the States, EPA issued new 305(b) guidance in 1997

that should help improve both the State 305(b) reports and the national summary report generated from the State reports. Improvements will include more comprehensive coverage of waters and georeferencing of 305(b) information to identify and map specific waterbodies, including whether they meet water quality standards, and to enable long-term tracking of trends. As it usually takes at least one full reporting cycle for the States to incorporate new guidance into their operations, we hope to see improvements starting with the year 2000 State and national summary 305(b) reports. EPA will continue to work with the States on the implementation of this new guidance.

In the fiscal year 2000 President's Budget, EPA continues its \$20 million investment in Section 106 Grants so that states and tribes have more resources available for monitoring activities to reduce point and nonpoint source pollution, including permit issuance for CAFOs and assessment improvements.

DATA QUALITY: GRANT MANAGEMENT

Question. Numerous IG reports, Congressional hearings, and your own annual certification to the President under the Federal Managers' Financial Integrity Act have identified serious grants management problems at EPA. While the agency plans next year to work on closing out the backlog of thousands of inactive grants, EPA has yet to change the way its grant officers do business. What steps are you taking to change the way EPA personnel do business and prevent further mismanagement of grants funds? What incentives do EPA staff have to ensure that grant agreements are followed? Are additional incentives needed, and if so, what form would they take?

Answer. The Agency has taken a number of significant actions to ensure proper management of grants. The Agency has implemented a policy which requires employees to be trained and certified before serving as a Project Officer for an assistance agreement. The Agency has trained over 4,000 employees over the past five years.

The Agency has strengthened the training provided to program office staff, placing greater emphasis on post award management in the Agency's Assistance Project Officer Training Course. In addition, EPA has developed and is conducting a refresher course which addresses new grants management issues and provides information on our website and automation tools.

The Agency has developed several policies for grants management and program office staff to strengthen grants management. For example, the Agency issued a closeout policy to address non-construction grant backlog and to eliminate future backlogs. This policy requires each Grants Management Office to identify specific impediments to grant closeout and develop an annual plan to address these barriers.

Also, the Agency has issued post award management policies for the Grants Management Offices and headquarters and regional program offices to clearly define performance expectations, accountability, and guidelines for post award management. The policies also require the development and implementation of post award management plans that addresses the unique requirements of each organization.

Various post award monitoring activities of grant recipients continue to be conducted. Monitoring activities include baseline monitoring (day-to-day monitoring activities under all grants); on-site evaluative visits (evaluation of specific grants and grantee financial, procurement, systems); on-site technical assistance; technical assistance conferences and workshops (Agency Outreach); and desk reviews. Also, on a biennial basis the Agency conducts Management Effectiveness Reviews (MERs). All regional and headquarters program offices conducted a self-assessment review of their assistance activities to identify potential vulnerabilities and areas for improvement. The first MER occurred in 1997, and Offices and Regions are now conducting their 1999 MERs.

The Agency continues to conduct management oversight reviews (MORs) of the Grants Management Offices to assess how they are managing their grant operations. As part of these reviews, the MOR review team will conduct an assessment of post award management and closeout plans.

Information resources management and technology in the assistance area have been increased. All assistance-related policies have been placed on the Agency's Intranet. Grants management and program office staff may monitor grant expenditures on their projects electronically. The Agency may access the Single Audit Clearinghouse database at the Department of Commerce Bureau of Census. This electronic capability helps in the post award monitoring and management of grants.

The original closeout backlog of non-construction grants has been reduced by 95 percent and EPA will eliminate the closeout backlog by the Congressional deadline of July 2000.

Moreover, the Agency continues to work in partnership with the Inspector General to identify specific grant or grant program areas for audit where we have questions (e.g., grantee financial management systems, practices, or performance).

Assistance agreements with our environmental partners are a critical component of meeting the Agency's public health and environmental goals and objectives. To demonstrate the importance of ensuring that grants are managed and fulfill our environmental mission, EPA has developed tools for both programs and staff. First, each Program and Regional Office has been asked to develop and implement post award management plans. These plans will be coordinated and assessed by the national program manager for grants. All programs and regions also conduct self assessments biannually to ensure that grants are effectively managed in their organization. Second, the Agency is working with staff (both program and grants) to ensure they have the training and tools to perform their jobs. Employees must be trained and certified before serving as project officers. In addition, EPA is developing automation tools such as the Integrated Grants Management System to reinvent and strengthen grants management. The Agency believes that this approach (better trained staff, stronger grants oversight, and automated systems) will advance the Agency's public health and environmental mission.

Grants managers in the Agency will be working with the Office of Reinvention to identify additional incentives and opportunities for streamlining which will result in strengthened grants management.

GRANTS MANAGEMENT: POST AWARD MANAGEMENT POLICY

Question. Each year EPA has reported in its Integrity Act report that it has extended by another year the date it hopes to correct the grants problems. And, the fiscal year 2000 Budget Request indicates EPA has yet to develop a policy addressing post-award management of grants even though the Agency committed to issuing this policy in 1997. What hasn't this been a higher priority?

Answer. EPA has been working steadily over the last four years to strengthen grants management and has made considerable progress. One of the Agency's highest priority in addressing grants management issues was to develop and implement a policy that required training. Over the last five years, the Agency has trained over 4,000 project officers, and we recently developed a refresher course which addresses new grants management issues and provides information on websites and automation tools.

The Agency has also developed new policies addressing closeouts and post award management for both the grants and program offices. In addition to developing new policies, the grants offices have initiated various oversight and assistance reviews with grantees.

The Agency has made significant progress to eliminate the closeout backlog of non-construction grants. Overall, the Agency has eliminated approximately 95 percent of the original backlog of nearly 20,000 and is committed to eliminating the non-construction grants closeout backlog by July 2000 as announced by the Deputy Administrator at a July 1996 Congressional Hearing.

In addition to the focus on training, policies and procedures, and closeouts, the Agency has made a commitment to streamline and reinvent the grants process by developing and implementing a paperless, programmatic and administrative system, which fully automates the grants process. The Integrated Grants Management System will strengthen our relationships with our environmental partners, enhance our post award and closeout management, and improve the speed and user-friendliness of the grant process.

GRANTS MANAGEMENT: STATUTORY AUTHORITY

Question. This past September, EPA's Inspector General found that EPA lacked statutory authority for 44 percent of the grants the IG reviewed. In one area, the IG found that EPA was awarding grants for economic development studies, environmental justice and technical assistance under a research provision of CERCLA. What is EPA doing to correct this major deficiency?

Answer. In September 1998, the Office of Inspector General issued audit report E3AMF8-11-0008-8100209 entitled Statutory Authority for EPA Assistance Agreements. The OIG recommended that the Agency obtain clarifying authority to fund assistance agreement activities questioned in the audit. The Agency has received clarifying authority in the fiscal year 1999 Appropriation for Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) Section 23 which authorizes assistance to

States and Indian Tribes for cooperation, aid, and training. The Agency has also requested clarification of FIFRA Section 20 (assistance for research and monitoring activities) and the Toxic Substances Control Act (TSCA) Section 10 (assistance for research, development, collection, dissemination, and utilization of data) in the fiscal year 2000 President's request to Congress. The Agency is also requiring documentation in the decision memorandum which explains how the proposed workplan relates to the authorizing statute. The Agency has completed action on the OIG recommendations and the audit has been closed.

COMPLIANCE ASSISTANCE

Question. EPA is requesting only \$19 million for compliance assistance activities. This is a reduction of almost \$5 million below the current level. While EPA professes to believe these programs are important—and despite that these programs have been very successful in helping small businesses comply with complex environmental regulations—they have been held at roughly \$20 million for many years. According to your budget (p. IX-30), compliance assistance is being cut “with the expectation that the states will assume a majority of this work in 2000.” Wouldn't it be wasteful for 50 states to develop compliance tools for the same rules, and unrealistic to expect states or private entities to develop these tools when EPA is the interpreter of its own rules?

Recent documents EPA has put out suggest EPA believes these programs are quite effective, and I understand EPA has taken some steps to quantify the effectiveness of these programs. Is this true, do you agree they are effective, and if so, why is EPA proposing to cut the programs?

Answer. Rather than indicate a shift in program emphasis, the apparent decrease in resources requested in the fiscal year 2000 budget for compliance assistance reflects how our regional resources have actually been used between compliance assistance and enforcement. Results from a recent study of the compliance assistance and enforcement work done in the Regions prompted OECA to revisit the methodology used to estimate the regional resources dedicated to compliance assistance activities. We learned that our previous methodology identified more workyears providing compliance assistance than were actually doing this type of work. We intend to continue what we believe has been a strong and innovative compliance assistance program.

EPA's role has been and continues to be to develop and distribute compliance assistance information and tools for business and industry. As the primary providers of direct assistance to the regulated community, states and localities and other compliance assistance providers use or adapt EPA compliance assistance materials to reflect specific state or local requirements. We believe this relationship has been very successful in improving the regulated community's awareness and understanding of its environmental obligations. We intend to expand these outreach efforts by working more closely with compliance assistance providers, especially with state and local governments.

Participants at our recent conferences on EPA's compliance programs confirmed the value of EPA's compliance assistance tools and materials and urged us to continue developing general compliance assistance tools that are widely applicable and that are made widely available through the Internet, toll-free hot lines and other appropriate channels. We also heard strong support for the view that states are the first-line, on-site purveyors of compliance assistance. EPA is continuing to work with the states and other assistance providers to develop a strong network that exchanges information and tools and minimizes duplicate services.

We believe that our compliance assistance tools have increased the regulated community's understanding of environmental requirements. For example, working with industry associations and other organizations, we have set up nine Compliance Assistance Centers through Internet web sites, toll-free telephone lines, and fax mail, each directed toward a specific industry or government sector. During 1998, the five existing Compliance Assistance Centers logged over 190,000 user sessions and responded to over 3,600 toll free phone calls and questions via e-mail. In addition to the Centers usage, EPA Regional offices in fiscal year 1998 collectively reached almost 250,000 regulated entities through compliance assistance outreach mechanisms including telephone hotlines, workshops and training sessions, on-site visits and compliance assistance tools. Notable examples of these tools include the 28 sector notebooks, which are industry sector profiles containing information on the overall compliance history, applicable federal requirements, industrial processes, pollutants generated, pollution prevention approaches, and cooperative programs designed to improve the environmental performance of the industry. Since 1995, over 300,000 copies have been distributed in printed and electronic form. Moreover, eighteen

plain language guides and several compliance checklists have been prepared for selected sectors, including the food processors, paints and coatings, and automotive sectors.

GAO: SUPERFUND PROGRAM

Question. Superfund/GAO has continued to list the Superfund program as a high-risk program, subject to fraud, waste and abuse. GAO cites concerns in the area of inadequate contractor oversight, overcapacity of contractors, cost-recovery concerns, and other issues. What specific actions is EPA taking to ensure that next year, Superfund is not on the list of high-risk programs?

Answer. As indicated previously to GAO, the Superfund program continues to maintain a high level of regional and headquarters management attention and oversight over its contracts. Over the past few years, EPA has strengthened management over its Superfund contracts and has taken steps to assure that it has the appropriate contracting capacity to meet present and future cleanup requirements. Some of the specific steps we have taken include: (1) reduced the number of contracts from forty-five Alternative Remedial Contracting Strategy (ARCS) contracts to nineteen Response Action Contracts (RACs), (2) reduced the base level of effort hours in several of the more recently awarded RACs (e.g., in Regions 2, 3, 9 and 10), (3) reduced the number of new RACs awards in Regions 4, 9 and 10 to one per region, instead of two per region, and (4) transitioned work efficiently and expeditiously from expiring ARCS contracts to new RACs. In addition, we are monitoring national RACs capacity utilization on a continuing basis and developing quarterly reports for senior management review. These reports have shown an overall positive trend with more technical work being ordered through RACs and program support cost percentages decreasing. Finally, we are taking steps to assure that decisions to exercise options to extend the periods of performance under RACs are based on sound programmatic and business considerations and well documented both in the regions and at headquarters.

In the cost recovery area, GAO has focused on indirect cost rates and performance measures for the cost recovery program. GAO has consistently noted that, because of the indirect rates that are being used, EPA is unable to recover most of its indirect costs. GAO also notes that EPA's existing cost recovery measures are inadequate, and suggests the development of another measure.

In 1982, the Agency established a very conservative methodology for charging indirect costs to sites for possible cost recovery, because CERCLA statute was not explicit on recoverability of indirect costs and EPA has had to rely on case law to clarify the statute.

EPA attempted to further clarify its authority and be more aggressive in recovering indirect costs in a 1992 proposed rule. That effort was withdrawn when the proposal drew significant opposition on numerous issues including the proposed indirect rate methodology. At the same time, Congressional committee members were also critical of EPA for not using its enforcement discretion, such as providing orphan share at sites with non-viable parties or parties with limited ability to pay, to improve the fairness of the Superfund program.

EPA began a second rule making effort in 1995, just before becoming aware of OMB's new government-wide cost accounting standards (July 1995). Because the OMB standards provided both methodology and authority, EPA decided to revise the indirect rate methodology using the new Federal cost accounting standards.

EPA has provided GAO with a draft of the revised methodology and is awaiting GAO comments. The new methodology is also being reviewed by a private accounting firm to ensure that it is consistent with the new standards. The new methodology is expected to be operational in early 2000.

In response to prior GAO recommendations, in 1994 EPA established a new performance measure requiring cost recovery Statute of Limitation (SOL) cases to be addressed in a timely manner. To do this EPA establishes site specific annual targets for all cases with total costs greater than \$200,000 and SOLs that will expire during the upcoming fiscal year and beyond. Regions are not required to address all SOL cases and are encouraged to bring additional cases each year particularly where PRP financial viability may be changing or high dollars are at stake. A majority of the cost recovery cases are removal actions which are addressed within 3 years of removal completion. Cost recovery for remedial actions is generally pursued after the remedy is selected. If parties do not agree to conduct the response or pay past costs, EPA generally brings a cost recovery case within 2-3 years of the initiation of the remedial action.

EPA currently uses a variety of "tools" to manage the enforcement program. EPA reduces the need for cost recovery by maximizing the number of PRP conducted

cleanups, the value of PRP cleanups since the inception of the program is approximately \$13.1 billion. The Agency has been very successful at this, compelling PRPs to conduct more than 70 percent of new cleanup work at NPL sites. The overwhelming success rate for cases that are brought indicates that cases are being filed in a timely manner and that they are well documented.

Question. How high a priority is this for EPA?

Answer. OSWER declared the contract issue an Agency-wide weakness in its fiscal year 1997 Annual Assurance Letter through the FIMFIA process. The corrective actions and progress made to address these issues are regularly monitored by OSWER's Assistant Administrator.

GAO: CONTRACT CAPACITY PROGRAM SUPPORT COSTS

Question. The General Accounting Office in its testimony today states that the Environmental Protection Agency has too much contract capacity and is spending too much in program support costs as a result. The Environmental Protection Agency spends on average about 28 percent of total costs, compared to the Environmental Protection Agency's target of 11 percent. What are the Environmental Protection Agency's plans to address this and make better use of Superfund resources?

Answer. The Office of Solid Waste and Emergency Response has taken steps to assure that the Superfund program has the appropriate contracting capacity to meet present and future cleanup requirements. Specifically, we have (1) reduced the number of contracts from 45 alternative remedial contracting strategy contracts to 19 response action contracts, (2) reduced the base level of effort hours in several of the more recently awarded response action contracts in Regions 2, 3, 9, and 10, (3) reduced the number of new response action contracts awards in Regions 4, 9 and 10 to one per region, instead of two per region, and (4) transitioned work efficiently and expeditiously from expiring alternative remedial contracting strategy contracts to new response action contracts.

In addition, we are actively monitoring national response action contracts' capacity utilization on a continuing basis and developing quarterly reports for senior management review. We will issue a national policy on response action contracts' options analysis in June 1999, which will outline guidelines in assessing the exercise of response action contracts' options. These guidelines will assure that Agency decisions to exercise options to extend response action contracts are based on sound programmatic and business considerations, and are well documented both in the regions and at headquarters.

As we previously indicated in our comments on the General Accounting Office's draft report, we are concerned that the General Accounting Office's findings on program support costs may be overstated. The General Accounting Office's analysis included two newly awarded contracts and three additional contracts that had been in place for only a year or less. At the time of the General Accounting Office's review in September 1998, the Agency did not have sufficient time to assign substantial technical work to these contracts. Since that time, our management reports have shown a positive trend, both in terms of reductions to program support percentages and increased contract capacity utilization for these contracts; this is also true for response action contracts overall. In several cases, the regions have used innovative methods, such as fix pricing their program support work assignments, to lower their program support costs. We continue to believe that as more technical work is ordered through response action contracts, the program support percentages will decrease.

Question. The General Accounting Office says, Our reviews over the years have consistently shown that without sustained high level management attention, the Environmental Protection Agency has not always succeeded in implementing and sustaining contract reforms. Will the Environmental Protection Agency leadership make Superfund contract improvements a top priority?

Answer. With much effort on the parts of both the program/regional and contracting personnel, the Environmental Protection Agency continues to make many positive steps to improve our contract management. The Environmental Protection Agency senior leadership has and continues to make Superfund contract improvements a top priority. The Office of Solid Waste and Emergency Response had previously developed a corrective action strategy and milestones relating to independent Government cost estimates as part of the fiscal year 1998 Integrity Act process. We believe that completion of these milestones will serve to improve the quality of independent Government cost estimates.

The Agency's senior managers continue to focus attention on any areas that represent potential vulnerabilities in contract management. In order to ensure that the Agency relationship with its contractors remains an appropriate one, the senior

managers agreed that the following steps will be taken during fiscal year 1999: (1) program/regional offices would identify all contracts where the contractor is working at a Government facility and evaluate whether this was appropriate and necessary, and if not, relocate the place of performance to an off-site location; program/regional offices would determine, which, if any, of their contracts were most susceptible to improper personal relationships, programs/regional offices would perform management effectiveness reviews on those with the greatest risks.

Additionally, the Office of Administration and Resources Management/Office of Acquisition Management is also launching two new initiatives to improve Superfund contracting. The first initiative will require contracting officers to specify the Environmental Protection Agency's requirements in more performance-focused terms rather than the Environmental Protection Agency long practiced method of specifying the professional and technical level of contractor personnel assumed to be required to accomplish the contract mission. The second initiative will prohibit the specification of program management costs as a separate cost element, unless the contractor can demonstrate that this method of charging is consistent with its normal accounting practice. The Environmental Protection Agency hopes to build on these initiatives in the future with additional initiatives.

Lastly, the Environmental Protection Agency has recently taken steps to revitalize the Superfund Senior Regional Management and Acquisition Council. The Superfund Senior Regional Management and Acquisition Council is a bi-annual conference, co-chaired by the Office of Solid Waste and Emergency Response and the Office of Administration and Resources Management/Office of Acquisition Management to promote quality in contracts management, share Regional successes, and new ideas for managing Superfund contracts, and resolve cross-cutting acquisition issues. Participants on the Superfund Regional Management and Acquisition Council are generally one senior representative from each of the Region's Waste Management Divisions, Environmental Services Divisions and the Assistant Regional Administrator for Planning/Policy and Management Offices. Headquarter offices that are represented include the Office of Solid Waste and Emergency Response, the Office of Administration and Resources Management, Office of Enforcement and Compliance Assurance, and the Office of the Inspector General. The Superfund Senior Regional Management and Acquisition Council provides guidance and direction to those Superfund program managers implementing recommended improvements in Superfund contracts planning procurement, and management processes that promote consistent approaches to managing high quality cleanup projects.

Question. How will the Environmental Protection Agency use the Contracts 2000 initiative to address some of the recurring contract management issues the General Accounting Office has identified and what re the specific time frames for implementing improvements through Contracts 2000?

Answer. The Environmental Protection Agency agrees that the Contracts 2000 effort is a very important strategic initiative. Contracts 2000 is a strategic planning effort to develop the structure of the Superfund contracting program following the Long-term Contracting Strategy. Phase I, the strategy, was completed with the issuance of a decision memorandum signed by Tim Fields, Acting Assistant Administrator, Office of Solid Waste and Emergency Response, and Betty Bailey, Director, Office of Administration and Resources Management/Office of Acquisition Management on February 5, 1998. We will issue the Contracts 2000 Strategy Report in June 1999, which will expand on the issues and decisions that support the strategy outlined in the memorandum.

The implementation phase began in February 1998. The implementation work group has been developing the implementation plans that each region will submit for management approval. The workgroup has also considered ongoing acquisition initiatives, such as performance based contracting and multiple award contracting. Sub-work groups began developing the statements of work for those classes of contracts expiring by the end of fiscal year 2000.

We will issue the Contracts 2000 Implementation Framework in June 1999. The framework will include the roles and responsibilities for reviewing and approving regional Contracts 2000 implementation plans, and the components that need to be addressed by these plans, such as implementation charts, acquisition strategies, and timetables. Contracts Class Implementation charts, showing the number of contracts, size, and type for each region, and the structure and management of the contracts, will be published throughout the 1999 year as they are approved by the Environmental Protection Agency management.

Question. Is the Environmental Protection Agency working to develop new and more effective ways to build more competition into the Environmental Protection Agency's contracting process? Please describe.

Answer. In some classes of Superfund contracts, the Contracts 2000 workgroup identified where and how the Environmental Protection Agency can increase the industrial base through sector contracting. For example, as part of the planning for the Superfund technical assessment and response team contracts, the Environmental Protection Agency regions have submitted initial plans for awarding more than one contract per region. In almost every region, it is expected that one solicitation will be a full and open competition and one or more will be set-aside for small businesses or small disadvantaged businesses.

Additionally, under this class of contracts, the new requirements for price evaluation adjustment for small disadvantaged business concerns and the small disadvantaged business participation program will apply in the full and open competitions. The Environmental Protection Agency plans to include as part of the technical evaluation, an evaluation of each potential offeror's commitment to the Agency's goal for participation by small, HUBZone small, women-owned and small disadvantaged businesses as team members and/or subcontractors, as well as an offeror's participation in the Agency's Mentor-Protegee program as a mentor firm. In accordance with the requirements of the Small Business Contracting Program and the Agency's Office of Small and Disadvantaged Business Utilization policies, the successful offerors, if not small businesses, will be required to submit acceptable subcontracting plans. Our administrative contracting officers will monitor the contracts to ensure that the subcontracting plan is enforced to provide participation by small, HUBZone small, women-owned and small disadvantaged businesses to the maximum extent possible consistent with efficient performance.

Question. Has the Environmental Protection Agency lowered its contract management costs through its recent practice of using the Army Corps of Engineers to manage about 40 percent of its cleanup work? Is the Environmental Protection Agency giving consideration to using the Corps additional workload to manage, in view of its expertise in this area? If not, why not?

Answer. One of the major elements of the Contracts 2000 strategy is the continued use of the U.S. Army Corps of Engineers to manage large, complex remedial actions. Specific advantages we derive from the relationship include an ability to leverage limited Environmental Protection Agency technical resources, Corps' personnel add an additional federal presence at our sites, and they can perform inherently governmental construction/contract management functions. The Environmental Protection Agency uses commercial contractors to perform the remaining response activities as well as construction oversight and remedial actions under \$15,000,000.

GAO: RCRA CORRECTIVE ACTION PROGRAM

Question. The Environment and Public Works Committee recommended shifting \$27 million from the Superfund program to the RCRA corrective action program. Many sites under the RCRA corrective action program are Superfund-caliber. What do you think about his recommendation?

Answer. We believe funding included in the President's year 2000 budget is adequate to keep the program on track to meet our 2005 GPRA Environmental Indicator goals (By 2005, Human exposure will be controlled at 95 percent of RCRA high priority contaminated hazardous waste facilities, and releases to groundwater will be controlled at 70 percent of these facilities). However, the Agency is currently conducting an internal mid-year review to determine accomplishments to date. Part of that review will focus on whether accomplishments to date and projected commitments will ensure that we achieve our 2005 targets. This approach directly reflects the revision process outlined in GPRA and OMB guidance and other materials. The Agency believes that resources requested for EPA and State oversight in the fiscal year 2000 President's Budget are adequate to keep the program on track to meet the fiscal year 2005 goals.

Question. Could we achieve more public health protections by shifting these funds?

Answer. The Agency believes there are fundamental differences between the RCRA Corrective Action and Superfund programs that do not support resource comparisons. Unlike Superfund where roughly 25 percent of cleanups are funded through the Trust Fund, RCRA cleanups are 100 percent owner/operator funded. EPA and State RCRA Program grant resources fund oversight by EPA and State regulators but no actual cleanup. In addition, while Superfund is primarily a Federal program wherein EPA maintains overall responsibility for cleanups (even where States manage cleanups under cooperative agreements with EPA), the RCRA cleanup program is formally delegated to, and run by 33 of the States in lieu of EPA.

Question. GAO's testimony states "Given that the Superfund program is now almost 20 years old and that most of the sites are in construction and moving toward completion, we would expect to see a trend where spending on cleanups is increasing and administrative costs are decreasing due to the changing workload mix and program efficiencies. Since this is not the case, EPA may have opportunities to achieve more administrative efficiencies in the program and therefore manage a reduction in its Superfund program through such efficiencies rather than by reducing actual cleanup workload." Do you agree?

Answer. EPA has committed to the completion of 85 constructions per year through fiscal year 2005. This commitment is based on maintaining the current pace of work and current funding levels. If no new sites are added to the National Priorities List (NPL), at the end of fiscal year 2005, approximately 200 sites will await completion of construction. Assuming the completion of 85 constructions beyond fiscal year 2005, it will take an additional 2 to 3 years to complete construction of sites currently listed on the NPL.

Based on a GAO survey, 1,789 sites in the Comprehensive Environmental Response, Compensation, and Liability Information System have been identified as potentially eligible for placement on the NPL. EPA and State officials have identified at least 232 of those sites as strong candidates for the NPL. Our current level of funding supports 30 to 40 listings a year. Based on an annual average of 26 additions to the NPL over the past six years, it will require almost 9 years to list all 232 sites. Completion of constructions will take considerably longer.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. GAO has determined that only about 40 of EPA's roughly 320 performance measures are true results-oriented measures. The rest are traditional outputs, such as the number of permits issued or reviews conducted, and in the area of right-to-know, the number of web site hits. Why has EPA been slow to adopt results-oriented performance measures that directly address environmental and public health protections?

Answer. The Agency is committed to improving its performance measures and developing outcome measures and goals where appropriate and when data are available. However, development of results-based data and methods requires close consultation and coordination with our partners in the States and Tribes. In many cases, results-based performance measures can only be developed after necessary analytical methods and monitoring/data management systems have been developed and implemented. In addition, there is often a significant lag time between the collection, reporting, and analysis of environmental data. In summary, we recognize that our current performance measures are largely output-oriented; we are working to increase the number of outcome-oriented measures.

Question. What specific efforts are planned to increase the number of true performance measures, and how high a priority is this?

Answer. EPA is fully committed to the principles of results-based management. Each EPA program is continuously evaluating the type and quality of data and analysis needed to improve its effectiveness and efficiency. Through the National Environmental Performance Partnership System, together with the States and Tribes, the Agency is developing better compliance tracking and program performance data, thereby enhancing our ability to develop outcome measures. For example, the Office of Research and Development, working together with EPA's regional offices and our partners in the States, has begun an initiative to provide ambient monitoring data for the entire U.S. coastline. In addition, the Center for Environmental Information and Statistics and the Agency's new Information Office are in the process of assessing the Agency's long-term strategic information needs.

Question. To what extent is the lack of data the reason EPA has not developed a large number of real performance measures?

Answer. Insufficient data is the most limiting factor. Results-oriented performance measures typically require extensive monitoring data for the results to be statistically valid. Some programs have such data (e.g., for air quality) but most do not. These data-sets need to be collected in a comprehensive manner, usually over some period of years, to support reliable analyses of environmental conditions and trends. In recent years, the Agency has invested in better systems for collecting and analyzing environmental data, and more work is planned to provide the data needed to assess performance as required by GPRA.

GAO: REINVENTION

Question. Reinvention. GAO has cited EPA's so-called reinvention efforts a major management challenge, yet many of these efforts are key to implementation of inno-

vative and more effective means of improving the environment. Reinvention efforts in general are aimed at achieving better environmental results through the use of innovative and flexible approaches, which we all agree makes sense. GAO has listed a large number of concerns, such as achieving “buy in” among the agency’s rank and file, achieving agreement among stakeholders, and an uneven record in evaluating the success of initiatives. What is your response to these concerns?

According to a recent “Inside EPA” article, an EPA-commissioned study of the Common Sense Initiative has found that “the CSI principles have not yet reached into the heart of EPA’s operations, and there remain strong concerns among participants that the agency has given up trying to drive a broader institutional embrace of reinvention concepts. CSI has as yet made little progress in addressing broad regulatory changes.” Does EPA agree with the conclusions of your contractor’s review? What plans does EPA have to address these concerns?

Please describe what new “reinvention” initiatives are underway, such as the Sustainable Industry program, and the budget request associated with these initiatives, and explain how these new initiatives differ from and build on older initiatives such as CSI. Have sufficient resources been requested to follow through on initiatives which have already been started?

Answer. Several evaluations of the Common Sense Initiative (CSI) were completed in its four-year history (1994–1998) and EPA has been responsive to all of the findings and recommendations from these reviews. In February 1997, an independent contractor issued its review of CSI. Subsequently, in July 1997, the General Accounting Office (GAO) released their evaluation of CSI. EPA actions as a result of these evaluations included: better defining CSI’s goals and expected results, clarifying how the Council and Sector Subcommittees will accomplish their work, and developing Council and Subcommittees result-oriented performance measures. With the completion of the CSI experiment in December 1998, a four-year evaluation of the initiative was commissioned and results of that evaluation were announced in mid-April 1998. While we agree with some of the recent contractor’s review, EPA has not given up on the institutional embrace of sector concepts, nor do we believe that CSI has resulted in little progress toward addressing regulatory changes.

CSI’s completion did not represent the conclusion of Agency sponsored sector-based, multi stakeholder work, rather it represented the transition to new actions for sector-based environmental solutions. An Agency-wide Sector Action Plan has been prepared based on the CSI experience. The Plan was approved by the CSI Council and EPA senior management last Fall and is currently being implemented. The goal of the Plan is to incorporate sector strategies into Agency core functions, where appropriate, to solve environmental problems. Further, the Plan will build EPA management capacity to conduct sector work and involve external stakeholders to craft sector-based solutions. The sector plan addresses many of the independent contractor’s findings about the Agency’s long term commitment to implementation of CSI activities.

Nearly 30 recommendations were generated through the CSI experiment. Some are resulting in permanent regulatory changes, while others are focused on implementing longer term, next generation environmental policy tools such as voluntary, performance-based regulatory systems. The combination of EPA efforts in responding to these recommendations with the multifaceted approach in the Sector Plan will result in a deeper acceptance of using the sector approach in solving environmental problems.

The Sustainable Industry (SI) Program was created prior to the launching of the CSI experiment and continues to operate as an “incubator” for Agency-wide sector activities. CSI accelerated the early SI program activities with the metal finishing sector to the successful development of the Strategic Goals Program, a first-of-its-kind, performance based, non-regulatory process. In the transition of CSI sector work in the Sector Plan, EPA has committed through existing resources to complete unfinished Sector projects, as well as support new projects that may be identified during fiscal year 1999 and fiscal year 2000. Three former CSI sectors—metal finishers, printers, and petroleum refiners—have “works-in-progress” that will be supported with these resources. In addition, the Agency has established, through the Federal Advisory Committee Act, a new Sector Committee to help transition former CSI activities into core Agency functions, as well as maintain accountability to external stakeholders on our sector work. It is expected that sufficient resources have been requested to complete these and other initiatives, which have already been started.

BETTER AMERICA BONDS

Question. The President's budget would give EPA a new role of allocating bond allotments for environmental projects through the Better America Bonds initiative.

(1) Why do we need this new program, given the existing funding mechanisms such as the Land and Water Conservation Fund?

(2) What experience does EPA have in reviewing state and local proposals for such activities as land acquisition?

(3) What would be the costs to EPA of administering this program, and which program office would be responsible?

(4) What will be the cost to the taxpayer of issuing all \$9.6 billion in bonds over their entire 15-year life span?

(5) How does EPA plan to provide oversight for the program to ensure that environmental goals are accomplished?

Answer. (1) The Land and Water Conservation Fund (LWCF) is primarily focused on federal land acquisitions whereas the Better America Bonds is a new financing tool for communities to preserve and enhance green space, protect water and clean up brownfields.

Both the LWCF and Better America Bonds provide a financial means for communities to acquire lands or interest in lands for the preservation of open space and the protection of water quality. LWCF is used to acquire open spaces for recreation purposes or habitat protection. Better America Bonds can be used for this and other purposes including protecting water quality and cleaning up brownfields. The two programs provide different funding mechanisms for land acquisition thereby giving communities the flexibility to choose a mechanism that is most appropriate for them.

The Clean Water State Revolving Fund (CW-SRF) and Better America Bonds have similar goal of protecting water quality but they meet this goal in different ways. The vast majority of CW-SRF resources fund traditional wastewater treatment plants. Such projects would not be eligible under the Better America Bonds program. Many communities will have different water quality needs that the Better America Bonds program can help address. Water quality projects that would potentially qualify for a Better America Bonds include wetlands restoration, purchase of land critical to watershed protection, settling ponds and the creation of planted or forested buffer strips along waterways.

The proposed Better America Bonds program would not only be about 50 percent less costly to communities than tax exempt bonds but would also be significantly less costly than most CW-SRF loans.

This proposed program would be another tool that communities would have to address environmental problems.

(2) As the agency responsible for protecting public health by cleaning up our air, water and land, and ensuring that all Americans have access to a clean and healthy environment, EPA is best suited to help communities meet the stated goals of the program—protecting water quality, cleaning up brownfields for reuse, and preserving green space. The Better America Bonds program builds upon EPA's successful existing programs that work with communities to improve local water quality and to clean up brownfields sites so that they can be returned to productive community use.

Furthermore, the Agency currently manages various bond-related programs such as the Clean Water State Revolving Fund and maintains an Environmental Finance office. The Agency would draw upon the significant expertise in these and other programs to run the Better America Bonds program. Finally, parts of this program will be managed by the Treasury Department (including enforcement by the Internal Revenue Service.)

To ensure a broad range of expertise, EPA will chair a panel of departments and agencies including HUD, USDA, Interior, FEMA, and Treasury. EPA will work closely with them on the design of the program, the selection criteria, the application process, and the awarding of bonding authority.

(3) The Agency intends to administer this program in a cost effective manner and anticipates being able to absorb administrative expenses with existing agency resources. The Agency did not seek any new resources in EPA's fiscal year 2000 budget request to run this program.

There are several factors supporting this approach. First, as stated by the Administrator, EPA does not intend to issue any regulations for this program. Instead, EPA will develop basic guidance documents to assist communities in applying for bonding authority. Second, the program will involve several current Agency programs such as the Brownfields office, various water quality programs, and our Environmental Finance Office.

(4) The Treasury Department has designed this tax credit bond so that the subsidy to the communities will in present value terms equal approximately half the value of the bond. In other words, the cumulative tax expenditure for this program should be approximately \$4.8 billion (in present value terms) over the entire life span of the bonds. This tax expenditure will be incurred over a period of time that will be longer than 15 years. (The proposal calls for five years of bonding authority. Furthermore, communities have up to three years to issue the bonds and use the proceeds. Therefore some Better America Bonds could be retired 23 years after the start of the program.)

(5) As with other types of bonds, the Internal Revenue Service will monitor communities' compliance with the requirements of the program. During the fifteen year term of the bond, if 95 percent of the proceeds fail to be used for a qualifying purpose or if the use changes to a disqualified use, no further credits would accrue and issuers would be obligated to reimburse the federal government for any credits accruing prior to that date. If a settlement cannot be reached with the issuer, the federal government would have the right to recover past credits from the bondholders. Problems like this are very rare with respect to tax-exempt bonds and we expect that to be the case with Better America Bonds. In addition, EPA will stand ready to provide technical assistance to communities that request it, as they implement their programs.

ENVIRONMENTAL JUSTICE PROGRAMS

Question. EPA Environmental Justice Programs. Last year at this time you indicated that you would have a final resolution on the Interim Guidance that EPA put forward to resolve environmental justice complaints. In fact, you indicated that a FACA committee had been set up and that you were targeting December 1998 to have a final guidance in place. Can you tell me what the status of this situation is, as it appears that there is no final guidance or rulemaking from the agency?

Answer. In March 1998, Administrator Browner established a Title VI Implementation Advisory Committee ("Title VI Advisory Committee"). That Advisory Committee was comprised of representatives of state, tribal, and local governments, businesses, environmental justice groups, and other interested stakeholders. The Title VI Advisory Committee was asked to focus primarily on possible guidance to EPA assistance recipients such as state permitting agencies and make recommendations to help them design programs that will address concerns under Title VI of the Civil Rights Act of 1964, as amended ("Title VI") early in the permit process. EPA believes that such an approach will enable potentially impacted communities to be involved in the permit process in a meaningful manner while also providing state and local decision-makers and businesses sufficient clarity regarding the process.

EPA committed to the Title VI Advisory Committee that it would not issue revised Title VI guidance until after the Committee completed its deliberations. The Title VI Advisory Committee was originally scheduled to conclude its work in December 1998. However, the Committee requested additional time to develop their final recommendations. EPA agreed and the Committee completed its work in March 1999 and submitted its final report with recommendations to the EPA Administrator in April 1999.

Issuance of the Interim Guidance for Investigating Title VI Administrative Complaints Challenging Permits ("Interim Guidance") in February 1998, opened a continuing dialogue with stakeholders that is helping to shape the Agency's revised guidance. Participants in the dialogue include state and local officials, business leaders, and community leaders. As part of the process for finalizing the Interim Guidance, EPA is reviewing the Title VI Advisory Committee recommendations and public comments. EPA also will hold a series of focus group sessions with representatives of various stakeholder groups to receive more feedback. Later this year, the Agency intends to issue a draft revised guidance for additional public comment.

Question. One of the concerns raised last year was that by going through the guidance process verses rulemaking that there were several procedural steps that may be left out. For example, working with the SBA on small business panels to determine the impacts of such a policy on small business. Can you tell me if you are not going through a rulemaking process, why not? What steps are you planning to take that will ensure that important steps are not left out of this process? Are you working with SBA?

Answer. EPA will not be issuing its revised Title VI guidance using formal or informal rulemaking procedures. The revised guidance is intended only to provide a framework for the processing by the Office of Civil Rights ("OCR") of complaints filed under Title VI by updating the Agency's procedural and policy framework to accommodate the increasing number of Title VI complaints that allege discrimina-

tion in the environmental permitting context. It will not create any new substantive rights, nor establish any binding legal requirements. Accordingly, the revised Title VI guidance is expressly exempted from the notice-and-comment rulemaking requirements of the Administrative Procedure Act ("APA") by section 553(b)(3)(A). Nonetheless, as described in more detail later, EPA intends to publish the draft revised guidance in the Federal Register and solicit written public comment, as well as hold a series of listening sessions after the draft revised guidance is published to obtain more feedback.

With respect to impacts on small entities, including small businesses, because the guidance will establish no binding legal requirements, there is no regulatory impact to any entity of any size. The analytical requirements of the Regulatory Flexibility Act, as amended by the Small Business Regulatory Enforcement Fairness Act, only apply to certain regulations that impose an impact on those small entities directly regulated by a proposed or final regulation. *Mid-Tex Electric v. FERC*, 773 F.2d 327 (D.C. Cir. 1985); *Motor & Equipment Mfg. Ass'n v. Nichols*, 142 F.3d 449 (D.C. Cir. 1998). That is not the case here.

Question. What steps are you taking to ensure sufficient public input?

Answer. Since the issuance of the Interim Guidance in February of 1998, EPA has taken a number of steps, including establishing the Title VI Implementation Advisory Committee, to ensure appropriate input from stakeholders, including state, tribal, and local officials, business representatives, and environmental justice groups. Over the past year, EPA staff have met with representatives from industry, environmental justice communities, and states, tribal, and local governments to discuss their concerns about environmental justice and Title VI issues. The Administrator met with representatives from the U.S. Conference of Mayors in Detroit last summer and met with representatives from the Environmental Council of the States ("ECOS") in the fall to discuss their issues and concerns on this important subject.

EPA has established a cooperative agreement with ECOS, which will be used to develop a state approach to environmental justice issues, including developing effective working relationships with the environmental justice community. The states are currently planning a meeting with national environmental justice representatives, as a result of this cooperative agreement.

As EPA moves toward finalizing the guidance, we will continue meeting with individual stakeholder groups, such as ECOS, local officials, and environmental justice groups, to discuss issues of concern to them relative to the internal Title VI guidance. Additionally, EPA will sponsor a series of diverse, stakeholder focus groups to discuss issues and concerns prior to publication of the draft revised guidance for public comment. In addition to soliciting written comments on the draft version of the revised guidance through publication in the Federal Register, EPA will hold a series of public listening sessions across the country to receive public comments.

Question. Will this document go to OMB for review? What about inter-agency review?

Answer. The Office of Management and Budget (OMB) routinely reviews agency regulations. However, EPA has determined that this not a regulation. On occasion, OMB also asks to review non regulatory guidance that an agency produces. At this time, OMB has not asked to see this guidance. EPA, however, has consulted with the Department of Justice (DOJ) prior to issuing the Interim Guidance, and is currently coordinating with DOJ and the Council on Environmental Quality as the guidance is being revised.

Question. Do you envision this guidance as binding? Do you plan to submit it to Congress under the Congressional Review Act as tendered in a legal opinion by the GAO?

Answer. Like the Title VI Interim Guidance, the revised Title VI guidance will be non-binding and is intended only to provide a framework for the processing by EPA's Office of Civil Rights ("OCR") of complaints filed under Title VI. The revised guidance, like the Interim Guidance, will have no binding legal effect. Since its passage, EPA consistently has interpreted the Congressional Review Act ("CRA") as applying only to agency actions containing binding legal requirements. Policy statements and guidance documents are not binding and have no binding legal effect on the public; generally, they are intended to provide information regarding an EPA regulation or enforcement position that may be useful to both EPA employees and the public. Accordingly, EPA does not believe the revised Title VI guidance is subject to the CRA.

The General Accounting Office ("GAO") concluded that the Interim Guidance was subject to the CRA, in part, because EPA inadvertently used mandatory language in the Interim Guidance; thus, GAO believed that the "new steps in the procedure for handling disparate impact assessment [are] mandatory. They clearly alter the existing regulation and give to recipients significant rights that they did not pre-

viously possess for obtaining dismissal of the complaint.” (Letter of Robert P. Murphy to The Honorable David M. McIntosh, dated January 20, 1999.) The GAO letter noted that, although the first part of the Interim Guidance “largely confirms requirements that largely exist in EPA regulations,” the Interim Guidance altered the existing regulation to give recipients rights that they did not previously possess for obtaining dismissal of the complaint. GAO did note that EPA’s position that the Interim Guidance was not a rule was stronger with respect to the second part of the guidance entitled “Impacts and Disparate Impact Analysis.” GAO concluded that, although the guidance stated the five steps that OCR would follow in conducting its analysis:

“[I]t can be argued that these steps are the kinds of steps that statisticians would be expected to follow in conducting a disparate impact analysis. Also, OCR has broad discretion in deciding how to proceed in conducting each of the steps of the analysis, a factor courts often consider in determining whether a binding rule affecting substantive rights exists under the APA.”¹

As stated previously, EPA did not intend for the Interim Guidance to create new substantive obligations, nor does EPA agree with GAO that it did so. EPA only intended to provide a framework for the processing by OCR of complaints filed under Title VI. EPA intends to draft the revised Title VI guidance in a manner that clearly indicates it is non-binding in nature. Mandatory language will be deleted, and a notation will be prominently displayed indicating that EPA is free to deviate from the guidance on a case-by-case basis, as appropriate. Accordingly, since it will not be a binding substantive rule, EPA does not believe it is subject to the CRA. Nevertheless, the Agency intends to submit courtesy copies of the revised Title VI guidance to both Houses of Congress and GAO when it is issued.

Question. What consideration has been given to letting States set up their own environmental justice programs to resolve Title VI complaints and providing Federal oversight in this regard verse establishing a new large Federal program to decide these individual siting and permitting cases which are decisions which should be handled at the State and local levels?

Answer. Title VI of the Civil Rights Act of 1964, as amended (Title VI) prohibits recipients of federal financial assistance (e.g., states, universities, local governments) from discriminating on the basis of race, color, or national origin in their programs or activities. Title VI allows persons to file administrative complaints with the federal departments and agencies that provide financial assistance alleging discrimination based on race, color, or national origin by recipients of federal funds. OCR is responsible for the Agency’s administration of Title VI, including investigation of such complaints.

EPA has a responsibility to enforce Title VI and ensure that EPA assistance is not being used to subsidize discrimination based on race, color, or national origin. This prohibition against discrimination under Title VI has been a statutory mandate since 1964 and EPA has had Title VI regulations since 1973. It is important to note that the Department of Justice has recently reiterated its position that Federal agencies may not delegate to states the authority to determine compliance with Title VI. While recognizing that limitation, EPA will explore suggestions to encourage states and local governments to perform various preventive measures, including the discussion on this topic in the Title VI Advisory Committee’s report.

Question. Has the EPA analyzed State programs to see what works and what doesn’t work? Has the agency thought about a template or model which could be used for States to set up their own programs?

Answer. The focus of the Title VI Advisory Committee was primarily on possible guidance to EPA assistance recipients, such as state permitting agencies, and make recommendations to help them design programs that will address Title VI concerns early in the permit process (i.e., external guidance). The directors of the environmental agencies for Michigan, New Jersey, Texas, Maryland, and Oregon were members of the Title VI Advisory Committee. Formal presentations on the approaches taken in Texas and New Jersey were made to the Committee and the efforts of other states were discussed. The report of the Title VI Advisory Committee’s recommendations were delivered to the Administrator in April. The Report contains eight consensus principles of the Committee, as well as a template intended to serve as a model for state and local governments that elect to establish environmental justice programs. It also contains the members’ differing views regarding the implica-

¹ Id. At 6.

tions of the range of policy options available to EPA as it develops its Title VI program.

Moreover, EPA has been supporting the development of programs to address environmental justice and Title VI issues, as well as facilitating communication among states and local governments on effective approaches. For example, we are working with the Environmental Council of the States ("ECOS") through a cooperative agreement which will be used to develop an effective state approach to environmental justice issues. The starting point for ECOS's work under the cooperative agreement is its 1998 Proposed Elements of State Environmental Justice Programs. ECOS is currently planning a meeting with national environmental justice representatives to discuss the proposed elements. Part of this work should facilitate the development of a working relationship between state agencies and the environmental justice community.

Additionally, EPA's Office of Environmental Justice has established the State and Tribal Environmental Justice (STEJ) Grants program to provide assistance to states and tribes as they work to achieve environmental justice and/or ensure their programs comply with Title VI. For fiscal year 1998, EPA awarded five STEJ grants for a total of \$500,000 to Texas, Tennessee, New Jersey, Vermont, and the Kalispel Tribe of Indians. EPA is currently reviewing applications for fiscal year 1999, for which another \$500,000 in STEJ grant funds are available.

Question. How many Title VI claims are at the agency now? How are these have been resolved in the last year? Last year we included report language asking that these claims be resolved as expeditiously as possible and I would like to know how this is being done?

Answer. As of April 30, 1999, a total of 75 Title VI administrative complaints raising environmental justice concerns have been filed with OCR. Between April 1998 and the end of April 1999, OCR accepted five complaints for investigation, bringing the total number of complaints accepted for investigation to 22. Three of those 22 complaints have been dismissed—one of which was the Select Steel complaint for which EPA issued a decision in October 1998. Informal resolution is currently ongoing for two other complaints. Moreover, EPA is currently actively investigating three complaints. During the past year, OCR rejected seven complaints because they did not meet Title VI jurisdictional requirements (e.g., untimely; alleged discriminatory actor is not EPA recipient). The total number of rejected complaints as of April 30th was 32 and EPA had 21 complaints for which a determination to accept or reject has not yet been made.

SAFE REPAINTING, SAMPLING TECH COURSE, ENG. OCTANE ADDITIVES

Question. The Committee added \$2 million in the fiscal year 1999 for lead outreach and technical studies on "safe repainting". What is the status of those efforts? Are any funds requested in fiscal year 2000? What progress has been made developing the sampling technician course to reduce the cost and expand the availability of visual inspection and dust sampling? When will the course be completed?

Answer. The Agency is planning to conduct various lead outreach and technical activities with these funds. The sampling technician course has been initiated through an existing contract mechanism and work is anticipated to begin this month. Both courses are scheduled for completion by December 1999. Other activities include: (1) development of a renovation and remodeling course curriculum, (2) conduct of analyses to support policy decisions in the development of a national renovation and remodeling infrastructure, (3) enhancements to the existing laboratory accreditation program to allow for accreditation of labs using newer cost effective technologies as these methods are developed and become available for use by sampling technicians and during renovation and remodeling activities, (4) assessment of technologies to reduce the cost and improve the efficiency of identifying lead-based paint during repainting and renovation and remodeling activities, and (5) outreach efforts to inform the public about "safe repainting". In addition, the agency is considering using some of the funds available as grants to answer specific "safe repainting" or renovation and remodeling technical questions. The Agency is not seeking additional funding in fiscal year 2000.

Question. What is the status of EPA's efforts to evaluate existing data to examine the effectiveness of additives to reduce engine octane demand? What is EPA's assessment of the importance of additives that control combustion chamber deposits in reducing octane demand and improving fuel economy?

Answer. In the final rule on the certification standards for deposit control gasoline additives (July 5, 1996, 61 FR 35309), EPA extensively evaluated the potential impacts of combustion chamber deposits (CCD) and vehicle octane requirement increase (ORI) on gasoline vehicle emissions and fuel economy. At that time, EPA con-

cluded that there was insufficient evidence that ORI should be reduced to prevent an adverse impact on fuel economy. EPA also concluded that there was inadequate evidence that a reduction in ORI would result in a cost-effective reduction in total energy use or emissions from gasoline refineries and motor vehicles.

The final rule also concluded that there was inadequate information on the impacts of CCD on emissions, fuel economy, and driveability to draw conclusions regarding the costs and benefits of requiring additives for CCD control. It was also noted that no appropriate performance test procedures and standards exist for evaluating the impact of additives on CCD.

Since the publication of the final rule, EPA has continued to evaluate information on these issues as it has become available. Despite considerable effort by industry to evaluate additive impacts on CCD and the impact of CCD on emissions, EPA finds the situation fundamentally unchanged. The Coordinating Research Council (CRC), a cooperative investigative group funded by the automotive and petroleum industries, is currently undertaking an extensive test program to evaluate additive impacts on CCD. EPA plans to review the results from this program when they become available approximately one year from now. EPA hopes that the results of this program will facilitate the Agency's further evaluation of whether CCD control is necessary and feasible.

GPRA: PERFORMANCE BASED MANAGEMENT

Question. What specific steps have you taken as head of the agency to achieve performance based management within your agency, as required by the Government Performance and Results Act?

Answer. The Agency has moved aggressively to meet and exceed the requirements of GPRA. In 1995, EPA embarked on a far-reaching effort to fundamentally change past approaches to planning, budgeting, performance measurement, and accountability. This entailed core changes to budget and financial management structures and the implementation of processes to link budgeting and management accountability. The Agency created a new Planning, Budgeting, Analysis and Accountability (PBAA) process that is intended to dramatically improve EPA's ability to achieve results.

The new PBAA process has four specific purposes: (1) to develop goals and objectives for accomplishing the Agency's mission; (2) to improve the link between long-term planning and annual resource allocation; (3) to enhance our ability to use human health and environmental risk information in setting priorities; and (4) to better assess our accomplishments and provide feedback for making future decisions. While this effort will take several years to fully implement, the Agency is making real progress in the short term while we build for the future. The new PBAA process comprises several steps, including:

A Strategic Plan, which describes EPA's strategic mission, long-term goals, and specific shorter-term (i.e., 5 years or more) objectives that the Agency will meet in achieving the goals.

Annual Performance Plans and Budget Requests, which are derived from the Strategic Plan and ongoing strategic planning efforts, serves as the basis for budget decisions. They describe annual performance goals, measures of outputs and outcomes, and activities aimed at achieving the annual performance goals and making progress toward longer-term goals and objectives.

Annual Performance Reports, required by GPRA six months after the end of each fiscal year, which will assess the progress EPA has made toward achieving its goals and report on the Agency's success in accomplishing its annual performance goals.

GPRA: ACCOUNTABILITY OF MANAGERS

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. Accountability is a crucial element of the Agency's overall planning and budgeting framework. The Agency has established senior management teams for each of its strategic goals. These teams assess progress being made to achieve the goals, and develop recommendations for changes in approach or emphasis needed to ensure that our strategic goals and objectives are met. In addition, the Agency's National Program Managers, working with the senior leadership in the Regions, develop annual goals and performance measures that support achievement of the Agency's long-term strategic goals and objectives. EPA's senior managers are also working with the States under the National Environmental Performance Partnership System (NEPPS) to negotiate performance partnership agreements necessary to meet clearly defined performance measures.

GPRA: USE OF PERFORMANCE INFORMATION

Question. How is your agency using performance information to manage the agency?

Answer. The Agency created a new Planning, Budgeting, Analysis and Accountability (PBAA) process that is intended to dramatically improve EPA's ability to achieve results.

The new PBAA process has four specific purposes: (1) to develop goals and objectives for accomplishing the Agency's mission; (2) to improve the link between long-term planning and annual resource allocation; (3) to enhance our ability to use human health and environmental risk information in setting priorities; and (4) to better assess our accomplishments and provide feedback for making future decisions. While this effort will take several years to fully implement, the Agency is making real progress in the short term while we build for the future. The new PBAA process comprises several steps, including:

A Strategic Plan, which describes EPA's strategic mission, long-term goals, and specific shorter-term (i.e., 5 years or more) objectives that the Agency will meet in achieving the goals.

Annual Performance Plans and Budget Requests, which are derived from the Strategic Plan and ongoing strategic planning efforts, serves as the basis for budget decisions. They describe annual performance goals, measures of outputs and outcomes, and activities aimed at achieving the annual performance goals and making progress toward longer-term goals and objectives.

Annual Performance Reports, required by GPRA six months after the end of each fiscal year, which will assess the progress EPA has made toward achieving its goals and report on the Agency's success in accomplishing its annual performance goals.

EPA is now in its first cycle of evaluating performance information in the context of the GPRA structure. Though our processes may change as we gain experience this year, we have already made significant progress in incorporating performance information into the Agency's decision-making. For example, in May the Deputy Administrator met with the Agency's senior managers to discuss the performance data so far received and to evaluate how this might impact our priorities in fiscal year 2001. The Agency is committed to continuing this integration of performance evaluation and Agency priority-setting.

GPRA: USE OF PERFORMANCE INFORMATION IN DEVELOPING FISCAL YEAR 2000 BUDGET REQUEST

Question. How did program performance factor into your decisions about the funding you are requesting in fiscal year 2000. Please provide examples.

Answer. As part of the Agency's overall planning, budgeting, analysis and accountability framework, the Agency conducts periodic reviews of changes needed to ensure that the Agency will achieve its long-term strategic goals and objectives. The results of these reviews are incorporated into the annual plan and budget request. The integration of our budget with performance planning has enabled the Agency to identify more than 70 specific performance goals associated with the funding requested in fiscal year 2000. Examples include:

- 5 percent reduction of air toxics emissions as part of the Agency's Air Toxics program;
- an increase to 91 percent of the population served by community drinking water systems meeting all 194 health based standards as part of the Agency's Drinking Water program;
- the implementation of environmental improvement projects in 350 watersheds as part of the Agency's Clean Water Action Plan;
- a 200 million pound reduction in the quantity of Toxic Release Inventory (TRI) pollutants released, treated, or combusted for energy recovery as part of the Agency's Pollution Prevention program; and
- a reduction of more than 50 million metric tons carbon equivalent of greenhouse gas emissions as part of the Agency's Climate Change Technology Initiative.

GPRA: PROGRAM CHANGES TO IMPROVE PERFORMANCE

Question. What specific program changes have you made to improve performance and achieve the goals established in your strategic and annual plans?

Answer. The Agency has fully integrated its budget with strategic and annual planning, and has revised its budget structure to allocate 100 percent of its resources within its goal—objective architecture. Accordingly, the priorities and initiatives contained in the President's Budget for fiscal year 2000, such as the Clean Water Action Plan, Climate Change Technology Initiative, Health Threats to Chil-

dren, Clean Air Partnership Fund, and Chemical Right To Know program, reflect program changes proposed to achieve the goals in the Agency's strategic and annual plans. Since we are still in the first cycle of performance information in the GPRA context, it is premature to suggest programmatic changes that may be suggested by the first year's data.

GPRA: LINK BETWEEN RESOURCES AND PERFORMANCE GOALS

Question. How does your budget structure link resource amounts to performance goals?

Answer. The Agency has adopted a common framework for its planning, budgeting and financial management structures. This has enabled EPA to fully integrate its budget structure with its annual plan. EPA has based its strategic plan on ten long-term goals. Each goal consists of a number of strategic objectives which define the environmental outcomes we are attempting to achieve over several years. EPA's budget and annual plan use the same structure. The budget and annual plan identify resources and performance information associated with each strategic objective.

GPRA: CHANGES TO IMPROVE LINK BETWEEN RESOURCES PERFORMANCE GOALS

Question. What, if any, changes to the account and activity structure in your budget justification are needed to improve this linkage?

Answer. The Agency realigned its activity structure in fiscal year 1999 to match the structure of its strategic plan. There are no plans at present to request a change in our account structure, but we will continue to evaluate the need for changes, and will work with appropriate Congressional Committees if the evaluation reveals that changes to the account structure would enhance our ability to meet the Government Performance and Results Act, or the Federal Financial Management Improvement Act and associated Managerial Cost Accounting Standards.

GPRA: DATA FOR PERFORMANCE REPORT

Question. Does your fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000? If so, what steps are you planning to improve the reliability of these measures?

Answer. The Agency has completed a preliminary review of our ability to provide valid and verified data in support of all the performance measures used in our fiscal year 1999 annual plan. The results of this review are included in the Agency's fiscal year 1999 Annual Plan. This review revealed that there are areas where data are incomplete, of poor quality, or are inadequate in scope to fully capture the goals contained in the annual plan.

The Agency's budget request for fiscal year 2000 contains resources to address the most critical problems. For example, the Agency is engaged in an extensive effort to improve our ability to evaluate the effectiveness and enhance accountability of our environmental enforcement efforts. Also, we have requested resources to modernize the information systems needed to efficiently collect and manage performance data. One of the Agency's key reinvention efforts is a five-year project to implement new data standards and electronic reporting in 13 major environmental information systems. We are also continuing to work with our State partners to identify the specific performance data improvements needed to measure the environmental results of our delegated environmental programs.

To ensure that we proceed as effectively as possible, the Agency is establishing a new Office of Information. Among other things, this Office will be responsible for identifying a long-term strategic assessment of the Agency's data needs, coordinating investments, and ensuring a consistent application of data quality management practices across the Agency.

GPRA: IMPACT ON FUTURE FUNDING REQUESTS

Question. How will your future funding requests take into consideration actual performance compared to expected or target performance?

Answer. The Government Performance and Results Act requires that Agencies include in their Annual Performance Reports a "summary of the findings of program evaluations completed during the fiscal year covered by the report." In general, these evaluations will provide a link between planning and actual performance by helping to measure progress against both our strategic and annual goals. In addition, EPA has formed multi-Office teams for each of its Strategic Goals. These "Goal Teams" are charged with assessing progress toward achieving long term strategic

objectives and annual performance goals, and with identifying areas where changes in resources may be necessary to achieve those goals and objectives.

EPA is now in its first cycle of evaluating performance information in the context of the GPRA structure. Though our processes may change as we gain experience this year, we have already made significant progress in incorporating performance information into the Agency's decision-making. For example, in May the Deputy Administrator met with the Agency's senior managers to discuss the performance data so far received and to evaluate how this might impact our priorities in fiscal year 2001. The Agency is committed to continuing this integration of performance evaluation and Agency priority-setting.

GPRA: COST ACCOUNTING

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The Agency has fully integrated its budget and financial management processes with its strategic and annual plans. As a result, 100 percent of our budgeted resources are associated with our strategic goals and objectives. However, it is true that the Agency's goals tend to be mutually supportive. Accordingly, the resources under each goal do not and cannot reflect all resources that could be reasonably associated with achieving the goal.

QUESTIONS SUBMITTED BY SENATOR BURNS

FISCAL YEAR 2000 BUDGET REDUCTION

Question. I was surprised to see that EPA is requesting a 5 percent (–\$383 million) reduction for existing programs in its fiscal year 2000 budget. I want to compliment EPA for requesting a smaller budget for fiscal year 2000. However, I do have some concerns with what your budget funds and how it is allocated. What are your priorities in fiscal year 2000 for funding in EPA?

Answer. The Agency always strives to manage its resources prudently, while maintaining its focus on priorities to protect public health and the environment. While we recognize the constraints placed upon our budget annually by overall tight discretionary caps, we also are mindful of our environmental commitments. With a decreased budget this year, we must continue to shift resources to fund the Agency's highest priorities and to comply with new mandates established by Congress, including: the Safe Drinking Water Act Amendments of 1996 (SDWA), and the Food Quality Protection Act of 1996 (FQPA).

Question. Why is EPA moving into regulating health care, especially for children?

Answer. EPA's mission includes protecting public health in the context of environmental protection. We do not, nor do we intend to, regulate health care, per se, which is the mission of other agencies.

Question. Don't other federal departments and agencies such as HHS and BIA, adequately manage and regulate health care issues?

Answer. EPA does not regulate health care management. EPA has always regulated and performed research on substances that affect the health of the public. Through the interagency Task Force on Environmental Health Risks & Safety Risks to Children, EPA is making sure that it does not duplicate the work of other Federal entities.

Question. What are they doing in this area of children's health?

Answer. Administrator Browner and Secretary Shalala co-chair the President's Task Force on Environmental Health Risks and Safety Risks to Children. This Task Force has developed a Federal strategy to address asthma in children and has other work groups examining issues related to childhood cancer, developmental disorders, and unintentional injuries. Each Federal entity brings to the Task Force its unique contribution derived from its mission and expertise in various children's health and safety areas. The Task Force exists both to take advantage of the synergistic effects of cooperation for a common goal and to avoid duplication of efforts across agencies and departments concerned with children's health. Individual departments and agencies can speak best to the specific activities that they are pursuing in children's health.

Question. Why does the Administration have to come up with a new environmental initiative every year such as the new Clean Air Partnership Fund for fiscal year 2000?

Answer. EPA's mission is to protect human health and to safeguard the natural environment. New initiatives are created as environmental needs become more crit-

ical. One of the Administration's most important public health commitments is to improve the air that Americans breathe. Over one third of Americans still live in areas where the air does not meet the new air quality standards.

The Clean Air Partnership Fund will provide new grant resources and opportunities for cities, states and tribes to partner with the private sector, the federal government and each other to provide healthy, clean air in the communities in which we live.

The Clean Air Partnership Fund will demonstrate locally managed programs that achieve early integrated reductions in soot, smog, air toxics and greenhouse gases. The Fund will direct new resources to state and local governments to find the most innovative, cost-effective and protective ways to reduce soot, smog, air toxics and greenhouse gases that contribute to climate change.

BETTER AMERICA BONDS

Question. Concerning the "Better American Bonds" initiative, I am confused on what and how these bonds will work. I understand it is part of the Administration's Livability Initiative to help states and local governments better protect their land and water. In Montana, we need some protection, especially from the federal government since many communities are surrounded by public lands. Plus we need economic development assistance in many small rural communities in Montana. Will these bonds allow local communities to buy conservation easements on agricultural lands to prevent them from being developed? Will these bonds allow local communities to purchase undeveloped lands for future economic development or are these bonds envisioned to lock up local lands from any economic development?

Answer. Better America Bonds can be used for three purposes—to preserve open space, protect water quality, and clean up brownfields. Through a competitive process, state, local and tribal governments can apply to EPA (working in consultation with other federal agencies) for the authority to issue Better America Bonds for these purposes. To preserve open space, a community can either purchase the title to a land parcel or use conservation easements. A different community might decide that a city owned brownfield site should be cleaned up to help revitalize the economy and create jobs, or that a wetland should be restored. The choice is theirs. The program is entirely voluntary—if a community doesn't want to participate, it doesn't have to.

EPA will design the Better America Bonds program to accommodate all types of communities—large, small, urban, suburban, and rural. As EPA works with other agencies to develop this initiative, we will include small communities in our outreach both to provide information about the program and to seek advice as to how to structure the program to meet their needs.

To provide communities with the flexibility to respond to changing circumstances, this program allows communities to change the use of the land (sell a park financed with Better America Bonds to a developer who builds retail space on the land, for example) after the fifteen year term is up and the principal is repaid. We do not expect that many communities will change the use after fifteen years, but in certain cases it might make sense, either for environmental or economic reasons, for the community to do so. To provide a check and balance system, however, before a community can change the use it must allow any 501(c)(3) organizations that are tax exempt for environmental protection purposes the right of first refusal to purchase the land for the purpose of maintaining its qualifying use. The government would have to sell the land to a willing non-profit for the same price at which it was purchased originally. If no qualified buyer is found, the land could then be sold at its fair value for other uses.

This is not a big government program. The federal government will not purchase one square inch of land. Nor will it micromanage local zoning and land use decisions. Our states and communities will build this legacy themselves. All decisions will be made at the state, tribal or local level. We're just providing them new tools they need to grow in ways that are best for them.

Question. How will you implement these bonds, especially since EPA isn't in the business of issuing bonds?

Answer. As the agency responsible for protecting public health by cleaning up our air, water and land, and ensuring that all Americans have access to a clean and healthy environment, EPA is best suited to help communities meet the stated goals of the program—protecting water quality, cleaning up brownfields for reuse, and preserving green space. The Better America Bonds program builds upon EPA's successful existing programs that work with communities to improve local water quality and to clean up brownfields sites so that they can be returned to productive community use.

Furthermore, the Agency currently manages various bond-related programs such as the Clean Water State Revolving Fund and maintains an Environmental Finance office. The Agency would draw upon the significant expertise in these and other programs to run the Better America Bonds program. Finally, parts of this program will be managed by the Treasury Department (including enforcement by the Internal Revenue Service.)

To ensure a broad range of expertise, EPA will chair a panel of departments and agencies including HUD, USDA, Interior, FEMA, and Treasury. EPA will work closely with them on the design of the program, the selection criteria, the application process, and the awarding of bonding authority.

The Agency intends to administer this program in a cost effective manner and anticipates being able to absorb administrative expenses with existing agency resources. The Agency did not seek any new resources in EPA's fiscal year 2000 budget request to run this program.

There are several factors supporting this approach. First, as stated by the Administrator, EPA does not intend to issue any regulations for this program. Instead, EPA will develop basic guidance documents to assist communities in applying for bonding authority. Second, the program will involve several current Agency programs such as the Brownfields office, various water quality programs, and our Environmental Finance Office.

Question. Finally, don't you need authority for this bonding authority and if so, when will we get a chance to see your requested authority?

Answer. To create the tax credit mechanism for the Better America Bonds program, the tax code needs to be amended by Congress. A bill, HR 2446, has been introduced in the House, and we anticipate a bill to create the program will be introduced in the U.S. Senate in the near future. They will be referred to the Finance and Ways and Means Committees, respectively. Assuming that those bills pass, President Clinton would then need to sign it into law.

CLEAN AIR PARTNERSHIP FUND PROGRAMS

Question. Concerning the "Clean Air Partnership Fund," I am not sure how this compares with the state grants programs. It appears to be another \$200 million on top of the \$215 million provided to states and tribes for air quality programs. How are the programs under this new Partnership Fund different from what is done under state and tribal grants by the air program? What demonstrated need exists now for developing "partnerships" on air quality problems or programs? If so, give me some examples? What air problems to you expect will be addressed by these partnerships among local, state, tribal, and federal governments and the private sector?

Answer. State and tribal grants are awarded under Section 105(a)(1) of the Clean Air Act which authorizes grants for the implementation of programs for the prevention and control of air pollution and the implementation of national air quality standards. In contrast, if funds are appropriated for the Clean Air Partnership Fund, those funds will be awarded under Section 103(b) of the Clean Air Act which authorizes grants for research, investigations, experiments, demonstrations, surveys and studies. Awards will be made to support individual innovative demonstration projects such as those that address reductions in air pollutants and greenhouse gases, not to implement ongoing State and tribal air pollution prevention and control programs. Traditionally, air programs (and grants to support them) have pursued solutions to one air pollution problem at a time. With the multiple air quality challenges facing states and private entities, this problem-by-problem approach is no longer optimal. The Clean Air Partnership Fund is designed to support demonstration projects and technologies that can simultaneously address multiple air pollution problems.

EPA's believes that only through partnerships of government, private sector and non-governmental entities will sustained progress towards eliminating significant air pollution problems occur. Partnerships of all kinds are necessary and the Clean Air Partnership Fund will provide a catalyst for their formation. For example, addressing regional air quality problems such as ozone nonattainment requires states and municipalities to partner with each other to formulate regional air quality improvement strategies. In another example, transportation planners and air quality planners must work together to establish transportation management systems that further air quality improvement rather than exacerbate pollution. Similarly, there is a need to encourage state energy officials to form partnerships with local housing authorities to expand low income weatherization assistance in ways that improve energy conservation and reduce air pollution. In yet another example, to realize the potential benefits of reducing multiple pollutants through use of new technologies,

private sector technology providers need to partner with municipal and state governments to demonstrate the capabilities of their clean air technologies and expand their market share.

EPA anticipates that the Fund will address a spectrum of air quality problems including: criteria air pollution such as particulate matter and ozone nonattainment; air toxics; and climate change.

FISCAL YEAR 2000 BUDGET: SUPPORT FOR STATES; JUSTIFICATION FOR 5 PERCENT INCREASE IN OPERATING PROGRAMS

Question. I noticed that even though your total budget request for fiscal year 2000 is decreasing by 5 percent, your Operating Program is increasing by 5 percent (+\$191 million). That part of your budget, as I recall supports more of the federal regulatory establishment instead of supporting the states and tribes who are managing environmental protection on the front lines. What percentage of your budget supports the states and what does this consist of?

Answer. Over 40 percent of the Agency's budget is dedicated to support of the states and tribes. Included in this funding are resources from state grants, the Clean Water and Drinking Water SRFs, LUST cooperative agreements, and Superfund assistance to states.

Within the Operating Programs, the President's Budget provides \$885 million for categorical program grants for state and tribal governments. This funding represents 24 percent of the Agency's total \$3.682 billion for Operating Programs

Question. Why do you need a 5 percent increase in your Operating Program, especially if the funding for the Superfund Program is not changing and funding for your Water Infrastructure Fund is decreasing 30 percent

Answer. The \$3.7 billion request for Operating Programs includes: most of the Agency's research, regulatory and enforcement programs, and funds our partnership programs with states, tribes and local governments. Our Operating Programs represent the backbone of the nation's efforts to protect public health and the environment through sound science, standard setting and enforcement. Through these programs, the Agency works to ensure that our water is pure, our air is clean and our food is safe. This 5 percent increase is critical to help the Agency meet the expectations of the American public for a safe, healthy environment.

SUPERFUND: PROPOSED CLEANUP ACTIONS

Question. I have received quite a few complaints from people in Montana that the EPA does not seem to care about local citizen inputs or ideas—that the public meeting process is a joke and that anytime someone disagrees with the EPA it doesn't matter. As you know, there are many sensitive environmental issues in Montana. Most of the public's complaints seem to concentrate on EPA's review of proposed cleanup actions. However, I want to be assured that when the people of Montana provide comments to EPA, their input will be heard and used. What do you propose to do to counter this negative perception by my constituents?

Answer. The Environmental Protection Agency (EPA) is committed to involving citizens in the site cleanup process. Our community relations effort is based on two-way communication designed not only to keep citizens informed about site progress, but also to give them opportunity to provide input into site decisions. Many opportunities are available to communities to provide input into the cleanup process through technical assistance. Technical assistance is available from a variety of sources depending on the community. For example, Technical Assistance grants are available to communities to hire technical advisors who can explain technical information and documents related to site cleanup and help articulate the community's concerns. We encourage communities to develop community advisory groups (CAGs) which provides an open dialogue between communities and EPA. Community members are encouraged to attend our availability sessions. These sessions allow community members access to the site cleanup team to ask questions and voice their concerns regarding cleanup issues prior to large public meetings.

REGIONAL HAZE: IMPLEMENTATION OF FINAL REGULATIONS

Question. I am concerned with the release of the final regional haze regulations. From my initial review, they seem very complex and difficult to implement. However, the Western governors, through the Western Regional Air Partnership, appear somewhat satisfied. However, I need to understand how this rule will be implemented. It seems to set the stage for a long-term regional planning process which is heavily dependent on the cooperation of all parties. Also this process appears to impinge on state sovereignty. What are the time lines and major milestones of this rule? How will states who have the responsibility of setting and managing haze in

the air over the Class I areas the authority to resolve issues of transboundary emissions from neighboring states and from public lands on which the states have no authority? Given this rule appears to establish a regional planning process, who is the ultimate party to make decisions on these regional plans?

Answer. The regional haze program requires States to establish reasonable progress goals and long term strategies for improving visibility in Class I national parks and wilderness areas, and to adopt control measures to meet these goals. States are to consult with each other in setting Class I area goals and in developing appropriate strategies to meet these goals.

The timelines and major milestones for this rule are as follows:

Initial regional haze implementation plan due dates.—The implementation schedule for the regional haze program is consistent with the provisions in TEA-21 and its intent for integrating control strategies for PM_{2.5} and regional haze. For geographic areas designated as attainment or unclassifiable for PM_{2.5}, the due date for regional haze SIPs is one year after EPA publishes the PM_{2.5} designation. For geographic areas designated as nonattainment for PM_{2.5}, the due date is three years after the PM_{2.5} designation.

Because of the regional nature of visibility problems, the rule also encourages regional planning involving multiple states. Accordingly, if a State participates in a regional planning effort and submits a SIP committing to continue its participation, the state may delay submittal of a regional haze SIP for its attainment areas and submit a regional haze SIP for the entire State on the date a SIP is due for non-attainment areas. This will allow States to develop coordinated regional strategies for both attainment and nonattainment areas and submit one SIP which incorporates those strategies.

For the nine western States which participated in the Grand Canyon Visibility Transport Commission, the final rule provides for an implementation schedule for the 16 Class I areas addressed by the Commission's report consistent with TEA-21 and the recommendations of Western Governors Association. States choosing to follow this optional approach must submit initial regional haze implementation plans in 2003.

Initial Implementation Period.—The time period for the initial regional haze implementation plans will extend from the submittal date of the plan until 2018. Progress Reports and Comprehensive Updates. The rule requires progress reports every 5 years (beginning 5 years after the first SIP submission) and, beginning in the year 2018, comprehensive implementation plan updates every 10 years.

EPA encourages regional planning efforts for States and other stakeholders, including federal land managers, to address the cumulative effect of emissions from multiple States on Class I areas. EPA plans to participate actively in these regional groups to assure its views are known by all participants as the process moves forward. We believe these regional planning efforts will enable participating States and other Stakeholders to reach consensus on coordinated strategies by highlighting the shared benefits of various emission reduction programs, and providing for cost-effective regional control strategies. At the same time, we recognize that under the Act, each State has the ultimate decision making authority regarding adoption of implementation plan provisions. State actions may not be dictated by regional planning organizations. Ultimately, EPA has the authority to approve or disapprove a State's implementation plan based on the State's assessment and selection of reasonable progress goals, the strategies it adopts to meet those goals and other factors.

Question. I hope that the Agency has improved upon its original proposal by providing the states with the flexibility they need to fashion their own visibility programs that Congress intended when it enacted the visibility protection program in 1977 and revised in 1990. What flexibilities are provided to the states in the final rule to fashion local solutions for state visibility problems?

Answer. The final rule provides the States with substantial flexibility in implementing the regional haze program to make "reasonable progress" toward the CAA's national goal of natural visibility conditions in Class I areas. First, States have the flexibility to take additional time to develop a single statewide SIP rather than multiple SIPs on different timelines for attainment and nonattainment areas, provided the State participates in regional planning effort(s). Second, the final rule does not include a presumptive rate of visibility improvement as was included in the proposed rule. States have the flexibility to set progress goals based upon a number of factors in the statute and regulation. Third, States have considerable flexibility in developing long-term strategies addressing an appropriate mix of stationary, mobile, and area sources of visibility-impairing emissions to achieve Class I area progress goals. Fourth, in lieu of requiring compliance on a source-specific basis with the requirement for application of best available retrofit technology (BART), States may develop a cost-effective emissions trading program or other alternative

measure that achieves greater reasonable progress than BART, and involves participation by both BART-eligible and non-BART sources.

REGIONAL HAZE: TEA-21 LEGISLATION —INTEGRATION WITH NAAQS PM2.5

Question. Last year, the necessary regulatory tools for the states to implement visibility rules were not provided. The TEA-21 legislation was amended to provide the states with the necessary time to implement these rules. What are EPA's plans to support the multi-year schedule and multi-million dollar price tag for the states to implement this final regional haze rule? How much funding was provided in fiscal year 1999 and fiscal year 2000 for the states and regional organizations to comply with this new rule. Should additional funding be provided in fiscal year 2000 for implementation of the regional haze rule to ensure it does not develop into an unfunded mandate?

Answer. In fiscal year 1999, the Agency provided approximately \$1.9 million in grant funds to support regional haze work. These funds supported the operation of the visibility monitoring network (IMPROVE) and provided support to states and multi-state organizations addressing regional haze issues associated with the Grand Canyon and the Southern Appalachian Mountains. Additionally and in response to Congress' recommendation, EPA provided approximately \$4.0 million in Agency funding to support a new planning initiative for regional haze and visibility impairment. Recognizing that regional haze is a complex national problem, the Agency is working with all the States to identify the composition of potential regional planning groups. Once these regional planning groups are identified, the Agency will provide each planning organization with initial funding to develop their multi-year work plans and future funding needs. The Agency will incorporate the funding needs of these regional planning organizations in its fiscal year 2001 budget request.

For fiscal year 2000, EPA is directing approximately \$3.6 million in state grant funds for regional haze work. Funding is continued for the visibility monitoring network and support for the Grand Canyon visibility follow on work. Additionally funding is being provided to the States to initiate regional haze planning activities, assess visibility monitoring needs and identify emission inventory and source characterization efforts.

Question. TEA-21 Act requires that the implementation of the regional haze rule and the NAAQS PM2.5 rule be integrated. Obviously, we do not want the implementation of the regional haze program to lead the health-based standards. How will EPA integrate these two regulatory programs to ensure that the implementation of the regional haze rule follows the implementation of the NAAQS PM2.5 rule and that these funds are being expended in the most cost effective manner?

Answer. EPA has provided an implementation schedule for the regional haze program that is consistent with the provisions in TEA-21 and integration of control strategies for PM2.5 and regional haze. For geographic areas designated as attainment or unclassifiable for PM2.5, the due date for regional haze SIPs is one year after EPA publishes the PM2.5 designation. For geographic areas designated as non-attainment for PM2.5, the due date is three years after the PM2.5 designation.

Because of the regional nature of visibility problems, the rule also encourages regional planning involving multiple states. Accordingly, if a State participates in a regional planning effort and submits a SIP committing to continue its participation, the state may delay submittal of a regional haze SIP for its attainment areas and submit a regional haze SIP for the entire State on the date a SIP is due for non-attainment areas. This will allow States to develop coordinated regional strategies for both attainment and nonattainment areas and submit one SIP which incorporates those strategies.

For the nine western States which participated in the Grand Canyon Visibility Transport Commission, the final rule provides for an implementation schedule for the 16 Class I areas addressed by the Commission's report consistent with TEA-21 and the recommendations of Western Governors Association. States choosing to follow this optional approach must submit initial regional haze implementation plans in 2003.

We believe that by providing opportunities for regional planning and for the integrated implementation of the PM2.5 and regional haze control strategies, the regional haze rule allows States to address both air quality programs in a cost-effective manner.

RISK MANAGEMENT PLAN RULE ON PROPANE

Question. I am very concerned with your Risk Management Plans rules issued under Section 112(r) of the Clean Air Act especially as they relate to non-toxic flam-

mable fuels such as propane. Propane is a clean-burning alternative fuel which is adequately regulated under existing state and federal laws and independent safety codes and standards. As you probably know, I am a co-sponsor of S. 880 just introduced by Senator Inhofe to exempt non-toxic flammable fuels from Section 112(r). However, I understand that the U.S. Court of Appeals recently stayed the June 21, 1999 effective date of this rule for propane.

What are the court's plans concerning this rule? What are EPA's plan to extend relief to propane marketers and large consumers now?

Answer. The National Propane Gas Association (NPGA) has challenged the coverage of propane under the RMP rule and has requested a stay of the requirements. The United States Court of Appeals for the District of Columbia Circuit has granted a stay until further action by the court. This means that any (large or small) facilities handling propane subject to the RMP requirements do not need to comply with the requirements at this time. Further, EPA recently proposed an exemption for any listed flammable hydrocarbon substances (e.g. propane, methane, butane, acetylene) used or stored for use as a fuel in quantities up to 67,000 pounds (18,000 gallons). In addition, EPA stayed the RMP requirements for facilities handling less than 67,000 pounds of a listed flammable hydrocarbon as a fuel until the proposal is finalized.

At the House Appropriations Subcommittee on VA/HUD and Independent Agencies hearing in April 1999, you testified that EPA intends to increase the regulatory threshold for propane to 18,000 gallons. At the hearing, you also indicated that it didn't matter who held this amount in order to qualify. But in EPA's April 20 press release you announced that the threshold is only being increased to 16,750 gallons and that EPA's intent is not to provide any relief to marketers. I am confused by this inconsistency.

Question. Please clarify what are EPA's plans on the regulatory threshold and the impact on propane marketers.

Answer. The 18,000 gallon (67,000 pounds of propane) cut-off is derived by considering a number of factors. Large quantities of flammable hydrocarbon fuel are more likely to generate a vapor cloud explosion in a catastrophic accidental release. A large enough vapor cloud explosion is more likely to impact the public offsite; this is EPA's area of concern. EPA has considerable accident data on propane that shows that while accidental releases of small quantities can and sometimes do result in significant on-site property damage and/or deaths and injuries to workers or first responders on-site, they generally do not cause off-site impacts. EPA modeled typical fuel use conditions to calculate the outcome associated with a catastrophic accidental release. Using modeling assumptions such as fraction flashed after a release, mass of fuel in a vapor cloud, and the explosive yield factor associated with a fuel/air explosion, EPA calculated the fuel mass that could generate harm off-site. Since the vast majority of fuel processes covered under the RMP rule use propane, EPA then reviewed the sizes of widely-used propane tanks and set the cut-off to coincide with the tank size closest to the quantity derived from the blast modeling. EPA believes that 18,000 gallons (67,000 pounds of propane) represents a reasonable upper limit for the exemption. This limit is also consistent with accident history which generally indicates that flammable substance accidents with serious off-site consequences most often occur at sites handling large quantities.

A user or dealer with a storage tank or multiple tanks holding more than 18,000 gallons subject to the RMP requirements needs to complete a hazard assessment (worst case and alternative scenarios and 5 year accident history), make sure an accident prevention program is in-place, make sure an up-to-date emergency response plan is in-place, and fill-out and submit an RMP form. As mentioned above, free software and guides are available for preparing the hazard assessment. A facility that has had no accidents in the past 5 years can complete this portion quickly. For the accident prevention program, a facility that is already in compliance with safety codes and standards (such as National Fire Protection Association [NFPA] standard 58 for liquefied petroleum gas) has nearly all the elements in place for safe operation. The user or dealer will need to make sure these elements are up-to-date and add accident prevention elements that are not addressed by industry codes and standards, such as written operating procedures. Finally, an emergency response plan should already be in place and coordinated with the local fire department; if not, it will need to be prepared. All that's left is to fill in the blank or check off the box RMP form and submit it to EPA. The form must be submitted once every 5 years, unless major modifications are made at the facility that affect the hazards or prevention program. EPA estimated that a facility would likely spend about \$231 to \$1,679 to prepare an RMP and supporting on-site documentation, assuming the facility was already in compliance with existing codes, standards and industry safe-

ty practices. Since the RMP need only be submitted once every 5 years, the annualized cost is about \$46 to \$336.

Even though I support public access to information on the Internet, I also have concerns about the nature and quality of the information being provided on the Internet.

Question. Given there is some potential for this type of information falling into the wrong hands, such as potential terrorists, what is EPA's position on releasing information from these Risk Management Plans on the Internet? How will EPA protect this information from Freedom of Information Requests?

Answer. I agree current FOIA laws require EPA to provide the RMP Offsite Consequence Analysis (OCA) data in electronic format, if requested. To address this concern, an interagency workgroup drafted legislation to exempt OCA data from FOIA. The draft bill entitled "Chemical Safety Information and Site Security Act of 1999" was transmitted to Congress on May 7th. EPA staff continue to provide technical assistance to Congressional staff who are pursuing a legislative solution to your concerns. It is my hope that these ongoing discussions will lead to the passage of legislation in the immediate future.

LOW SULFUR GASOLINE PROPOSED RULE

Question. I am very interested about EPA's proposed regulation to require nationwide production of low sulfur concentrations in gasoline. I do not understand why the people of Montana need to shift to low sulfur gasoline given we do not have a problem with sulfur emissions in our state. Why does EPA believe that a national standard for burning low sulfur in gasoline is warranted when sulfur non-attainment is inconsistent across the nation? What flexibilities do states with responsibility for managing their own air quality program, such as Montana, have to adjust sulfur concentrations in gasoline? Why not provide flexibility to the states to determine the regional level of sulfur needed in gasoline to meet local markets and local non-attainment problems as you are proposing under the regional haze rule?

I am also interested about how sulfur concentrations in gasoline affect catalytic converters. If an automobile drives from a region burning low sulfur gasoline to another region burning high sulfur gasoline and returns to the low sulfur region, will the catalytic converter revert to its original performance in a reasonable period of time? Given that California, a low sulfur gasoline state, is surrounded by high sulfur gasoline states, what has been their experience with vehicles failing emissions tests due to burning high sulfur gasoline purchased while traveling in other states?

Five small refineries in California either have closed or have stopped producing gasoline since California adopted its low sulfur gasoline standard. What information does EPA have regarding the effect of these refinery closures or market withdrawals on consumer gasoline prices in California? How can EPA be confident that closures will not affect consumer prices in areas where all refineries are small by industry standards?

STAPPA/ALAPCO has stated that the combined Tier 2 and gasoline sulfur rule will be equivalent of taking 54 million automobiles off the road. Does EPA agree or disagree with this estimate? What is EPA's estimate and reasoning for the change in automobile use due to this proposed rule? Please provide your estimate and reasoning by state showing the number of equivalent cars taken off the road due to (a) improved automobile emissions technology; (b) reduced sulfur content of gasoline to 30 ppm; and (c) being Tier vehicles, Tier I vehicles, LEV/ULEV vehicles, and Tier 2 vehicles.

Answer. EPA proposed Tier 2 and low sulfur gasoline standards on May 1, 1999. Without significant new controls on motor vehicle emissions, millions of Americans will continue to breathe unhealthy air. The Tier 2 emission standards and lower-sulfur gasoline would help achieve this goal. Gasoline sulfur is a catalyst poison and high sulfur levels in commercial gasoline could affect the ability of future automobiles to meet more stringent standards. Sulfur in gasoline reduces the effectiveness of a vehicle's emission control system. Lower sulfur gasoline is also important in order to enable the introduction of advanced technologies that promise higher fuel economy but are very susceptible to sulfur poisoning (for example, gasoline direct injection engines). Therefore, low-sulfur gasoline is needed to effectively reduce pollution and to achieve the full performance of vehicle emission control technologies.

The focus of the proposed controls on gasoline sulfur content is to reduce ambient levels of ozone and PM, not sulfur emissions, nor compliance with the NAAQS for sulfur dioxide directly. EPA proposed these gasoline sulfur controls nationwide in part because there are areas in both the East and West which have problems with attaining or maintaining the ozone and PM NAAQS and which experience restricted visibility as a result of haze. Also, nationwide standards were proposed because high

levels of sulfur can have a permanent effect on the efficiency of vehicle emission control systems. Sulfur attaches to and penetrates the active materials of automotive catalysts, which provide most of the control of automotive emissions currently being achieved. The most efficient catalyst systems available currently and those being developed for the next generation of emission control, such as those capable of meeting the proposed Tier 2 emission standards, are more sensitive to sulfur than catalysts used in the 1980's and early 1990's. In addition to losing much of their effectiveness when exposed to high sulfur levels, these catalysts do not always return to their original level of effectiveness after the use of high sulfur fuel ceases. Even one tankful of high sulfur gasoline can cause irreversible damage to these catalysts. EPA expects that vehicles designed to meet the proposed Tier 2 standards will show an even more irreversible sulfur effect than those designed to meet today's California and Federal low emission vehicle standards. Given the fact that vehicles are quite mobile and that popular vacation areas exist in the western U.S., nationwide sulfur control is necessary to ensure that vehicles operating in the worst ozone areas in the eastern U.S. emit at the emission levels for which they were designed. California has strongly encouraged EPA to implement nationwide sulfur controls precisely because their own vehicles are being permanently disabled by using high sulfur fuel in neighboring states and because out-of-state vehicles coming into California are emitting above their certified emission levels because of operation on high sulfur fuel.

The proposed emission reductions from this rule would provide much-needed assistance to states facing ozone and PM air pollution problems. When fully effective in 2030, the proposed tailpipe standards would significantly reduce NO_x emissions from vehicles by about 74 percent and particulate matter emissions by about 84 percent compared to emission levels of current vehicles. The reductions in NO_x and SO_x emissions from the proposed program would also reduce secondary ambient sulfate and nitrate PM which are formed from these gaseous emissions. The nation's refiners would meet an average sulfur level of 30 parts per million (ppm) by 2004, down from the current average of more than 300 ppm. The maximum amount of sulfur in gasoline, for purposes of averaging, would be capped at 80 ppm, after a three-year phase-in. EPA estimates the cost of reducing sulfur levels to 30 ppm nationwide would be about 1–2 cents per gallon. Under Section 211 of the Clean Air Act, a state could adopt the same standard as established by EPA, or it could, under certain conditions, establish a more stringent standard. However, once EPA regulates the sulfur content of gasoline, a state could not adopt a less stringent standard. A uniform nationwide standard is supported by the fact that motor vehicles can and do travel throughout the country and catalytic converters of current and future vehicles will be detrimentally impacted by high sulfur levels in gasoline.

As part of these proposed new standards, EPA has included several measures to ensure maximum flexibility and cost-effectiveness. These flexibilities include: (1) allowing averaging to meet both the car emission and gasoline sulfur standards; (2) allowing extra time for larger vehicles between 6000 and 8500 pounds and smaller refiners to meet their respective standards; and (3) allowing for a market-based credit trading-and-banking system for both industries to reward those who lead the way in reducing pollution. The proposal includes special considerations for small refiners (defined in the proposal as those who employ no more than 1,500 employees), such as those in Montana, which would have an additional four years (until 2008) to comply with the proposed sulfur standards. If necessary, small refiners that demonstrate a severe economic hardship could apply for an additional extension of up to two years. In developing this proposal, EPA worked closely with small refiners located throughout the United States and convened a Small Business Advocacy Panel to collect information about companies which meet the Small Business Administration's definition of a small gasoline producer. Montana Refining was very active in the Advocacy Panel process and would likely benefit from the proposed small refiner provisions. The proposed sulfur averaging provisions should also provide significant flexibility to small refineries owned by large companies.

California's reformulated gasoline program, put in place in 1996, controls many gasoline properties beyond sulfur levels. The sulfur requirements, while significant, were responsible for about one third of the total costs and even less of the capital investments needed to meet the California requirements. While there were refinery closures in California in the 90's, most of these refineries closed prior to 1996. There are many reasons for these closings, including lost access to a reliable source of cheap crude oil and overcapacity. The price differential between gasoline sold in California and elsewhere is due in part to the supply and demand of California gasoline and the difficulty of obtaining it from sources outside the state. A nationwide sulfur control program would help alleviate this concern in California and other markets across the country. We believe the sulfur control provisions, especially

those applicable to small refiners, are reasonable and do not anticipate any refinery closures or disruption in fuel supply attributed to this proposal.

Our estimate for comparing the Tier 2/gasoline sulfur proposal emission reductions to emissions from vehicles removed from operation differs from the estimate provided by STAPPA/ALAPCO. By 2020, we project that the NO_x emission reductions due to the proposed Tier 2 and sulfur standards will be the equivalent of removing 166 million baseline light-duty vehicles and trucks from the road. Of this total, we project the equivalent of 69 million cars and trucks would be removed due to sulfur control alone. We developed these figures by comparing the emission rates of vehicles estimated to be in the 2020 fleet with and without the effects of the Tier 2/gasoline sulfur proposal. These reductions reflect only the 47-state region defined by the U.S. minus California, Alaska and Hawaii; since emission reductions are also projected in these states, the nationwide total will be higher. In 2020, we estimate that Tier 2 cars and trucks will account for approximately 95 percent of all miles traveled by cars and trucks. NLEV cars and trucks will account for 2.8 percent, and Tier 1 cars and trucks will account for 2.2 percent.

CLEAN WATER ACTION PLAN: USDA AND EPA DRAFT STRATEGY ON ANIMAL FEEDING OPERATIONS

Question. Recently USDA in conjunction with EPA unveiled their draft strategy for the Clean Water Action Plan. This Plan seeks to address the “problem” of animal waste management in animal feeding operations and essentially develop an approach to reduce phosphorous levels in livestock waste. This proposed plan potentially has major impacts on Montana producers because it will affect not only feedlot operators but any producer who houses an animal in a corral for an extended period of time. This includes producers who work with beef cattle, dairy cattle, swine, poultry, and even horses. In this time of depressed market prices and poor cash reserves by livestock producers, they do not need more regulatory burdens.

Answer. The USDA–EPA Unified National Strategy for Animal Feeding Operations (AFOs) was issued in final form by the Vice President on March 9, 1999. The Strategy is one of over 100 action items included in the President’s Clean Water Action Plan, issued in February 1998. The Strategy reflects a balanced and appropriate use of programs and authorities to address water quality and public health problems caused by AFOs.

The Strategy does not change EPA’s existing regulations for AFOs. Rather, the Strategy sets forth a range of flexible, common-sense steps that USDA and EPA plan to take, under existing legal and most under existing regulatory authority, to minimize the water quality and public health impacts of improperly managed animal wastes while complementing the long-term sustainability of livestock production. As indicated in the Strategy, EPA plans to review and revise its regulations related to CAFOs. This regulatory review and revision will be conducted in accordance with applicable legal and regulatory requirements.

The Strategy relies heavily on the stewardship ethic of producers and is based on a national performance expectation that all AFO owners and operators should develop and implement technically sound, economically feasible, and site-specific “comprehensive nutrient management plans” (CNMPs) for managing the animal wastes produced at their facilities. These CNMPs will include actions to prevent or reduce runoff and result in better management of the estimated 1.37 billion tons of manure produced each year. We expect that the large majority of AFOs, particularly the small AFOs, will not be subject to federal regulatory requirements, but rather will be encouraged to voluntarily adopt CNMPs to ensure proper manure management.

EPA’s regulatory definitions of AFOs and concentrated animal feeding operations (CAFOs) were established in 1976 and are given at 40 CFR 122.23 and Part 122, Appendix B. These regulations define an AFO as a facility that meets the following criteria:

- Animals have been, are, or will be stabled or confined and fed or maintained for a total of 45 days or more in any 12-month period, and
 - Crops, vegetation, forage growth, or post-harvest residues are not sustained in the normal growing season over any portion of the lot or facility.
- The Federal regulations further define a CAFO generally as an AFO that:
- Confines more than 1,000 animal units (AUs); or
 - Confines 301 to 1,000 AU and discharges pollutants:
 - Into waters of the United States through a man-made ditch, flushing system, or similar man-made device; or
 - Directly into waters of the United States that originate outside of and pass over, across, or through the facility or otherwise come into direct contact with the animals confined in the operation.

In addition, the permitting authority (i.e., EPA or an NPDES authorized State) can designate an AFO as a CAFO upon determining that the operation is a significant contributor of pollution to waters of the United States. This determination, which takes a number of factors into account (e.g., slope, vegetation, and the proximity of the operation to the waters), is based on an on-site inspection by the agency that issues NPDES permits.

An area where a producer “houses an animal in a corral for an extended period of time” would qualify as an AFO or CAFO only if it meets these regulatory definitions.

Question. What is the scientific basis of this “problem” in managing animal wastes?

Answer. As a result of domestic and export market forces, technological changes, and industry adaptations, the past several decades have seen substantial changes in America’s animal production industries. These factors have promoted expansion of confined production units, with growth in both existing areas and new areas; integration and concentration of some of the industries; geographic separation of animal production and feed production operations; and the concentration of large quantities of manure and wastewater on farms and in some watersheds.

In terms of production, the total number of animal units (AUs) in the U.S. increased by about 4.5 million (approximately three percent) between 1987 and 1992. During this same period, however, the number of AFOs decreased, indicating a consolidation within the industry overall and greater production from fewer, larger AFOs.

AFOs can pose a number of risks to water quality and public health, mainly because of the amount of animal manure and wastewater they generate. Manure and wastewater from AFOs have the potential to contribute pollutants such as nutrients (e.g., nitrogen, phosphorus), sediment, pathogens, heavy metals, hormones, antibiotics, and ammonia to the environment. Excess nutrients in water can result in or contribute to eutrophication, anoxia (i.e., low levels of dissolved oxygen), and, in combination with other circumstances, have been associated with outbreaks of microbes such as *Pfiesteria piscicida*.

Pathogens, such as *Cryptosporidium*, have been linked to impairments in drinking water supplies and threats to human health. Pathogens in manure can create a food safety concern if manure is applied directly to crops at inappropriate times. In addition, pathogens are responsible for some shellfish bed closures. Nitrogen, in the form of nitrate, can contaminate drinking water supplies drawn from ground water. Nutrients can also cause toxic algal blooms which may be harmful to human health.

EPA is working to develop better scientific data and to better assess the scope of the problem of improperly managed animal waste both nationally and regionally. There are, however, a number of reports and studies and other compelling evidence to indicate that water pollution from AFOs is a significant water quality problem. This information falls generally into four broad categories:

(1) The States continue to report that on a national level, polluted runoff from agriculture is a leading source of impairment in both rivers and lakes. Although sub-categories for agriculture are not broken out for all States, 22 States did voluntarily report that feedlots and animal holding areas impair about 35,000 river miles, or 20 percent of impaired river miles nationwide.

(2) Numerous peer-reviewed papers and case studies demonstrate the impact animal feeding operations can have on water quality. These studies indicate that at the farm and watershed level, animal feeding operations can impact water quality. These impacts usually result from the cumulative over-application of manure from numerous farms in a watershed and can result in increases of nutrients and pathogens in waterways.

(3) While cumulative small additions of nutrients and pathogens can impair water quality, it is the large catastrophic events which attract the most attention. The well-publicized North Carolina lagoon spills in 1995 are unfortunate examples of how large amounts of animal waste, if not properly managed, can severely impact a waterbody.

(4) There are also other areas where animal feeding operations have been identified as a potential source of the problem. AFOs have been identified as a possible contributing factor in the outbreaks of *Pfiesteria* in both North Carolina and Maryland during the summer of 1997 and *Cryptosporidium* in Milwaukee’s drinking water system in 1993.

Question. How will EPA take into consideration the economic impacts of this proposed plan on agricultural producers to avoid putting farmers and ranchers out of business. Finally, what financial relief can EPA provide Montana’s farmers and ranchers to meet the Clean Water Action Plan? How can they apply for this relief?

Answer. The Unified AFO Strategy is not a new regulation and does not in itself impose any binding requirements or economic burden on producers. Instead, the Strategy describes a range of actions that USDA and EPA plan to take to address the water quality and public health impacts from AFOs. These actions will have to meet applicable legal and regulatory requirements. For example, EPA is currently in the process of reviewing and revising the existing regulations and expects to propose changes in the near future. Consistent with small business analysis requirements, EPA will evaluate the impacts of projected costs on facilities that are small businesses. EPA will also evaluate the economic impacts of any new regulations on larger operations. Both of these analyses will address the major species of livestock.

Currently, EPA's policy is to treat only AFOs that meet regulatory definition of a CAFO or have been designated CAFOs as point sources subject to the NPDES program. Other AFOs may be eligible to receive financial assistance through EPA grant and loan programs such as the CWA Section 319 nonpoint source program and the Clean Water State Revolving Loan program. AFOs may also be eligible for assistance from several USDA programs including the Environmental Quality Incentives Program. Facilities, including CAFOs, that are subject to permitting under EPA's existing regulations are generally not able to receive financial assistance from EPA to comply with their permit requirements. The Unified AFO Strategy does, however, describe two types of incentives which can allow certain CAFOs to exit the regulatory program and work to stay out of the regulatory program.

First, the Strategy states our view that smaller CAFOs (those with fewer than 1,000 AUs) should be allowed to exit the permit program after the end of their permit term (which is a period of five years from the date the permit is issued) if they meet certain conditions. To exit the program, a facility would be expected to demonstrate that it has successfully addressed the conditions that caused it to be defined or designated as a CAFO and that it is fully implementing its Comprehensive Nutrient Management Plan (CNMP) and would be expected to offer evidence that it is in full compliance with its permit at the end of the permit term.

Second, AFOs with less than 1,000 AUs may in many cases be taking early voluntary actions in good faith to manage animal wastes in accordance with a CNMP. Specifically, some AFOs that are voluntarily implementing a CNMP may have a discharge that makes them subject to being designated as CAFOs under the NPDES permitting program, but does not cause them to be included in the permitting priorities described in the Strategy. The Strategy states that NPDES permitting authorities should consider providing an opportunity for these AFOs to address the cause of the discharge before designating them as CAFOs.

FOOD SAFETY

Question. As you know, we are facing extreme problems in the agricultural industry, especially in Montana. During the 1990's, farmers have made only a 4 percent return while retail food chains have made 18 percent, food processors made 17 percent, and even agricultural banks are receiving a 11 percent return. Since 1984, consumer prices for food has risen 3 percent while the price paid to farmers has fallen by 36 percent. Now we are facing a potential drought in eastern Montana. All of these factors are compounded when agricultural chemical products are changing with reregistrations. Even though I agree safer, less toxic pesticides should be used, how do you consider the economic impacts of this struggling agricultural industry in making your decision on pesticide reregistration?

Answer. Last year Vice President Gore responded to growers' concerns about the effects of the Food Quality Protection Act (FQPA) by asking the Environmental Protection Agency (EPA) and the U.S. Department of Agriculture (USDA) to convene a committee of stakeholders to assist the government in developing a process for conducting tolerance reassessment that is required by the new law. The process must incorporate four principles: sound science, transparency, consultation with stakeholders, and reasonable transition for agriculture. In consultation with the Tolerance Reassessment Advisory Committee (TRAC), EPA and USDA identified nine science policy areas where EPA needed to explain how it will make risk assessments, began to explore risk management issues, and initiated a pilot process for conducting the tolerance reassessments of the organophosphate pesticides.

EPA's Commitment to an Open Process for Developing FQPA Policies

Taking the TRAC's advice, the Agency has made its pesticide risk assessment and risk management processes and science policy development far more accessible to the public through notice and comment procedures. The Agency has created an Internet site providing access to the same information made available at the TRAC meetings, including the science policy papers on tolerance reassessment and risk management. EPA also created an Internet site with up-to-date information on the

organophosphate pesticides, including the schedule for tolerance reassessment and individual preliminary risk assessments. These webpages enable the Agency to keep the public informed of each step in the tolerance reassessment process and entry-points for participation. These websites can be accessed at <http://www.epa.gov/pesticides>.

EPA's Commitment to an Open Process for Making Tolerance Reassessment Decisions

With the help of the TRAC members, EPA and USDA have laid out this pilot process for the organophosphate pesticides, complete with self-imposed deadlines for releasing the preliminary risk assessments, further refining the risk assessments, and providing for public participation on risk mitigation measures and practical transition strategies. In making decisions on tolerances, EPA relies on actual data generated by the registrant, other agencies such as USDA, from peer reviewed scientific literature, and from growers and other pesticide users—not on default values based on worst-case assumptions.

In many cases, the comment process is providing additional health and environmental effects data, use data, or other relevant information which EPA is using to refine the risk assessments. EPA has compiled organophosphate use and usage information for some crops and posted it on the Agency's website. We expect to begin a public comment period on risk management for the first of the organophosphate pesticides later this spring or in early summer. The comment period will allow for discussion and examination of both risk mitigation measures and possible transition processes to alternative pest control approaches where needed. EPA and USDA are working on the best ways to start this phase of organophosphate tolerance reassessment and will be consulting with the TRAC.

At the same time that we are issuing the preliminary risk assessments and developing the risk management process for individual organophosphate pesticides, we are also developing a method for calculating cumulative risk for the organophosphate pesticides as a group. We expect to issue this draft methodology for rigorous external scientific peer review and full public comment later in the year. In the meantime, the Agency will continue to make registration and tolerance reassessment decisions on individual active ingredients based on sound science.

EPA's Commitment to a Reasonable Transition for Agriculture

One of Vice President Gore's four principles is to provide for a reasonable transition for agriculture. FQPA imposes more stringent standards for pesticide use in food and feed crop production, and the Agency recognizes that how it implements the law may have important and far reaching consequences. This statute, while helping to ensure a high level of food safety, has the potential to create uncertainty for agricultural producers, both in the short and long term.

Expedited Review for Safer Pesticides.—FQPA reinforced EPA's commitment to bringing new and safer technologies to the marketplace to reduce the potential risks from pesticide exposures while helping to maintain an abundant and safe food supply. To be sure that pesticide users have access to a range of safer pest control tools, the Agency is expediting review of pesticides which might be used as alternatives to riskier pesticides. As you may know, the Agency had created a new reduced-risk pesticide registration program to facilitate this effort before FQPA was enacted. This expedited review includes new active ingredients and new uses of currently registered pesticides that reduce risks to human health or the environment. In a notice sent to all registrants in August 1998, EPA explained its policy for the prioritization and expedited review of applications for new active ingredients which can be used as alternatives to organophosphate pesticides, and new use registration applications for alternative, conventional pesticides. Of 27 new pesticide active ingredients registered in fiscal year 1998, 14 were done as a result of expedited review.

Minor Uses and Other Special Situations.—EPA is focusing on reducing the risks of existing pesticides in a manner that is least disruptive to growers. Many existing pesticides will almost certainly be found to meet the new standard. However, when the risk of a pesticide is above the safety standard set by law, EPA must take regulatory action to manage the risk. The Agency has identified a range of regulatory approaches for achieving risk management; the most appropriate approach is dependent upon the level of risk. Working with USDA, it is our goal to ensure a smooth transition process that is the least disruptive to growers. The Agency is particularly conscious of the potential impacts on minor crop growers and integrated pest management programs and will continue to work with growers and registrants to focus attention on those situations where limited crop protection alternatives exist. The final TRAC meetings will focus on formulating ways to gain grower input on practical, feasible, and affordable mitigation measures. The Agency will also be

seeking input from grower groups to identify potential organophosphate pesticide alternatives for their crops. EPA's risk assessments will attempt to identify those crops/uses that contribute most to the risk, so that the Agency, USDA, and growers can work together to devise real and sensible solutions.

USDA's Role in Transition to Safer Pest Management

Because of its contacts and ability to interact more readily with the agricultural community, USDA has taken a large role in developing transition strategies. USDA is devoting significant effort and is requesting additional funding in its fiscal year 2000 budget to help grower groups develop strategies that will result in reduced risk but still ensure adequate pest control. One possible strategy for enhancing public participation is the idea of holding informational or technical briefings for interested parties, including commodity groups that may be directly affected by the findings for a selected pesticide or group of pesticides.

Regional Centers for Education and Outreach.—To promote the advance of pest management to ensure a safe, nutritious, and economical food supply for the American public, USDA is establishing Regional Pest Management Centers. Since crops, pests, and weather patterns differ from region to region within the United States, no single, national approach to pest management is appropriate across all the agricultural regions. Also, it is economically inefficient and not appropriate for every state within similar production regions to organize and support repetitive, and often competing, pest management program efforts. A viable solution to this dilemma is the development of regional pest management centers based on similarity of cropping patterns, pest problems and environmental conditions.

Pest Management Centers would be organized in eight different agricultural regions of the country. These centers would be located at existing land-grant universities or other appropriate facilities such that no new infrastructure would be required. Among the activities carried out by such centers would be to: (1) develop and evaluate new agricultural pest management technologies; (2) identify and organize pest management expertise within the regions to ensure rapid response capability for pest problems or public information needs; (3) organize and deliver pest management educational programs for agricultural producers as well as consumers; (4) provide science-based, regionally-specific input for public policy and regulatory issues; and (5) manage and report on pest management research projects within the region.

Three Research and Education Programs.—One of the first activities of the Centers would be to carry out, on a regional basis, the USDA research and education plan for helping growers overcome changes from the implementation of FQPA. The USDA research and education plan has three components: (1) The Pest Management Alternatives Program (PMAP), a program to develop replacement tactics and technologies for pesticides under consideration for cancellation or use restrictions by EPA. The focus of this program, which was established in 1996, is primarily towards replacement of individual chemicals in a pest management program on a crop by crop basis. PMAP is structured to fund short term (1–2 years) projects aimed at adaptive research and implementation of tactics that have shown promise in previous testing; (2) New Pest Management Strategies Contributing to Crop Productivity, a research and implementation program, proposed to begin in 2000, for several crops which face potentially severe economic constraints resulting from loss of certain pesticides through implementation of FQPA. Development of new multiple-tactic pest management strategies to help ensure economic viability and productivity of food crops will be the goal of the program; and (3) Reducing Risk in Major Food Crop Production Systems, a new approach to risk reduction with a food and grain production system focus, integrating food safety and water quality considerations as impacted by FQPA. The program is also proposed to begin in 2000 and will involve the major acreage crops including corn, soybean, wheat, cotton and rice as well as the fruits and vegetables most important in the diets of infants and children. The program goal is to eliminate pesticide residues in food crops and drinking water.

Question. How does EPA coordinate economic impact assessments on the agricultural industry due to pesticide reregistrations with USDA and FDA?

Answer. EPA establishes tolerances under the Federal Food Drug and Cosmetic Act (FFDCA). Cost/benefit analysis is not required for regulations made under FFDCA authority. Although the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) is a risk/benefit statute, the Agency does not explicitly analyze costs and benefits except in formal cancellation proceedings. Should the Agency propose to take formal action (under Section 6 of FIFRA) it is required to consult with USDA regarding actions against agricultural pesticides and with the Secretary of Health and Human Services (HHS) regarding public health pesticides.

EPA has a number of formal and informal links with USDA to coordinate our fact-finding and regulatory efforts. During development of significant reregistration and tolerance reassessment actions, such as those affecting organophosphate pesticides, EPA works closely with USDA to obtain information on "real-life" exposure, potential impacts of regulatory options, and the availability of alternative methods of pest control. EPA also strongly encourages pesticide and agricultural producers to provide similar information to USDA and EPA. Efforts with HHS are well underway to develop a Memorandum of Understanding which will outline how EPA and HHS will consult on actions that may impact public health pesticides. As with agricultural pesticides, EPA has worked with industry and State offices, such as mosquito control boards, to help assess the potential impact of any actions on this important class of pesticides.

Question. Finally, how are you ensuring that the quality of imported agricultural products are safe for consumption, especially imported beef from Canada?

Answer. Authority for the safety of imported meat is spread among three Federal agencies. EPA establishes tolerances for pesticide residues under the FFDCA while FDA monitors imports for compliance with FFDCA requirements. USDA sets and monitors quality standards for meat, including hygienic standards.

Differences in the regulation of pesticide residues in food can be a trade issue. These concerns are being addressed with our North American Free Trade Act (NAFTA) partners. Cooperative U.S./Canada bilateral efforts on pesticides regulatory harmonization were expanded in 1996 to include Mexico through the NAFTA Technical Working Group (TWG) on Pesticides. The goal of the TWG is to develop a coordinated pesticides regulatory framework among NAFTA partners to address trade irritants, build national regulatory scientific capacity, share the review burden, and coordinate scientific and regulatory decisions on pesticides. This work has already begun to pay dividends by addressing specific trade irritants, such as national differences in Maximum Residue Limits (MRLs, or tolerances), developing a better understanding of each regulatory agency's assessment practices, working to harmonize each country's procedures and requirements, and encouraging pesticide registrants (product owners) to make coordinated data submissions to the three NAFTA countries to facilitate joint reviews.

TRIBAL SUPPORT

Question. I understand that you are requesting a total of \$166 million for support to Tribal governments. Also I understand that you are working to improve the capacity of tribes to manage their own environmental programs. Since Montana has eight Federally-recognized tribes which I strongly support. What is your assessment of the environmental conditions of their tribal lands?

Answer. EPA is assisting Montana's federally-recognized tribes to build the capacity to manage their own programs for environmental protection of their lands, similar to our efforts to help states build the capacity in the early years of the Agency. In addition, EPA has the statutory responsibility to protect public health and the environment on Indian reservations. Environmental conditions vary from reservation to reservation, but overall the condition of the Montana tribes' environment range from poor to good, with impacts from improper disposal of solid wastes, drinking water and wastewater impacts due to a lack of infrastructure and a lack of operations & maintenance, mining impacts, oilfield contamination, and non-point source pollution the most prevalent.

Question. What environmental problems are they having to manage on their lands?

Answer. Environmental problems vary from reservation to reservation, but some of the problems Montana tribes are experiencing include disposal of solid wastes, pollution and other impacts from mining, surface water pollution, and infrastructure needs for drinking water and wastewater treatment systems. There is also the problem of air pollution from off-reservation sources.

Question. What type of financial and technical assistance can you provide to them to help address their environmental problems?

Answer. Though a variety of mechanisms in addition to broad based multi-media funding under the General Assistance Program (GAP), Tribes are eligible for assistance under the Drinking Water and State Revolving Fund Programs, as well as other standing Grant Programs (Sect 319, PWSS, WQCA, Wetlands, UIC, 106).

Question. I understand that EPA is proposing a 20 percent set-aside in the Clean Water State Revolving Fund for Indian tribes to use for nonpoint source problems and other water quality problems. Does this require statutory changes and, if so, when will we get to review your proposed legislation? Why have the tribes not availed themselves of State Revolving Fund loans that the states can provide?

Answer. The President's proposal would allow states to use up to 20 percent of their fiscal year 2000 Clean Water State Revolving Fund (CWSRF) capitalization grants for grants for nonpoint source pollution control projects. Indian tribes do not receive capitalization grants because the Clean Water Act does not authorize CWSRFs for tribes. The tribes do, however, receive 0.5 percent of the CWSRF appropriation for use as wastewater grants. Tribes can also apply to states for CWSRF loans, as can any municipality, as long as they meet fiscal management and regulatory requirements. To date no tribe has received a CWSRF loan. One reason is that all loan recipients are required to have dedicated sources of revenue for loan repayments. Many tribes do not have revenue sources with which to repay the loan. Tribes prefer instead to receive grants, which require no repayment, to address their water quality problems. Another reason is that many tribes view themselves as sovereign nations, with authority equal to that of states. Their preference is to work with the U.S. government on a government-to-government basis, as opposed to working through the states. Tribes would face state oversight requirements when applying to states for nonpoint source pollution control grants from the optional CWSRF 20 percent set-aside.

If Congress adopts the President's proposal, implementing language would be required in the fiscal year 2000 Appropriation Act. Such language is proposed in the Appendix of the fiscal year 2000 President's Budget, pages 930—931, as follows:

“* * * for fiscal year 2000, each State may reserve from funds in its Clean Water State Revolving Fund, an amount equal to no more than 20 percent of the sums allotted to such State under section 604 of the Federal Water Pollution Control Act to provide grants of no more than 60 percent of the costs of projects eligible under section 603 (2) or (3) of such Act. Such grants may not be made for publicly-owned treatment works as defined in section 212 of that Act. Projects receiving grant assistance must, to the maximum extent practicable, rank highest on the State's priority list that is used to prioritize projects eligible for assistance under section 603 of that Act.”

QUESTIONS SUBMITTED BY SENATOR SHELBY

GRANDFATHER REGULATION: ENVIRONMENTAL DEFENSE FUND VS. EPA

Question. Administrator Browner, it is my understanding that a few years ago you approved the specific “grandfather” regulation that was challenged and struck down in *Environmental Defense Fund v. EPA*. Why did you choose not to appeal the recent conformity grandfathering decision? Did your viewpoint regarding this regulation change? If it did, why? Administrator Browner, did someone else, either within the Justice Department or at the White House, make the decision not to appeal?

Answer. After extensive review of the decision and discussions within the Administration, including EPA and the Departments of Transportation and Justice (DOT and DOJ), we have decided not to seek rehearing of the decision. The Administration has developed a workable approach for implementing conformity under the court's decision. We believe that a combination of guidance to states, quick action by EPA to find submitted State Implementation Plans (SIPs) adequate, and regulatory changes to our conformity rules in response to the court's remand make appeal of the court's decision or changes to the Clean Air Act unnecessary. This approach properly balances economic development with environmental protection, and minimizes any immediate disruption to transportation activities resulting from the decision.

We are committed to an approach that recognizes the importance of continued highway construction—providing local areas with as much predictability and flexibility as possible—consistent with meeting our Nation's air quality needs. EPA intends to amend the transportation conformity rules to clarify that grandfathering of previously approved projects can proceed during a conformity lapse, but only where DOT has made a full funding commitment to the project prior to the lapse. EPA believes that this is both an appropriate interpretation of the conformity requirements of the Act, and consistent with the recent court decision.

As a result of recent problems associated with implementation of the prior grandfathering regulation, especially in Atlanta, Georgia, EPA believes that grandfathering at the stage of full funding commitment is more appropriate than at the stage of NEPA review, and that grandfathering at this stage properly coordinates the twin desires of advancing transportation planning and protecting clean air.

TRANSPORTATION CONSTRUCTION PROJECTS LIST

Question. This case could have a great impact on numerous transportation construction projects. However, I am not aware of any definitive information regarding projects that are within the reach of the Court's decision. Could you provide me with the list of projects that the EPA believes that this decision affects. Could you also provide cost estimates regarding the losses that will result from the delays caused by this decision?

Can you consult with the Department of Transportation and provide the list of the immediately affected projects? And the associated project costs?

Answer. Attached please find DOT's list (as of June 15, 1999) of projects that are immediately affected by the court decision, and the associated project costs. We understand that the table entitled "Status of Grandfathered Projects in Lapsed Areas" describes in columns 1 and 2 the total universe of projects that could be affected by the court decision. The projects in columns 3 and 4 are the subset that definitely can proceed even under the terms of the court decision.

It is worth noting that among the areas where conformity has lapsed (i.e., there are conformity problems independent of the court decision), most of these areas will have ended their lapse by September 1999 at the latest (Ashland, KY; Monterey, CA; Raleigh, NC; Santa Barbara, CA; Winston-Salem, NC).

Of the areas where conformity was suspended following the court decision, most are expected to re-establish conformity within weeks (Longmont, CO; Stanislaus County, CA; Tucson, AZ). In fact, Yuma, AZ has already re-established conformity. This reduces the total project costs on DOT's table by \$53.3 million.

TRANSPORTATION CONSTRUCTION PROJECTS IMPACT

Question. Administrator Browner, while we may not yet know the exact number of projects that will be affected, we do know there will be a substantial number. Most of these projects were intended to improve transportation efficiency. The delays caused by this ruling will keep thousands, if not millions, stuck in inefficient transportation systems. Won't this have a detrimental impact on the environment?

Answer. The number of projects affected by the March 2, 1999, court decision is limited. These projects are located in areas where analysis shows that transportation plans will cause vehicle emissions to be higher than what is allowed for in the State implementation plans (SIPs) for air quality. These areas may proceed with transportation projects once they have developed transportation plans that do not cause the vehicle emissions limits of their SIPs to be exceeded. We expect most of these areas to fix their conformity problems by August 1999 which will restore nearly half of the project funding impacted. Until they do so, it is more environmentally protective and a more efficient use of resources to avoid investments that may worsen air quality over the long term. We believe that short-term delays in transportation efficiency improvements are preferable to irreversible investments in a transportation system that is incompatible with long-term attainment and maintenance of the air quality standards.

TRANSPORTATION PARTNERS PROGRAM

Question. Administrator Browner, it is my understanding that the EPA conducts the "Transportation Partner's Program." Could you please tell me about this program?

Answer. Transportation Partners is a U.S. EPA program that promotes and supports innovative, local, voluntary efforts to reduce vehicle miles traveled (VMT). Transportation Partners is one of the actions in President Clinton's Climate Change Action Plan and is responsible for reducing miles traveled by single occupancy vehicles in order to reduce greenhouse gas emissions.

The Transportation Partners program is comprised of a team of national, non-governmental organizations, called Principal Partners, who receive EPA funding to foster innovative transportation solutions nationwide. Principal Partners share EPA's commitment to decreasing greenhouse gas emissions and to mitigating environmental impacts from the transportation sector. Funds received by these organizations are used to provide technical assistance to businesses, communities, and organizations engaging in VMT reduction strategies. Transportation Partners has funded nine non-profit organizations since its founding.

In cooperation with its Principal Partners, the Transportation Partners program provides technical and networking assistance to over 300 nationwide Project Partners. Project Partners consist of national, non-governmental organizations, community-level associations, state and local governments, and businesses. Business part-

ners include WalMart, Kaiser Permanente, Bank of America, and many others. Transportation Partner examples are provided on the attachment.

Question. Are you aware of whether the EDF, the party that brought the suit in the [conformity] case, has ever received funding under this program? Could funding from this program have been used by EDF to bring the lawsuit against the EPA?

Answer. EPA has entered into cooperative agreements with EDF and other groups that have expertise in various aspects of the transportation and environmental issues. In some cases, groups which have received Federal funds are also engaged in litigation with the Federal government. EPA has strict guidelines that prevent EDF and other groups from using EPA funds to pay for these legal actions. Every EPA grant agreement is conditioned on compliance with OMB Circulars that prohibit the use of grant funds for suits against the Government. Specifically, they prohibit "costs of legal, accounting, and consultant services, and related costs, incurred in connection with * * * the prosecution of claims or appeals against the Federal Government" (OMB Circular No. A-122, Attachment B, Section 10.g, which applies to nonprofit organizations; same provision in Circular No. A-21, Section J.11.g, which applies to educational institutions) and "legal expenses for prosecution of claims against the Federal Government" (Circular No. A-87, Attachment B, Section 14.b, which applies to State, local, and tribal governments). In addition, EPA's appropriation acts provide that grant funds may not be used to pay the expenses of, or otherwise compensate, non-Federal parties intervening in regulatory or adjudicatory proceedings.

Examples of Transportation Partners Projects

Cornell University's comprehensive Transportation Demand Management Program enhanced transportation choices, reduced VMT, and saved money by eliminating the need for new parking spaces. The program combines a three-tiered rate structure for parking, transit subsidies, and coordination with local communities and transit operators to reduce approximately 10 million VMT per year and an estimated 1,450 MMTCE. The program worked with surrounding municipalities to encourage the creation of park-and-ride lots, improved and distributed transit maps, and created a "Commuter Connection" column in the local newspaper. The increased demand created by the program lead to new routes and improved service in previously underserved areas.

A Howard County, Maryland School Walkway Program has resulted in hundreds of students now walking to school. A partnership between Howard County's Department of Public Works and Department of Education has resulted in the installation of miles of new sidewalks. Before these sidewalks or missing sidewalk links were installed, students who lived within walking distance of school were forced to ride a bus for safety reasons. One 900 foot walkway enabled 141 students to walk to school, and eliminated three buses and 2,000 bus trips per year.

The City of Xenia and Green County, Ohio have teamed up with the Ohio Department of Transportation, the Ohio Department of Natural Resources, and the private sector to convert 60 miles of former railway corridors and a seven acre railroad depot into an alternative transportation center. The transportation center includes bike and pedestrian trails, parking facilities, and a community building. The trails are located within a short walk of every Xenia resident and within ten minutes of most residents in the county. It was estimated that over 300,000 people used the trails to get to work, home, school, and other activities by the end of 1997.

Kaiser Permanente of California is taking demonstrable steps to reduce pollution and traffic congestion through the KAISERider program. Throughout California, 10,500 employees at sites with the KAISERider program use alternative means of transportation, such as carpooling, on a regular basis. Four KAISERRider services alone eliminate approximate 37,000 passenger trips a month or nearly 4 million VMT per year (571 MMTCE).

The City of Oakland, California Oakland Broadway electric shuttle has revitalized a key shopping and business district. Signage and discounted merchant coupons were created to encourage the use of the shuttle, which provides workers and shoppers in the area with a quick, easy, and free way to move throughout the downtown area during lunch time hours. The total estimated annual VMT reduction for the shuttle is 237,600 which would result in an annual reduction of 34 MMTCE.

QUESTIONS SUBMITTED BY SENATOR CRAIG

CLIMATE CHANGE: KYOTO PROTOCOL IMPLEMENTATION

Question. Has EPA taken any action or programs that seek to implement the Kyoto Protocol.

Answer. No. The Administration has committed not to implement the Kyoto Protocol before the Senate has considered the Protocol and provided advice and consent to its ratification.

Question. Has EPA staff provided any formal communications to the Administration related to the Kyoto Protocol or data used to try to justify the Protocol? If so, please provide copies of these communications for the record including any EPA press releases, statements by EPA staff and documentation detailing the peer review process used prior to release of any of this data.

Answer. We understand your question as asking whether EPA has formally transmitted any scientific or economic data related to or in justification of the Kyoto Protocol to the White House or another federal Agency, through a press release or other form of public announcement. We further understand your question as asking for information on the peer review process for any such data transmitted in this way. EPA has not made any such transmittal of data to the White House or other agencies.

Question. In October 1997, the President announced a three-stage, multi-year plan to reduce greenhouse gas emissions. One element was a proposal to provide credits to companies that take voluntary action to reduce their greenhouse gas emissions. Legislation to authorize such program was introduced by Senator Chafee and others in both the 105th and 106th Congresses, but the Administration has not endorsed the Chafee legislation nor submitted its own legislation.

As part of its Green Lights and other voluntary programs, EPA requires that participating companies submit detailed information (project-by-project) on reductions. EPA spends considerable amounts of money to compile this detailed information. If a program to provide early credits were enacted, companies seeking such credits would presumably need to keep track of their reductions in order to justify their credits. If these companies were also participants in EPA's Green Lights or other voluntary programs, it is not clear that EPA would still need such detailed data. Thus, EPA might be able to reduce its funding level for Green Lights and other voluntary programs without reducing the effectiveness of these programs.

Did the President's announcement increase company willingness to invest in energy-saving equipment? Please explain by providing the necessary supporting documentation. Did it increase willingness in the business community to sign up for Green Lights and other voluntary programs?

Answer. Since the President's announcement, the rate of private sector companies and other entities (e.g., schools, state or local governments, or other non-profits) newly joining partnership programs like ENERGY STAR Buildings and Green Lights has remained about the same. EPA's voluntary climate partnerships are continuing to grow at a steady pace and the number of partnerships now exceeds 7,000.

It does appear that there may have been an increase in overall private sector investment in energy efficiency over this period, paralleling the strong general investment trend in the U.S. economy over this time.

The President's announcement did spur increased participation on the part of companies and industries who came forward to participate in consultations between industry and government about voluntary industry-by-industry commitments to reduce greenhouse gases through the industry consultation process. A significant number of new, meaningful voluntary industry commitments have been announced in this period.

For example:

- United Technologies has committed to a sales weighted reduction of greenhouse gas emissions of 25 percent below 1997 emissions levels by 2007.
- British Petroleum has agreed to reduce their greenhouse gas emissions by 10 percent below 1990 levels by 2010.
- Shell has agreed to reduce their greenhouse gas emissions 10 percent below 1990 levels by 2002.
- Dow will reduce their energy use per unit of production by 20 percent by 2005.
- Dupont will reduce their greenhouse gas emissions 40 percent below 1990 levels by 2000.
- Through their global energy conservation, product design, and perfluorocompound emission reduction goals, IBM has committed to reduce 40 percent of their PFC emissions by 2002 per unit output using a 1995 baseline in semiconductor manufacturing. They have also committed to achieve energy conservation savings each year equivalent to 4 percent of annual electric and fuel use.
- Finally, the most recent announcement came from Motorola which will reduce emissions of PFCs by 50 percent from 1995 levels by the year 2010.

Question. Can you explain why, in nearly 18 months since the President first announced the “early credits” idea, the Administration has not submitted legislation on this issue? When do [you] expect the Administration to submit such legislation?

Answer. In his State of the Union message this year, the President pledged to work with members of Congress in both parties to reward companies that take early, voluntary action to reduce greenhouse gases. Rather than submit its own bill, the Administration believes it would be most efficient and productive to work with Congress on the basis of early credit proposals that have already been introduced, such as S.547 in the Senate, and similar legislation expected to be introduced in the House.

Question. If a program to provide “early credits” were to be enacted, what changes in EPA’s voluntary programs would be appropriate? For example, would it still make sense for EPA to keep detailed company-by company, project-by-project records for EPA’s partners?

Answer. While there are many uncertainties as to how a program to provide early credits would work, it is unlikely that EPA’s voluntary programs would need significant changes. Partners in voluntary programs such as ENERGY STAR Buildings and Green Lights would need to continue to report to EPA on a company-by-company basis in order to track the company’s progress in each particular voluntary program, as well as the aggregate achievements of that program. EPA uses this company-submitted information to publicly recognize the accomplishments of companies and other organizations that make commitments under the program.

Question. How much of the \$41.3 million requested for Buildings Initiatives will be spent to compile company data?

Answer. The \$41.3 million requested to expand EPA’s Buildings Programs will not be used to compile company data for EPA’s Buildings programs. The requested funding is intended to expand partnerships and provide essential information to organizations and consumers so that they can choose equipment and products that will not only save them money but reduce pollution. Current funding levels of these programs have been and will continue to be sufficient to collect and compile data on participant activities through the program. EPA has already established an efficient system for updating an existing database with new information from program partner reports. The program partners compile and report their own data in an agreed-upon format, so a relatively small proportion of EPA’s expenditures for the voluntary programs is used for data compilation activities.

Question. Please explain why a company would need credits for greenhouse gas reductions. Does the Administration plan to put in place mandatory limits on companies combustion of fossil fuels and other activities that produce greenhouse gases? When would those limits take effect? How would company limits be determined?

Answer. As domestic and international policy developments on climate change unfold, a significant number of companies are considering whether to take actions now to reduce their greenhouse gas emissions in anticipation of a possible future market-based system to limit emissions. Many of those firms support having credits for early greenhouse gas reductions because they want to be assured that they will not be inadvertently penalized in a possible future market-based system, and that reductions they make before such a system takes effect will be appropriately recognized and rewarded. The Administration shares this view and thus supports the creation of a program for appropriately rewarding early action.

The President has put forth a plan, articulated most fully in a speech in October 1997, to responsibly and effectively address the very real and serious problem of global warming in both the domestic and international arenas. The President has proposed to proceed pragmatically in three stages. In the first stage, he has directed EPA, the Department of Energy, and other agencies to take actions that help reduce greenhouse gas emissions while providing direct and immediate benefits to the economy, primarily through encouraging voluntary emissions reductions. These actions include the Climate Change Technology Initiative (CCTI), the restructuring of the electric utility industry, and a program to give businesses appropriate credit for early reductions in greenhouse gas emissions. In the second stage of the President’s proposal, programs implemented during stage one would be reviewed, evaluated, and—depending on their success—extended. A pilot emissions trading program would be put in place and tested. The third stage of the President’s plan envisions implementation of an emissions cap and trading system—based on the successful experience with the acid rain program—to harness the power of the marketplace to limit greenhouse gas emissions as flexibly and efficiently as possible, and at the lowest possible cost. The Administration has not made any further decisions as to when such a market-based system would come into effect, or how emission limits at the company level would be determined. The Administration has pledged to work with Congress on any necessary legislation.

Question. Has EPA developed any analysis regarding the “credit for early action” legislation introduced in the Senate in the 105th Congress and the 106th Congress? If so, please provide this documentation, including a list of any recipients of this documentation.

Answer. Regarding the credit for early action legislation introduced in the Senate in the 105th and/or 106th Congress, EPA has developed two internal analyses which have been distributed to EPA staff only. In January 1999, an analysis entitled “Early Reduction Credit Proposals” was completed for Todd Stern, Special Assistant to the President for Special Projects.

Question. In EPA’s fiscal year 2000 Annual Performance Plan it stated: “EPA will * * * build a program that provides appropriate credit for early action. (Page VI–30 of EPA fiscal year 2000 submission) What is EPA’s statutory authority for developing a “credit for early action” program?

Answer. EPA stated in its fiscal year 2000 Annual Performance Plan: “[i]n 2000, EPA will expand its work with these industries to build a program that provides appropriate credit for early action.” In its recent Climate Change Report to Congress, prepared in response to Senate Appropriations Report 105–216, p. 74–75, EPA described this concept more fully, stating that “EPA will expand its work with [key energy intensive] industries and work across the Administration to help develop the basis for a program that could provide appropriate credit for early action.” This work furthers the Administration’s goals. In his January 1999, State of the Union Address, President Clinton expressed his support for the concept of providing credit for early reductions of greenhouse gases.

EPA’s statement in the fiscal year 2000 Annual Performance Plan was not intended to indicate that EPA will implement an early action credit program in fiscal year 2000, but rather that EPA will work to develop a conceptual framework for such a possible program. EPA will work with key industries to identify areas where and the means by which environmental and economic benefits could be obtained from early action to reduce greenhouse gases. EPA believes these are important first steps in considering how such a program might be structured. Information provided by energy intensive industries also provides a basis for evaluating the scope of the benefits that might be achieved through providing credits for early action.

EPA’s primary source of statutory authority for these activities is section 103(a) and (b) of the Clean Air Act. Section 103 of the Clean Air Act requires the Administrator to establish a “national research and development program for the prevention and control of air pollution.” As part of this program, section 103(a)(1) requires the Administrator to, “conduct, and promote the coordination and acceleration of, research, investigations, experiments, demonstrations, surveys, and studies relating to the causes, effects (including health and welfare effects), extent, prevention and control of air pollution.” Section 103(b) provides that in carrying out subsection (a), the Administrator is authorized to “collect and make available, through publications and other appropriate means, the results of and other information, including appropriate recommendations by him in connection therewith, pertaining to such research and other activities.” Section 103(g) of the CAA provides additional authority for some of the Agency’s activities in this area. Section 103(g) provides that in carrying out subsection (a), “the Administrator shall conduct a basic engineering research and technology program to develop, evaluate, and demonstrate nonregulatory strategies and technologies for air pollution prevention.” The program is to include among its elements, “[i]mprovements in nonregulatory strategies and technologies for preventing or reducing multiple air pollutants, including sulfur oxides, nitrogen oxides, heavy metals, PM–10 (particulate matter), carbon monoxide, and carbon dioxide, from stationary sources, including fossil fuel power plants. Such strategies and technologies shall include improvements in the relative cost effectiveness and long-range implications of various air pollutant reduction and nonregulatory control strategies such as energy conservation, including end-use efficiency, and fuel-switching to cleaner fuels.” These Clean Air Act provisions authorize EPA to explore and develop innovative, experimental approaches for prevention and control of air pollution, and an early action credit program would be one such approach.

Other statutes provide additional general authority for and/or authority for specific aspects of EPA’s activities in this area. Such statutes include: Pollution Prevention Act of 1990, 42 U.S.C. 13101 et seq.; National Environmental Policy Act of 1969, 42 U.S.C. 4321 et seq.; Global Climate Protection Act of 1987, 15 U.S.C. 2901; and Federal Technology Transfer Act, 15 U.S.C. 3710a.

CLIMATE CHANGE: GREENHOUSE GAS EMISSIONS—CREDIT FOR EARLY ACTION

Question. In October 1997, the President announced a three-stage, multi-year plan to reduce greenhouse gas emissions. One element was a proposal to provide credits

to companies that take voluntary action to reduce their greenhouse gas emissions. Legislation to authorize such program was introduced by Senator Chafee and others in both the 105th and 106th Congresses, but the Administration has not endorsed the Chafee legislation nor submitted its own legislation.

Answer. As part of its Green Lights and other voluntary programs, EPA requires that participating companies submit detailed information (project-by-project) on reductions. EPA spends considerable amounts of money to compile this detailed information. If a program to provide early credits were enacted, companies seeking such credits would presumably need to keep track of their reductions in order to justify their credits. If these companies were also participants in EPA's Green Lights or other voluntary programs, it is not clear that EPA would still need such detailed data. Thus, EPA might be able to reduce its funding level for Green Lights and other voluntary programs without reducing the effectiveness of these programs.

Question. Did the President's announcement increase company willingness to invest in energy-saving equipment? Please explain by providing the necessary supporting documentation. Did it increase willingness in the business community to sign up for Green Lights and other voluntary programs?

Answer. Since the President's announcement, the rate of private sector companies and other entities (e.g., schools, state or local governments, or other non-profits) newly joining partnership programs like ENERGY STAR Buildings and Green Lights has remained about the same. EPA's voluntary climate partnerships are continuing to grow at a steady pace and the number of partnerships now exceeds 7,000.

It does appear that there may have been an increase in overall private sector investment in energy efficiency over this period, paralleling the strong general investment trend in the U.S. economy over this time.

The President's announcement did spur increased participation on the part of companies and industries who came forward to participate in consultations between industry and government about voluntary industry-by-industry commitments to reduce greenhouse gases through the industry consultation process. A significant number of new, meaningful voluntary industry commitments have been announced in this period.

For example:

- United Technologies has committed to a sales weighted reduction of greenhouse gas emissions of 25 percent below 1997 emissions levels by 2007.
- British Petroleum has agreed to reduce their greenhouse gas emissions by 10 percent below 1990 levels by 2010.
- Shell has agreed to reduce their greenhouse gas emissions 10 percent below 1990 levels by 2002.
- Dow will reduce their energy use per unit of production by 20 percent by 2005.
- Dupont will reduce their greenhouse gas emissions 40 percent below 1990 levels by 2000.
- Through their global energy conservation, product design, and perfluorocompound emission reduction goals, IBM has committed to reduce 40 percent of their PFC emissions by 2002 per unit output using a 1995 baseline in semiconductor manufacturing. They have also committed to achieve energy conservation savings each year equivalent to 4 percent of annual electric and fuel use.
- Finally, the most recent announcement came from Motorola which will reduce emissions of PFCs by 50 percent from 1995 levels by the year 2010.

Question. Can you explain why, in nearly 18 months since the President first announced the "early credits" idea, the Administration has not submitted legislation on this issue? When do [you] expect the Administration to submit such legislation?

Answer. In his State of the Union message this year, the President pledged to work with members of Congress in both parties to reward companies that take early, voluntary action to reduce greenhouse gases. Rather than submit its own bill, the Administration believes it would be most efficient and productive to work with Congress on the basis of early credit proposals that have already been introduced, such as S.547 in the Senate, and similar legislation expected to be introduced in the House.

Question. If a program to provide "early credits" were to be enacted, what changes in EPA's voluntary programs would be appropriate? For example, would it still make sense for EPA to keep detailed company-by company, project-by-project records for EPA's partners?

Answer. While there are many uncertainties as to how a program to provide early credits would work, it is unlikely that EPA's voluntary programs would need significant changes. Partners in voluntary programs such as ENERGY STAR Buildings and Green Lights would need to continue to report to EPA on a company-by-company basis in order to track the company's progress in each particular voluntary

program, as well as the aggregate achievements of that program. EPA uses this company-submitted information to publicly recognize the accomplishments of companies and other organizations that make commitments under the program.

Question. How much of the \$41.3 million requested for Buildings Initiatives will be spent to compile company data?

Answer. The \$41.3 million requested to expand EPA's Buildings Programs will not be used to compile company data for EPA's Buildings programs. The requested funding is intended to expand partnerships and provide essential information to organizations and consumers so that they can choose equipment and products that will not only save them money but reduce pollution. Current funding levels of these programs have been and will continue to be sufficient to collect and compile data on participant activities through the program. EPA has already established an efficient system for updating an existing database with new information from program partner reports. The program partners compile and report their own data in an agreed-upon format, so a relatively small proportion of EPA's expenditures for the voluntary programs is used for data compilation activities.

Question. Please explain why a company would need credits for greenhouse gas reductions. Does the Administration plan to put in place mandatory limits on companies combustion of fossil fuels and other activities that produce greenhouse gases? When would those limits take effect? How would company limits be determined?

Answer. As domestic and international policy developments on climate change unfold, a significant number of companies are considering whether to take actions now to reduce their greenhouse gas emissions in anticipation of a possible future market-based system to limit emissions. Many of those firms support having credits for early greenhouse gas reductions because they want to be assured that they will not be inadvertently penalized in a possible future market-based system, and that reductions they make before such a system takes effect will be appropriately recognized and rewarded. The Administration shares this view and thus supports the creation of a program for appropriately rewarding early action.

The President has put forth a plan, articulated most fully in a speech in October 1997, to responsibly and effectively address the very real and serious problem of global warming in both the domestic and international arenas. The President has proposed to proceed pragmatically in three stages. In the first stage, he has directed EPA, the Department of Energy, and other agencies to take actions that help reduce greenhouse gas emissions while providing direct and immediate benefits to the economy, primarily through encouraging voluntary emissions reductions. These actions include the Climate Change Technology Initiative (CCTI), the restructuring of the electric utility industry, and a program to give businesses appropriate credit for early reductions in greenhouse gas emissions. In the second stage of the President's proposal, programs implemented during stage one would be reviewed, evaluated, and—depending on their success—extended. A pilot emissions trading program would be put in place and tested. The third stage of the President's plan envisions implementation of an emissions cap and trading system—based on the successful experience with the acid rain program—to harness the power of the marketplace to limit greenhouse gas emissions as flexibly and efficiently as possible, and at the lowest possible cost. The Administration has not made any further decisions as to when such a market-based system would come into effect, or how emission limits at the company level would be determined. The Administration has pledged to work with Congress on any necessary legislation.

Question. Has EPA developed any analysis regarding the "credit for early action" legislation introduced in the Senate in the 105th Congress and the 106th Congress? If so, please provide this documentation, including a list of any recipients of this documentation.

Answer. Regarding the credit for early action legislation introduced in the Senate in the 105th and/or 106th Congress, EPA has developed two internal analyses which have been distributed to EPA staff only. In January 1999, an analysis entitled "Early Reduction Credit Proposals" was completed for Todd Stern, Special Assistant to the President for Special Projects.

Question. In EPA's fiscal year 2000 Annual Performance Plan it stated: "EPA will * * * build a program that provides appropriate credit for early action. (Page VI-30 of EPA fiscal year 2000 submission) What is EPA's statutory authority for developing a "credit for early action" program?

Answer. EPA stated in its fiscal year 2000 Annual Performance Plan: "[i]n 2000, EPA will expand its work with these industries to build a program that provides appropriate credit for early action." In its recent Climate Change Report to Congress, prepared in response to Senate Appropriations Report 105-216, p. 74-75, EPA described this concept more fully, stating that "EPA will expand its work with [key energy intensive] industries and work across the Administration to help de-

velop the basis for a program that could provide appropriate credit for early action.” This work furthers the Administration’s goals. In his January 1999, State of the Union Address, President Clinton expressed his support for the concept of providing credit for early reductions of greenhouse gases.

EPA’s statement in the fiscal year 2000 Annual Performance Plan was not intended to indicate that EPA will implement an early action credit program in fiscal year 2000, but rather that EPA will work to develop a conceptual framework for such a possible program. EPA will work with key industries to identify areas where and the means by which environmental and economic benefits could be obtained from early action to reduce greenhouse gases. EPA believes these are important first steps in considering how such a program might be structured. Information provided by energy intensive industries also provides a basis for evaluating the scope of the benefits that might be achieved through providing credits for early action.

EPA’s primary source of statutory authority for these activities is section 103(a) and (b) of the Clean Air Act. Section 103 of the Clean Air Act requires the Administrator to establish a “national research and development program for the prevention and control of air pollution.” As part of this program, section 103(a)(1) requires the Administrator to, “conduct, and promote the coordination and acceleration of, research, investigations, experiments, demonstrations, surveys, and studies relating to the causes, effects (including health and welfare effects), extent, prevention and control of air pollution.” Section 103(b) provides that in carrying out subsection (a), the Administrator is authorized to “collect and make available, through publications and other appropriate means, the results of and other information, including appropriate recommendations by him in connection therewith, pertaining to such research and other activities.” Section 103(g) of the CAA provides additional authority for some of the Agency’s activities in this area. Section 103(g) provides that in carrying out subsection (a), “the Administrator shall conduct a basic engineering research and technology program to develop, evaluate, and demonstrate nonregulatory strategies and technologies for air pollution prevention.” The program is to include among its elements, “[i]mprovements in nonregulatory strategies and technologies for preventing or reducing multiple air pollutants, including sulfur oxides, nitrogen oxides, heavy metals, PM-10 (particulate matter), carbon monoxide, and carbon dioxide, from stationary sources, including fossil fuel power plants. Such strategies and technologies shall include improvements in the relative cost effectiveness and long-range implications of various air pollutant reduction and nonregulatory control strategies such as energy conservation, including end-use efficiency, and fuel-switching to cleaner fuels.” These Clean Air Act provisions authorize EPA to explore and develop innovative, experimental approaches for prevention and control of air pollution, and an early action credit program would be one such approach.

Other statutes provide additional general authority for and/or authority for specific aspects of EPA’s activities in this area. Such statutes include: Pollution Prevention Act of 1990, 42 U.S.C. 13101 et seq.; National Environmental Policy Act of 1969, 42 U.S.C. 4321 et seq.; Global Climate Protection Act of 1987, 15 U.S.C. 2901; and Federal Technology Transfer Act, 15 U.S.C. 3710a.

CLIMATE CHANGE: GLOBAL CLIMATE ISSUE—EPA OUTREACH

Question. Has EPA sponsored, co-sponsored, or participated in any public meetings related to the global climate issue? If so, please provide the dates of the meetings, a list of participants, copies of as delivered presentations, and any presentation material used by EPA staff or produced as a result of a grant from EPA.

Answer. Please see Attachment 1. Attachment 1 includes two lists which summarize: (1) public meetings related to the global climate issue that have been sponsored or co-sponsored by EPA; and (2) other public meetings related to the global climate issue at which EPA staff have participated as presenters and/or exhibitors. These lists include public meetings that occurred in fiscal year 1999 (10/1/98 through 3/18/99, the date of your request) and at which climate change issues were specifically on the agenda. These lists cover EPA headquarters offices (EPA Regional office information will follow shortly). We have also attached copies of participant lists for the listed EPA sponsored or co-sponsored meetings, lists of participants for the listed meetings at which EPA participated (where available), and presentation materials (hand outs and/or overheads) where available.

Question. For any program sponsored or co-sponsored by EPA, how were/are decisions made about the participants in the program? Who is responsible for making these decisions? How does EPA assure that the views reflected are balanced?

Answer. It is EPA’s policy to be as inclusive as possible in determining who should participate (speak/present/exhibit) in EPA-sponsored public events, in order to ensure that all constituencies and all sides of the issue are represented. For the

public meetings listed in our response to question #16, the EPA staff responsible for each meeting worked with other co-sponsors and stakeholders to identify qualified representatives from all appropriate sectors, including: industry; environmental groups; federal, state, and local government; and academia. Attendance at EPA-sponsored public meetings is open to all that are interested and the events are advertised through EPA mailings and in such media as the trade press, public press, and the Internet.

Question. Does EPA have plans for any more of these meetings? If so, please provide a current list of these as well as any updates?

Answer. Please see Attachment 2, which is a list of EPA-sponsored public meetings related to the global climate issue that are planned for the remainder of fiscal year 1999.

Question. Has EPA been involved in any activities involving consulting with countries implementing the Kyoto Protocol since the fiscal year 1999 VA HUD Appropriations was signed by the President on October 21, 1998? Have you been involved with Argentina? If so, what was the scope of the activity and who was involved? Please provide any documents related to this activity including trips taken and the names of participants?

Answer. EPA has supported climate change activities in developing countries since the negotiations leading up to the signing of the UN Framework Convention for Climate Change in 1992. As one of the key agencies supporting the U.S. Country Studies Program, an interagency program, EPA has supported cooperative work with numerous developing countries in the areas of inventories, mitigation, vulnerability and adaptation, and capacity building. EPA is now focusing its efforts on supporting capacity in inventories, economic analysis and modeling, technology cooperation, and linkages between climate mitigation and local pollution. This work is being concentrated in a few key developing countries including Argentina, Brazil, Chile, China, Korea and Mexico. In Argentina EPA participated in several interagency trips (with Departments of State, Agriculture, Energy and Transportation) to discuss technical support concerning climate change to the Argentine Department of Natural Resources and Sustainable Development. This support focuses on the following technical areas: determine the baseline for GHG emissions; perform GHG inventory for 1997; revise the 1990 and 1994 GHG emission inventories; determine future emission projections; establish different mitigation scenarios and analyze their impacts, and costs/benefits; elaborate alternative proposals for GHG emission goals under the FCCC; and prepare a Second National Communication or a Revision of the Initial National Communication. EPA participants in these technical trips were Maurice N. LeFranc, Jr., Clare Breidenich, Leianne Clements and Peter Nagelhout.

Question. Has EPA provided any funds to state or local entities to begin the process of implementing the Administration's proposed climate policy, including the Kyoto Protocol? Provide the details of all grants to state and local organizations including the date of the grant, the funding level, agreed scope, principal contact and Requests for Proposals for the following periods:

- (a) July 25, 1997 through July 23, 1998
- (b) July 24, 1998 through October 21, 1998
- (c) October 21, 1998 through April 28, 1999

Answer. EPA has supported climate change activities in developing countries since the negotiations leading up to the signing of the UN Framework Convention for Climate Change in 1992. As one of the key agencies supporting the U.S. Country Studies Program, an interagency program, EPA has supported cooperative work with numerous developing countries in the areas of inventories, mitigation, vulnerability and adaptation, and capacity building. EPA is now focusing its efforts on supporting capacity in inventories, economic analysis and modeling, technology cooperation, and linkages between climate mitigation and local pollution. This work is being concentrated in a few key developing countries including Argentina, Brazil, Chile, China, Korea, and Mexico. In Argentina, EPA participated in several interagency trips (with the Departments of State, Agriculture, Energy, and Transportation) to discuss technical support concerning climate change to the Argentine Department of Natural Resources and Sustainable Development. This support focuses on the following technical areas: determine the baseline for GHG emissions; perform GHG inventory for 1997; revise the 1990 and 1994 GHG emission inventories; determine future emission projections; establish different mitigation scenarios and analyze their impacts and costs/benefits; elaborate alternative proposals for GHG emission goals under the FCCC; and prepare a Second National Communication or a Revision of the Initial National Communication. EPA participants in these technical trips were Maurice N. LeFranc, Jr., Clare Breidenich, Leinne Clements and Peter Nagelhout.

Question. Has EPA provided any funding for studies of either domestic or international carbon emissions trading?

If so, please provide by May 15, 1999:

- (a) the names of the organizations or individuals receiving the grant;
- (b) the amount of the grant;
- (c) the documents describing the initial scope of the project;
- (d) the dates of initial contact and project initiation; and
- (e) copies of these reports or preliminary drafts

Also, please provide the Agency's statutory basis for pursuing these studies.

Answer. EPA provided funding for the following studies that deal with domestic and/or international carbon emissions trading:

(a) grant recipients:

(21) H. John Heinz III Center for Science, Economics and the Environment, Washington DC.

(22) Center for Clean Air Policy, Washington DC.

III. Resources for the Future, Washington DC.

(b) funding level and (d) project period

I. John H. Heinz III Center for Science, Economics and the Environment.

Fiscal year 1999/2000—Not funded.

Fiscal year 1998/1999—Funding Level: \$100,000; Project Period: September 23, 1996–September 23, 1998.

Fiscal year 1997/1998—Funding Level: \$100,000; Project Period: September 23, 1996–September 23, 1998.

II. Center for Clean Air Policy.

Fiscal year 1999/2000—Funding Level: \$160,000; Project Period: August 1, 1999–July 31, 2000.

Fiscal year 1998/1999—Funding Level: \$196,000; Project Period: August 1, 1998–July 31, 1999.

Fiscal year 1997/1998—Funding Level: \$50,000; Project Period: July 1997–December 1997.

III. Resources for the Future

Fiscal year 1999/2000—N/A.

Fiscal year 1998/1999—Funding Level: \$220,000; Project Period: July 1, 1997–June 30, 2000.

Fiscal year 1997/1998—Funding Level: \$75,000; Project Period: July 1, 1997–June 30, 2000.

(c) and (e) Please see attached.

ATTACHMENT 1

The following two lists summarize: 1) public meetings related to the global climate issue that have been sponsored or co-sponsored by EPA; and 2) public meetings related to the global climate issue at which EPA staff have participated as presenters and/or exhibitors. These lists include public meetings that occurred in fiscal year 1999 (10/1/98 until 3/18/99, the date of your request).

EPA SPONSORED AND CO-SPONSORED PUBLIC MEETINGS

Meeting: Is Climate Changing Where the Wild Things Are?

Date/location: October 7–8, 1998, Washington, D.C.

Participant: David Gardiner, Assistant Administrator, Office of Policy

Meeting: Third Annual State and Local Climate Change Partners' Conference

Date/location: October 13–15, 1998, Albuquerque, NM

Participant:

Katherine Sibold, staff

Jane Leggett Emil, Director, Climate Policy and Programs Division

Steve Thompson, staff, EPA Region 6

Ronn Dexter, Director, Climate Outreach and Innovations Division

Jerry Clifford, Deputy Regional Administrator, Region 6

Jack Colbourn, staff, Region 9

Clay Ogg, staff

Shari Friedman, staff

Meeting: Air & Waste Management

Association: Second International Specialty Conference on Global Climate Change

Date/location: 10/14/98, Crystal City, VA

Participant: David Doniger, Counsel to the Assistant Administrator, Office of Air and Radiation

Meeting: Earth Technologies Forum

Date/location: 10/26–28/98, Washington, D.C.
 Participant:
 Peter Robertson, Deputy Administrator
 Bob Perciasepe, Assistant Administrator, Office of Air and Radiation
 David Doniger, Counsel to the Assistant Administrator, Office of Air and Radiation
 Meeting: The Importance of Air Traffic Management Modernization Action Plan to Climate Protection
 Date/location: 10/7–10/98, Brussels, Belgium.
 Participant: Stephen O. Andersen, Ph.D., staff
 Meeting: Semiconductor Manufacturing Energy Efficiency Workshop
 Date/location: 10/22/98, Austin, TX.
 Participant: Jeanne Briskin, staff
 Meeting: Global Climate Change: Science, Policy, and Mitigation/Adaptation Strategies
 Date/location: 10/13–15/98, Washington, D.C.
 Participant: Reid Harvey, Jennifer Macedonia, staff
 Meeting: Electric Utilities Environment Conference on Science, Regulations & Impacts of SO₂, CO₂, O₃, NO_x & Mercury/EEI
 Date/location: 1/11/99, Tucson, AZ.
 Participant:
 Skip Laitner, Jennifer Macedonia, staff
 Brian McLean, Director, Acid Rain Division

CONFERENCES AT WHICH EPA STAFF HAVE PARTICIPATED AS SPEAKERS AND/OR EXHIBITORS

Meeting: The Nature Conservancy Seminar
 Date/location: October 1, 1998, Edgartown, MA
 Participant: Jim Titus, staff
 Meeting: Rutgers University Seminar
 Date/location: October 2, 1998, New Brunswick, NJ
 Participant: Jim Titus, staff
 Meeting: CoastFest 1998
 Date/location: October 3, 1998, Brunswick, GA
 Participant: Exhibit only
 Meeting: Delaware Coast Day
 Date/location: October 4, 1998 (Lewes, DE)
 Participant: Jim Titus, staff
 Meeting: Ocean Community Conference
 Date/location: November 16–19, 1998, Baltimore, MD
 Participant: Jim Titus, staff
 Meeting: The Changing Face of Public Health
 Date/location: January 21–22, 1999, Raleigh, NC
 Participant: Exhibit only
 Meeting: BioEnergy Meeting
 Date/location: October 1998, Madison, WI
 Participant: Exhibit only
 Meeting: Town Hall Meeting
 Date/location: Overland Park, Kansas, October 1998
 Participant: Katherine Sibold, staff
 Meeting: Fish Expo
 Date/location: November 15–17, 1998, Seattle, WA
 Participant: Exhibit Only
 Meeting: RCRA National Meeting
 Date/location: January 1999, Washington, D.C.
 Participant: Henry Ferland, Ethan McMahon, staff
 Meeting: R 99 Recovery, Recycling, Re-integration Congress
 Date/location: February, 1999, Geneva, Switzerland
 Participant: Eugene Lee, staff
 Meeting: New Jersey Dept. of Env. Protection GHG Workgroup Meeting
 Date/location: April 1999, Trenton, NJ
 Participant: Eugene Lee, staff

Meeting: Resources for the Future Workshop on Emissions Trading Systems for Greenhouse Gas Emissions

Date/location: January 15, 1999, Washington, D.C.

Participant:

Robert Shackleton, Martin Ross, staff

Michael Shelby, Director, Energy & Transportation Sectors Division

Meeting: CCAP's "Greenhouse Gas Emissions Trading Dialogue Group"

Date/location: Quarterly meetings, Washington, D.C.

Participants:

Stuart Schare, Tracy Terry, John Thomas

Michael Shelby, Director, Energy & Transportation Sectors Division

Meeting: Clean Energy Working Group

Date/location: 12/10/98, Washington, D.C.

Participant: Robert Perciasepe, Assistant Administrator, Office of Air & Radiation

Meeting: Edison Electric Institute Air Quality Integration Dialogue

Date/location: 12/18/98, Washington, D.C.

Participant: Robert Perciasepe, Assistant Administrator, Office of Air & Radiation

Meeting: Federal Bar Association

Date/location: 1/27/99, Washington, D.C.

Participant: David Doniger, Counsel to the Assistant Administrator, Office of Air & Radiation

Meeting: National Association of State Energy Officials

Date/location: 2/19/99, Washington, D.C.

Participant: Robert Perciasepe, Assistant Administrator, Office of Air & Radiation

Meeting: Alliance to Save Energy: Talking Points to Save Energy

Date/location: 3/8/99, Washington, D.C.

Participant: Robert Perciasepe, Assistant Administrator, Office of Air & Radiation

Meeting: Ohio Farm Bureau

Date/location: 3/10/99, Washington, D.C.

Participant: Robert Perciasepe, Assistant Administrator, Office of Air & Radiation

Meeting: Global Climate Forum

Date/location: 1/28/99, Cambridge, MA

Participant: Reid Harvey, staff

Meeting: Energy Conservation Subcommittee of the National Association of Regulatory Utility Commissioners (NARUC)

Date/location: 11/8/98, Washington, D.C.

Participant: Skip Laitner, staff

Meeting: Energy/Environment Seminar, Johns Hopkins Paul H. Nitze School of Advanced International Studies (SAIS)

Date/location: 12/7/98, Washington, D.C.

Participant: Skip Laitner, staff

Meeting: Edison Electric Institute.

Date/location: 1/20/99, Washington, D.C.

Participant: Skip Laitner, Sam Napolitano, staff

Meeting: U.S. Advanced Ceramics Association Meeting

Date/location: 3/9/99, Washington, D.C.

Participant: Skip Laitner, staff

Meeting: Eastern Economics Association

Date/location: 3/12/99, Washington, D.C.

Participant: Skip Laitner, staff

Meeting: Emissions Trading: Extracting Revenue Opportunities for Your Company in an Emerging Commodity Market

Date/location: 12/7–8/98, Washington, D.C.

Participant:

Brian McLean, Director, Acid Rain Division

Jennifer Macedonia, staff

Meeting: Emissions Trading and Permit Allocation Conference

Date/location: 10/14–15/98, London, England

Participant: Brian McLean, Director, Acid Rain Division

Meeting: Briefing for Congressional staff with a focus on Acid Rain's experience with early action incentives

Date/location: 2/5/99, Washington, D.C.

Participant: Brian McLean, Director, Acid Rain Division

ATTACHMENT 2

The following two lists summarize: (1) public meetings related to the global climate issue that will be sponsored or co-sponsored by EPA; and (2) public meetings related to the global climate issue at which EPA staff will participate as presenters and/or exhibitors. These lists include public meetings that will occur for the remainder fiscal year 1999 (3/18/99, the date of your request, until 9/30/99).

UPCOMING EPA SPONSORED AND CO-SPONSORED PUBLIC MEETINGS

Meeting: Climate Change: What Does It Mean for the Midwest?
 Date/location: April 28, 1999, Kansas City, MO
 Participant:
 Dennis Grams, Regional Administrator, Region 7
 David Gardiner, Assistant Administrator, Office of Policy
 Meeting: Regional Conference on Potential Climate Change Issues in Florida's Coastal Communities
 Date/location: May 26, 1999, Miami, Florida
 Participant:
 Jim Titus, staff (tentative)
 David Gardiner, Assistant Administrator, Office of Policy (tentative)
 Meeting: Technical Workshop on Sea Level Rise, Coral Bleaching, and other Potential Global Warming Impacts in Florida Keys
 Date/location: May 27, 1999, Marathon, Florida
 Participant: Jim Titus, staff (tentative)
 Meeting: The Second International Symposium on Greenhouse Gases
 Date/location: 9/8/99, Netherlands
 Participant: Reid Harvey, staff

CONFERENCES AT WHICH EPA STAFF WILL PARTICIPATE AS SPEAKERS AND/OR EXHIBITORS

Meeting: Risk and Insurance Management Society Annual Conference
 Date/location: April 11–16, 1999, Dallas, Texas
 Participant: Exhibit only
 Meeting: Electric Power 1999
 Date/location: April 20–22, Baltimore, Maryland
 Participant: Exhibit only
 Meeting: National Town Meeting
 Date/location: May 2–5, 1999, Detroit, Michigan
 Participant: David Gardiner, Assistant Administrator, Office of Policy
 Meeting: Public Risk Management Association Convention and Expo
 Date/location: June 6–9, 1999, San Diego, California
 Participant: Exhibit only
 Meeting: Edison Electric Institute Annual Convention and Exposition
 Date/location: June 13–15, Long Beach, California
 Participant: Exhibit only
 Meeting: National Association of Mutual Insurance Companies
 Date/location: September 19–22, San Antonio, Texas
 Participant: Exhibit only
 Meeting: Coastal Issues Conference
 Date/location: April 19–20, 1999, South Padre Island, Texas
 Participant: Jim Titus, staff (tentative) and Exhibit
 Meeting: Coastal Zone 1999 Conference
 Date/location: July 27–29, 1999, San Diego, California
 Participant: Jim Titus, staff (tentative) and Exhibit
 Meeting: Maryland Coast Day
 Date/location: September 18, 1999, Assateague Island, MD
 Participant: Jim Titus, staff (tentative) and Exhibit
 Meeting: CoastFest 1999
 Date/location: September 25, 1999, Brunswick, GA
 Participant: Jim Titus, staff (tentative) and Exhibit
 Meeting: National Environmental Health Association Annual Educational Conference and Exhibition
 Date/location: July 1, 1999, Nashville, TN
 Participant: Exhibit only

Meeting: National Association of County & City Health Officials Annual Conference

Date/location: July 14–17, 1999, Dearborn, Michigan

Participant: Exhibit only

Meeting: American Meteorological Society Broadcasters Meeting

Date/location: June 18–25, 1999, Orlando, FL

Participant: John Foster, Karen Gibbons, staff, and Exhibit

Meeting: Radio and Television News Directors Association 1999

Date/location: September 29–October 2, 1999, Charlotte, North Carolina

Participant: Exhibit only

Meeting: U.S. Conference of Mayors Annual Conference

Date/location: June 11–15, 1999, New Orleans, LA

Participant: Exhibit only

Meeting: National Conference State Legislatures Annual Meeting

Date/location: June 24–28, 1999, Indianapolis, IN

Participant: Exhibit only

Meeting: National Association of Counties Annual Conference

Date/location: July 16–20, 1999, St. Louis, MO

Participant: Exhibit only

Meeting: National Association of State Energy Officials Annual Meetings

Date/location: September 19–20, 1999, Indianapolis, IN

Participant: Exhibit only

Meeting: International City/County Management Association Annual Conference

Date/location: September 26–29, Portland, Oregon

Participant: Exhibit only

Meeting: Izaak Walton League Annual Conference

Date/location: July 1, 1999, Williamsburg, VA

Participant: Karen Gibbons, staff, and Exhibit

Meeting: Federation of Fly Fishers Annual Conference

Date/location: August 1, 1999, Gatlinburg, TN

Participant: Karen Gibbons, staff, and Exhibit

Meeting: California Resource Recovery Conference

Date/location: June, 1999, Monterrey, CA

Participant: Exhibit only

Meeting: OECD Workshop on Extended Producer Responsibility and Waste Minimization Policy

Date/location: May 1999, Paris, France

Participant: EPA speaker to be determined

Meeting: National Recycling Coalition Annual Congress

Date/location: September 1999, Cincinnati, OH

Participant: EPA speaker to be determined

Meeting: Recycling Council of Alberta, “Frontiers in Waste Reduction”

Date/location: September 1999

Participant: EPA speaker to be determined

EPA’s primary source of statutory authority for funding studies that deal with domestic and/or international carbon emissions trading is section 103(a) and (b) of the Clean Air Act. Section 103 of the Clean Air Act requires the Administrator to establish a “national research and development program for the prevention and control of air pollution.” As part of this program, section 103(a)(1) requires the Administrator to, “conduct, and promote the coordination and acceleration of, research, investigations, experiments, demonstrations, surveys, and studies relating to the causes, effects (including health and welfare effects), extent, prevention and control of air pollution.” Section 103(b) provides that in carrying out subsection (a), the Administrator is authorized to “collect and make available, through publications and other appropriate means, the results of and other information, including appropriate recommendations by him in connection therewith, pertaining to such research and other activities.” Section 103(g) of the CAA provides additional authority for some of the Agency’s funding of studies that deal with domestic and/or international carbon emissions trading. Section 103(g) provides that in carrying out subsection (a), “the Administrator shall conduct a basic engineering research and technology program to develop, evaluate, and demonstrate nonregulatory strategies and technologies for air pollution prevention.” The program is to include among its elements, “[i]mprovements in nonregulatory strategies and technologies for preventing or reducing multiple air pollutants, including sulfur oxides, nitrogen oxides, heavy met-

als, PM-10 (particulate matter), carbon monoxide, and carbon dioxide, from stationary sources, including fossil fuel power plants. Such strategies and technologies shall include improvements in the relative cost effectiveness and long-range implications of various air pollutant reduction and nonregulatory control strategies such as energy conservation, including end-use efficiency, and fuel-switching to cleaner fuels.”

Other statutes provide additional authority for EPA’s activities in this area. Such statutes include: National Environmental Policy Act of 1969, 42 U.S.C. 4321 et seq. and the Global Climate Protection Act of 1987, 15 U.S.C. 2901.

CLIMATE CHANGE: MEETING IN KANSAS CITY, MO

Question. April 28, 1999 Meeting in Kansas City, Missouri. Who selected the speakers for the Kansas City event? Who defined the “balance” in terms of participants. Please provide a description of the credentials of the speakers, whether they receive government funding, and, if funding has been received, which agency has provided the funding and for what.

Answer. EPA sought advice and input from a variety of sources outside the Agency at every stage of the planning and production of the event in order to strive for balance. In the very beginning stages of planning, we asked 40 organizations and governmental bodies to cosponsor the conference. At various times, we asked for their help in identifying, contacting, and arranging for speakers and other cosponsors. We later asked all of our initial contacts to help with suggested lists of participant invitees and publicity, whether or not they had chosen to cosponsor the event. For example, a Missouri-based non-profit organization, Bridging the Gap, cosponsored the Kansas City conference and provided us with a mailing list of approximately 900 business and governmental addresses to which we sent invitations. The Missouri Chamber of Commerce asked for and received flyers to do a special mailing. The Missouri Farm Bureau did their own mailing on the meeting as well.

The biographies of the speakers for the conference are attached. Six of the speakers are employed by the federal government: Dennis Grams, Regional Administrator of USEPA, Region 7; David Gardiner, Assistant Administrator, Office of Policy, USEPA; Glen Overton, Regional Administrator for the General Service’s Administration’s Heartland Region; Dr. David Easterling, Principal Scientist at the National Climatic Data Center; Joseph Aldy, Senior Adviser at the President’s Council of Economic Advisers; and Val Jensen, Director of the Chicago Regional Office of the Department of Energy. As far as we know, the only ones who work for non-federal organizations that have received government funding are the ones to whom the Office of Economy and Environment (OEE) in EPA have provided money. They are the following:

Anita Randolph and Steve Mahfood both work for the Missouri Department of Natural Resources (DNR). The Missouri DNR received money from EPA/OEE in 1991 to conduct a statewide energy survey, in 1994 to do an inventory of greenhouse gases, and in 1995 to produce a state action plan to evaluate mitigation options.

George Moody works for the City of Overland Park, Kansas. From 1993 to present, the International Council for Local Environmental Issues (ICLEI) has received funding from EPA/OEE to support the “Cities for Climate Protection Program”. Overland Park has been a participant in the program and receives technical support from ICLEI, but no direct funds from OEE.

Question. Which speaker will document the uncertainty in the science?

Answer. The April 28 conference in Kansas City addressed uncertainties in the science of climate change in a number of ways. Eugene S. Takle, Ph.D., professor of atmospheric science at Iowa State University, gave a talk entitled, “What is Global Warming and How Do We Know It’s Happening?” In his speech he repeatedly referenced the uncertainties involved in long-range projections of any scientific phenomenon, including the statistical ranges of validity in the scientific data he presented regarding observed and projected trends in climate change. David R. Easterling, Ph.D., principal scientist at the National Climatic Data Center (NCDC), spoke on “Droughts, Floods, and Other Weather-related Impacts on the Midwest.” He reported data that had been documented by scientists at NCDC as well as projections that the center’s scientists are making about possible future events that may occur in the Midwest, should climate trends continue. He, too, acknowledged some of the uncertainties inherent in such projections and some of the controversy surrounding the scientific debate. Participants in the audience were given the opportunity to ask both Dr. Takle and Dr. Easterling questions about their research; many opinions varying from those of the two scientists were presented by audience members.

Question. Which participant will discuss the inadequacy of the models to predict local effects?

Answer. Eugene Takle noted that global climate models have poor resolution at the regional and local level, although he demonstrated that the models do a good job at replicating observed trends in climate on a global scale.

Question. Which speaker will give the non-governmental assessment of the international negotiations?

Answer. The Missouri Coalition on Global Climate Change provided a speaker, Christopher C. Horner, Esq., member and liaison of the Cooler Heads Coalition, to give a non-governmental assessment of the international negotiations regarding climate change.

Question. Which participant will give the economic assessment in contrast to the Administration's discredited analysis?

Answer. Christopher Horner included remarks in his speech about economic assessments that had been performed outside the government that differed from assessments produced by economists within the federal government. David Martin, director of governmental affairs at Kansas City Power and Light, made mention of the differing economic reports during his speech. In addition, several participants from the audience questioned the government economist, Joseph Aldy from the Council of Economic Advisers, about differing analyses and assessments after his speech. Many question/answer periods were provided throughout the day in order to assure a forum for open, balanced discussion of the issues.

Question. Which participant will discuss the impacts on small business from the viewpoint of economic harm?

Answer. Several of the speakers talked about the potential economic harm to small businesses from the impacts of climate change. In particular, James W. Russell, Ed.D., vice president for outreach at the Institute for Business and Home Safety, talked about the money lost by businesses because of recent severe weather events. Several climate models indicate an increase in precipitation intensity, suggesting a possibility for more extreme rainfall events due to climate change.

In addition, David Martin of Kansas City Power and Light discussed the potential economic impact of the Kyoto Protocol on electric utilities and ratepayers, noting that climate change is one of the leading issues facing utilities today. Christopher Horner discussed the potential negative economic impacts of the Kyoto Protocol on jobs, Gross Domestic Product, and international competitiveness.

Question. How and when was notice of this event provided to interested parties? If a distribution (mail, electronic mail, or facsimile) was made of any notice, please provide this list.

Answer. In total, more than 5,000 invitations were sent to diverse lists of potential participants. We placed announcements on at least two Internet mailing lists and the U.S. EPA Kansas City-based Region 7 web page. We put a notice on the Region 7 "Headliners" page, which provides regulatory announcements to the public. Notices were placed in bulletins of various public and private organizations in Iowa and Missouri. We issued press releases and a press advisory from Region 7. We did a mailing to press contacts of the 100 largest newspapers and electronic media organizations in Region 7. We provided press packets in advance to those who requested them (Kansas City Star, Wichita Eagle Beacon, etc.) We worked with each state Energy Office in the Region (Kansas, Missouri, Iowa and Nebraska) to get them to alert their clients about the meeting. And in planning of the meeting we talked with the state Energy Offices, business organizations, energy organizations, a number of university personnel, and others. All of this was done in an effort to assure that the cosponsors, speakers, and participants represented a balance of backgrounds and viewpoints on the issue of climate change.

Though many of our co-sponsors and other interested parties asked for information about the conference throughout the months of January and February 1999, and received phone calls, emails and faxes in reply, all formal notices were sent during the months of March and April, 1999, including postal and electronic mailings using "distribution lists". The lists we used are attached.

In addition to the mailings we did, were mailings sent out by various groups who preferred sending their own notices along with or instead of the flyers we produced. Those provided flyers by us were: Heartland Solar Energy Industries Association, 100; Bridging the Gap, 500; Metropolitan Energy Center, 100; Missouri Department of Natural Resources, 50; Mid America Regional Council, 50; Department of Energy, Denver Regional Support Office, 50; Department of Energy, Kansas City Plant, 100; Competitive Resources Incorporated, 50; General Services Administration, 50; and Missouri Coalition for Global Climate Change, 200.

Question. When was this event initially planned? Who were the participants in the planning?

Answer. Planning for this conference began in March 1998. As stated above, a committee of EPA staff at Washington Headquarters and at EPA's Region 7 Office in Kansas City approached approximately 40 organizations to help in cosponsoring the event, identifying speakers, and inviting participants. One of these organizations, Bridging the Gap, participated in several conference calls in the later stages of planning (January through March 1999) to set up some of the logistics.

Question. What other events are planned for the balance of this fiscal year? Please provide the dates, preliminary agendas, and planned speakers.

Answer. There is just one other such climate change event planned for the rest of this fiscal year. The title of that conference will be "Climate Change: What Does It Mean for South Florida?" It will be held May 26 and 27, 1999, in Miami and in the Keys. Each venue will host a half-day event to provide information about the potential impacts of climate change on South Florida's economy, infrastructure, and natural resources. Strategies and sustainable solutions for reducing the potential risks associated with global warming and sea level rise will also be addressed. Confirmed speakers include: Dr. Stephen P. Leatherman, director of the International Hurricane Center at Florida International University; L. Benjamin Starrett, a fellow at the Growth Partnership, Collins Center for Public Policy; Dr. Pamela Hallock, professor of marine science, University of South Florida; and Dr. Harold C. Wanless of the Department of Geological Sciences at University of Miami.

Question. What Members of Congress have been invited to this program? What Congressional staff have been invited to this program? When were they invited?

Answer. Congresswoman Jo Ann Emerson and Congressman McCarthy Benson were both invited to the climate change conference in Kansas City held April 28. The invitations that were sent to Representatives Emerson and Benson were intended to include the entire staff of their offices, as were all the conference invitations we sent to government, nonprofit and private business offices. Both Members of Congress were sent invitations in our initial mailing to invitees about March 20, 1999, and in a subsequent "reminder" mailing about April 10, 1999.

CLIMATE CHANGE: GREENHOUSE GAS EMISSIONS CREDIT FOR EARLY ACTION

Question. On April 15, 1998, EPA entered into a proposed consent decree with the Natural Resources Defense Council (NRDC) that included an agreement to study how CO₂ emissions would be controlled. This step appears to be an effort towards implementation of the Kyoto Protocol. Why did EPA entertain the possibility of regulating CO₂ when the original October 1994 consent agreement with NRDC made no mention of CO₂? Did EPA decide to take this step after it realized that it had no authority to proceed to regulate CO₂ based on an April 10, 1998 General Counsel memo on this subject to the Administrator?

Answer. The settlement agreement that you refer to calls for a multiple pollutant analysis that looks at the relationship among the four most significant air pollutants from electric power generation: NO_x, SO₂, CO₂, and mercury. In agreeing to undertake that analysis, EPA proposed simply to update a series of multi-pollutant analyses of utility emissions that were first undertaken more than two years ago. The updated analysis called for in the proposed agreement was specifically intended to inform a decision that EPA must make under the Clean Air Act on whether to regulate mercury emissions from electric power plants.

Multiple pollutant analysis of utility emissions makes sense because pollution control strategies to reduce emissions of these pollutants are highly inter-related. Strategies to reduce emissions of any one pollutant from power generation can have effects of differing magnitude on emissions of the other pollutants. The cost and other impacts of control strategies for these pollutants are also highly interdependent. Multiple pollutant analyses examine these inter-relationships and can provide valuable information to the electric power industry, the public, Federal agencies, and Congress about the relationships among policy choices to address the major pollutants from this industry.

The options that were examined in the study are hypothetical approaches to emission controls on the electric power industry for each pollutant and do not represent the EPA or Administration position on how any of these pollutants should be reduced in the future. Specifically with regard to carbon dioxide, the Administration has committed not to implement the Kyoto Protocol without the advice and consent of the Senate.

Although the Agency has legal authority to regulate CO₂ as an air pollutant under provisions of the Clean Air Act if the Administrator makes certain determinations (see Memorandum of Jonathan Cannon, General Counsel, April 10, 1998), the Administrator has not made any such determinations.

Question. Has EPA factored into its budget and programs the 1998 recommendations of the National Research Council regarding science priorities? If so, please provide the document that describes the issues raised by the National Research Council and the detailed plan to respond to these issues. If not, please provide this analysis by March 15, including the funding requirements.

Answer. Yes. EPA, along with the entire US Global Change Research Program (USGCRP) incorporated the recommendations of the National Research Council (NRC) into the development of its programs. This consideration is reflected in the fiscal year 2000 USGCRP Our Changing Planet annual report to Congress and the USGCRP's fiscal year 2000 Implementation Plan. (A draft of this report has already been delivered to Congress by the USGCRP.) It is also reflected in EPA's new Research Strategy for the Global Change Research Program, which is still being drafted and will soon go through a rigorous, external peer review.

One example of how EPA responded to the recommendations of the NRC is its new support for Human Dimensions research as part of its assessment program. The NRC identified a wide range of Human Dimensions research questions that should be considered by the USGCRP. EPA is coordinating with other federal agencies to address many of these questions. EPA is working with other federal agencies to ensure that efforts are not duplicated and that each agency focuses on specific human dimensions questions related to its own program and niche within the USGCRP.

Humans have many different impacts on natural systems, including changes in land use, industrial processes, agricultural and forest management practices, and emissions of air and water pollutants. Humans also respond to the effects of global change. Human dimensions research entails understanding how humans, who are an integral component of the Earth system, contribute and respond to global change. Research on the environmental effects of human activities is critical for understanding long-term global change. The NRC's report reaffirmed the need to articulate how the science of global change is important to people and society. The new assessment-oriented EPA Global Change Research Program incorporates considerations of "human dimensions" into both its assessment activities and its foundation research program. In the assessment program, this will occur in two ways: (1) through ongoing engagement of stakeholders to define the specific measures of change that are of interest; and (2) through coordination of findings from the social sciences with those from the physical and biological sciences to attain a policy-relevant perspective. In the foundation research program, the near-term priorities for human dimensions research that are relevant to EPA's Global Program include understanding how humans, who are an integral component of the Earth system, contribute and respond to global change.

Question. The October 16, 1998 issue of Science carried the story about the possibility that North America appears to be a massive sink for carbon. The article "A Large Terrestrial Carbon Sink in North America implied by Atmospheric and Oceanic Carbon Dioxide Data and Models" presents evidence that North America (US+Canada) sops up enough carbon each year "to cover every ton of carbon discharged annually by fossil fuel burning in the United States and Canada." The recommendations for further study included:

- Intensive atmospheric sampling and ecological field studies to identify the location and cause of North American terrestrial CO₂ uptake,
- New atmospheric measurements to include Eurasia, South America, Africa, and Australia,
- Studies to better characterize oceanic CO₂ uptake, particularly in the Southern Hemisphere, and
- Reduced uncertainty in atmospheric transport modeling.

Has EPA developed a program to address these issues? If so, what funds are budgeted?

Has EPA had any discussions with Canadian authorities to address CO₂ monitoring as a joint scientific effort? If so, what are the plans?

Answer. EPA is no longer conducting any research related to the carbon cycle (which includes analysis of carbon sinks). This is an area of disinvestment for EPA's Global Program, given its redirection towards a more assessment-oriented program with primary emphasis on understanding the potential consequences of global change for human health, ecosystems, and socioeconomic systems in the United States. EPA is no longer doing carbon cycle work. Within the context of the entire USGCRP, other federal agencies now have responsibility for the carbon cycle work.

ISSUES IN THE 1998 NAS/NATIONAL RESEARCH COUNCIL ANALYSIS OF SCIENCE
UNCERTAINTIES AND THE OCTOBER 1998 HANSEN NAS PAPER

Question. In October 1998 Jim Hansen published a paper in the Proceedings of the National Academy of Sciences entitled "Climate Forcings in the Industrial Era". Key conclusions included:

- The forcings that drive long-term climate change are not known with an accuracy sufficient to define future climate change.
- Quantitative knowledge of all significant climate forcings is needed to establish the contribution of deterministic factors in observed climate change and to predict future climate.

The paper identified a number of important areas for further research that should be addressed in the fiscal year 2000 budget:

Aerosols.—advanced capability for global satellite measurement of aerosol scattering and absorption properties.

Aerosols-clouds.—coordinated research program including accurate global measurement of aerosol and cloud changes, as well as *in situ* field studies and aerosol modeling.

Land-use.—comprehensive historical data on land-use change and increased realism of land processes in climate models.

Solar variability.—need to monitor and understand.

Has EPA reviewed this paper as input to its research funding request? If so, please provide the detailed analysis of the issues and the original EPA budget request (not the President's budget request)? If not, please provide this analysis by April 30, 1999.

Answer. EPA has not reviewed this paper as input to its research funding request because all of the uncertainties identified by Hansen in his paper relate to the development of global circulation models that predict future climatic conditions. EPA no longer is involved in the development of climate models. This is an area of disinvestment for EPA's Global Program, given its redirection towards a more assessment-oriented program with primary emphasis on understanding the potential consequences of global change for human health, ecosystems, and socioeconomic systems in the United States. EPA is no longer doing climate modeling (in the same way that it is no longer doing carbon cycle work). Within the context of the entire USGCRP, other federal agencies now have responsibility for the carbon cycle work.

It is important to note that EPA coordinates closely with all other federal agencies in the U.S. Global Change Research Program (USGCRP) and benefits from the work being done by the agencies developing climate models. EPA is part of the larger USGCRP and is involved in the development of the USGCRP's fiscal year 2000 implementation plan and the USGCRP's Our Changing Planet annual report to Congress. Through this process, EPA coordinates its activities with those of other federal activities. Opportunities to cooperate with other federal agencies are also identified.

Question. In 1999, Tim Barnett, Scripps Institution of Oceanography, ran 11 models and concluded: "There is no model that consistently agrees well with the observations." Is EPA using any models to predict the effects of global climate change on a regional or local level? If so, what models are being used?

Answer. EPA's assessments do not make predictions of the effects of future climate change on a regional or local level. EPA uses input from climate models to define scenarios of potential climate futures. That is, the scenarios are used to understand the sensitivity and vulnerability of human and ecological systems to potential future climate change, but not to make actual predictions of future conditions. All of the regional assessments being sponsored by the EPA as part of the National Assessment effort use state-of-the-art climate scenarios generated by the Canadian and British climate modelers. In some cases, these model outputs are used as input to Regional Climate Models in order to develop scenarios for future climatic conditions at a regional level. Also, EPA—and the regional coordinators it is sponsoring in the research community—are using the VEMAP model output to understand the potential changes in vegetation that may occur as the climate changes.

EPA has conducted one study that assigns probabilities to particular future effects of climate change: The Probability of Sea Level Rise, which was published in October 1995. This study, conducted by the Office of Policy, Planning, and Evaluation, developed probability-based projections that can be added to local tide-gauge trends to estimate future sea level rise at particular locations around the coast of the United States.

Question. Since, according to the Hansen paper, as well as others, models are not capable of predicting natural variability and global effects, how can EPA justify

using these models to predict effects on a smaller, “microscopic scale” as planned for the 3 regional assessments (Mid-Atlantic, Great Lakes, & Gulf Coast)?

Answer. EPA’s assessments of the potential consequences of climate change and variability on the United States rely on a diversity of information. Some of the EPA assessment work uses input from climate models to define scenarios of potential climate futures. For example, all of the regional assessments being sponsored by the EPA as part of the National Assessment effort use state-of-the-art climate scenarios (specifically ones that are generated by the Canadian and British climate modelers). It must be emphasized that the climate model output is viewed as scenarios, not predictions of future climate. They are being used to understand the sensitivity and vulnerability of human and ecological systems to potential future climate change, but not to make actual predictions of future conditions.

It is also important to understand that the regional assessments are not limited to scenarios generated by climate models. The assessments also use other information to illustrate the potential consequences of climate variability and change for human health and ecological systems. In addition to climate model output, EPA’s assessment work also relies on historic data to understand the sensitivity of human and ecological systems to change (e.g., changes in the profile of the Blackwater National Wildlife Refuge as sea level has risen during the past 50 years). Also, plausible “what if” scenarios are used to illuminate the sensitivity of various systems. These sensitivity analyses help to define the potential risks and opportunities posed by climate change and variability to human health, the ecosystems, and social well-being.

Question. Because of these substantial modeling problems, what is the basis for EPA conducting a “Health Sector Assessment” in fiscal year 2000?

Answer. An important goal of the Health Sector Assessment is to understand the various pathways through which weather and climate may affect human health (i.e., to understand the sensitivity of human health to weather and climate). That is, the Health Sector Assessment is attempting to understand how important changes in weather and weather extremes (e.g., heat waves; storms) are for human health even under current climatic conditions. A better understanding of the sensitivity of human health to weather and weather extremes under current climatic conditions is essential before one can assess the potential effects of climate change and variability on human health. Also, this research into current sensitivities yields immediate benefits to society by enabling the public health community to develop better systems for responding to the risks posed by weather and climate (e.g., extreme heat and extreme cold).

These research and assessment activities do not rely upon climate change models.

It is also important to understand that analyses being done in the Health Sector Assessment of potential consequences of future climate change are not limited to scenarios generated by climate models. The assessments also use other information to illustrate the potential consequences of climate variability and change for human health. In addition to climate model output, the assessment work also relies on historic data to understand the sensitivity of human to change. Also, plausible “what if” scenarios are used to illuminate the sensitivity of various systems. These sensitivity analyses help to define the potential risks and opportunities posed by climate change and variability to human health and social well-being.

The human health sector is looking at how climate affects human health in the United States and at how climate change and variability might affect our health. For example, heat waves can cause death and illness, especially among the elderly poor. Air pollution, which is worse in hot weather, can make people with respiratory disease sicker and can make breathing harder for everyone. People can be hurt or even killed in severe storms and floods, or can be made sick by unclean storm water. A change in climate might increase the risk of exposure to disease-carrying rodents and insects.

The health sector team will analyze scientific research and government data on our country’s health and how climate change might affect our health. In addition, the team may develop a limited number of quantitative models of projected or possible future health impacts, where reliable data is available.

The eleven members of the health sector team come from a range of government, academic, and private institutions, including the U.S. Centers for Disease Control, the Environmental Protection Agency, the Johns Hopkins University School of Public Health, Harvard Medical School, the University of South Florida, the National Oceanic and Atmospheric Administration, and the Electric Power Research Institute.

COEUR D'ALENE SUPERFUND

Question. Since the federal government has continued to spend huge sums of taxpayer money on studies and additional research outside the 21 square mile Bunker Hill Superfund site, does the Agency have an end plan or remedy in mind? What is that plan?

Answer. The purposes of the Superfund process are: (1) to determine the nature and extent of contamination; (2) to identify existing and potential risks to human health or the environment; (3) to evaluate cleanup options; and (4) to identify a cleanup plan. EPA is in the investigation and evaluation phase of the process at this time and does not have a specific remedy identified. The remedy proposed will be a result of the RI/FS process and input from affected stakeholders and communities.

Question. How much money has been spent on the RI/FS (remedial investigation and feasibility study) outside the existing 21 square mile Superfund site?

Answer. EPA estimates that as of 5/2/99, approximately \$10,200,000 in cost associated with work in the Basin, including the RI/FS and the costs associated with litigation. In addition, EPA has incurred \$750,000 conducting residential and school soil removals outside of the existing 21 square mile Superfund site.

These costs are estimates and have not been reconciled by EPA finance personnel. All site costs are reconciled as part of the cost recovery process which occurs when the sites reach completion.

Question. How much more do you anticipate spending on the RI/FS?

Answer. EPA estimates spending an additional \$6.1 million in fiscal year 1999 and approximately \$8.8 million in fiscal year 2000 to complete the RI/FS for the Basin. These costs are estimates; actual cost will be dependent upon factors that are unknown at this time, such as the nature and extent of contamination found, the need for treatability studies, and input from a large number of stakeholders involved in the Basin.

Question. How long do you think the RI/FS will take?

Answer. EPA hopes to have the RI/FS completed in fiscal year 2000. However, schedule modifications may be necessary depending on timely receipt of funding, the findings of the study, and additional requirements resulting from stakeholder input.

Question. When do you anticipate EPA will be involved in more cleanup efforts in the Coeur d'Alene Basin rather than simply to continue studies?

Answer. EPA has been involved in numerous cleanup actions in the basin since 1993. Examples include early removal actions at the Success and Douglas tailings piles. In addition, since 1997, EPA has been conducting early actions at residential and school properties and in common use areas such as parks and beaches. EPA has also used its removal authority in the basin to support actions by other parties such as the State trustees and the mining companies. These removal actions do not address the overall contamination that is present in the basin. The RI/FS will provide the information needed to determine what appropriate actions must be implemented for a comprehensive remedy to protect human health and the environment.

Question. Can EPA pursue any cleanup activities in the Basin without completing the RI/FS?

Answer. Even before completing the RI/FS, EPA is presently conducting cleanup activities in the Coeur d'Alene basin. However, these actions in themselves may not permanently protect human health and the environment. Permanent protection may only be achieved by addressing the various sources of contaminants in the basin, which may include individual outfalls and waste piles, or segments of river banks or stream beds. In order to determine what comprehensive long-term actions need to be taken in the basin, EPA needs to conduct the RI/FS.

Question. How could damages have been assessed (under the NRD lawsuit) when an RI/FS had not been conducted? Isn't this backward?

Answer. The damages associated with injuries to natural resources may be calculated whether or not an RI/FS has been completed. However, in the present litigation, the United States has argued to the district court that it would be most logical to determine the amount of natural resource damages after determining the appropriate cleanup actions through the RI/FS and Record of Decision. Accordingly, the district court has decided that the actual dollar amount of natural resource damages would be determined in a second trial following a first trial on liability and production of the Record of Decision (ROD) for the Coeur d'Alene Basin.

Question. Is the RI/FS being used to support the NRD lawsuit? If not what is the purpose of the RI/FS?

Answer. EPA is conducting the RI/FS in the basin because we believe that there are significant human health and ecological risks associated with releases of mining wastes. These risks must be accurately identified so that appropriate cleanup actions may be selected to protect human health and the environment. In addition,

data and analyses from the RI/FS process will be made publicly available and can be used by various parties. For example, data developed by the RI/FS may be used to develop Total Maximum Daily Loads for rivers and other waterbodies under the Clean Water Act and may be relevant to the NRD litigation.

Question. Is the EPA still considering the expansion of the 21 square mile Superfund site?

Answer. The United States' position remains that the Bunker Hill NPL facility extends to all areas with mining contamination in the Coeur d'Alene Basin. While the district court's contrary determination is being appealed, EPA may proceed with formal NPL listing action to ensure that all affected areas of the basin are included in an NPL facility. At this time, however, no preliminary determinations have been made and no decisions will be made prior to further coordination with state, local, and tribal governments and a period for formal public comment.

Question. Is EPA willing to consider a legislative remedy to the Basin's problems?

Answer. At the present time, it is too early to make any determinations as to the type(s) of remedy(ies) that may be necessary to address the contamination in the basin; therefore, it is premature for EPA to consider a legislative remedy. The RI/FS process was designed to determine the extent of contamination and to develop cleanup alternatives. Once the RI/FS is complete, a remedy is selected with stakeholder and community input. EPA believes that this public process is the appropriate method for selecting a remedy in the basin.

Question. What is the TMDL standard that's been set for the Superfund site in Kellogg?

Answer. A final TMDL standard has not yet been established for the Bunker Hill Superfund site in Kellogg. In April, 1999 the United States Environmental Protection Agency (EPA) and the State of Idaho Division of Environmental Quality issued a draft TMDL for public comment for dissolved cadmium, lead and zinc in surface waters of the Coeur d'Alene River Basin in Idaho. Waste load allocations are based on river flow. The draft TMDL document is currently out for public comment. In that draft document, the most stringent wasteload allocations for the Bunker Hill Central Treatment Plant (CTP), at the lowest 7-day average daily river flow that occurs with a 10-year return period, are: 4.23E-03 pounds/day for cadmium; 1.30E-02 pounds/day for lead; and 3.09E-01 pounds/day for zinc.

Questions. Can this standard be met by the EPA in their management of effluent at the site?

Answer. The EPA is currently developing a work plan to carry out a treatability study to determine the extent to which the wasteload allocations noted above can be achieved at the CTP. EPA will be able to make that determination once the treatability study has been conducted and the results are available for review.

CARNEY SITE, ST. MARIES, IDAHO

Question. What is EPA's intention for the Carney site in St. Maries where there is creosote leakage from underground storage tanks?

Answer. EPA intends to complete characterization of creosote contamination at the site and determine what additional actions, if any, need to be taken to prevent or mitigate the further release of creosote to the St. Joe River.

Question. What types of cleanup activity is occurring?

Answer. To date, the City of St. Maries and Carney Products Company have performed a Superfund removal action under a Unilateral Administrative Order (UAO) with the EPA, to remove exposed creosote and creosote-contaminated soil from the bank of the St. Joe River. They have also completed a removal site evaluation under the UAO to characterize the extent of contamination in soils and groundwater.

Question. Do you anticipate clean up in conjunction with the city/county?

Answer. It is likely that additional cleanup action will be required to mitigate extensive creosote contamination present in bottom sediments of the St. Joe River and to prevent further release of creosote from the site. The City of St. Maries has been identified as a potentially responsible party (PRP) and may be responsible, along with other PRPs, for this work.

Question. Is the EPA recommending this site for the NPL?

Answer. EPA has just recently received the data from the site investigation, that will be used to calculate a preliminary Hazard Ranking System Score. This evaluation will determine whether the site is eligible for the NPL.

REGIONAL HAZE RULES

Question. Last year, in the EPA Appropriation Conference Report, Congress encouraged EPA to re-propose the Regional Haze Rule. How do you feel you responded to this report language?

Answer. The EPA gave serious consideration to the congressional and other recommendations to re-propose the regional haze rule. However, we decided that re-proposal would not be necessary for a number of reasons. First, the EPA provided an extensive opportunity for comment on the proposal, including an extension of the original comment period by six weeks. More than 1200 comments were received on the proposal, many of which requested EPA to move forward with the rule.

Second, EPA provided a second comment period in September 1998 on a notice of availability of additional information that became available after the close of the initial comment period. This information included the regional haze SIP timing requirements included in the TEA-21 legislation, adopted in June 1998, and a June 1998 letter including significant comments from the Western Governors' Association, developed with input from a broad range of stakeholders.

Third, over the course of the proposal period, EPA engaged in many meetings and discussions with interested stakeholders on various aspects of the rule. EPA was very aware of stakeholder views on the range of issues in the proposed rule. The issues raised by those requesting re-proposal generally were issues already under consideration by EPA due to comments received on the proposed rule or the notice of availability.

Fourth, EPA believed that a re-proposal would only serve to further delay the finalization of the regional haze program when its statutory deadline had already been exceeded. In fact, several environmental groups later issued a notice of intent to sue the Agency for failure to issue the rule in accordance with the statutory schedule for action.

As we anticipated at the time we decided not to repropose the rule, the final rule reflects many changes that are significant issues identified in public comments.

Question. Approximately 15 Governors from throughout the country requested EPA to re-propose the Regional Haze Rule, even after last fall's comment period. Why did you ignore these requests? What specific contact concerning this rule did you have with Governors on this rule prior to its issuance.

Answer. EPA considered these requests for re-proposal, and we also considered requests from the Governors of Utah, California, Maine, Vermont and New Hampshire who urged that we proceed with the regional haze rule. For the reasons noted above in the response to the previous question, EPA decided not to re-propose the final rule.

Since the close of last fall's comment period, we have had the following specific contacts with Governors related to the Regional Haze Rule:

(1) November 13, 1998 letter from Robert Perciasepe, EPA, in response to October 5, 1998 letter from Florida Governor Lawton Chiles.

(2) December 1, 1998, Meeting with Governor Leavitt of Utah.

(3) December 9, 1998 letter from Midwest Governors' Conference signed by Governors of Indiana, Kansas, Wisconsin, Michigan, Ohio, Illinois, Minnesota, Iowa, Missouri, Nebraska, South Dakota, and North Dakota.

(4) January 4, 1999 letter from Southern Governors Association to the President signed by Governors of Virginia, North Carolina, Tennessee, Kentucky, Mississippi, Missouri, Arkansas, West Virginia, Alabama, Oklahoma, and Louisiana.

(5) January 27, 1999. Meeting with Midwest Governor's conference.

(6) February 8, 1999 meeting with EPA and Southern Governors' Association to discuss Regional Haze Rule and Regional Planning. March 24, 1999 meeting with the Southern Governors' Association.

(7) March 30, 1999 letter from Southern Governors' Association to Lydia Wegman, EPA.

(8) March 5, 1999 letter to Vice President Gore from Governor Shaheen of New Hampshire and Governor Dean of Vermont.

(9) April 6, 1999 letter to Vice President Gore from Governor King of Maine.

(10) March 24, 1999 letter from Governor Davis of California.

(11) April 15, 1999 letter from Governor Leavitt of Utah on behalf of the Western Governors' Association. April 15, 1999 meeting with Western Governors' Association.

(12) April 21, 1999 letter from Robert Perciasepe, EPA in response to March 20, 1999 letter from Colorado Governor Owens.

Question. If all power plants in the West were subjected to Best Available Retrofit Technology (BART), what degree of visibility improvement would you expect in the West?

Answer. Power plant sulfur dioxide emissions are a significant contributor to sulfate concentrations in the West, and sulfate particles are a significant contributor to visibility impairment in the West. We have estimated that sulfates contribute about 30 to 60 percent of the aerosol light extinction on the worst visibility days in most western Class I areas. We do not, however, have a precise estimate of the fraction of that sulfate contribution that is due to power plants, nor do we have an

available estimate of the degree of visibility improvement that would be achieved from BART-level controls in the West. It should be noted that the BART provision does not affect all power plants in the West, but rather potentially affects any power plant with the potential to emit more than 250 tons of any visibility impairing pollutant that was placed in operation between August 1962 and August 1977. However, to the extent that sulfate is a significant contributor to class I area visibility impairment, BART level emission controls on power plants would be expected to achieve a significant improvement in visibility.

Question. What is the statutory authority for a "regional BART" in view of the specific source requirement?

Answer. In establishing appropriate BART emission limits section 169A(a)(2) of the Clean Air Act requires States to take into account the following factors:

- The costs of compliance;
- The energy and nonair quality environmental impacts of compliance;
- Any existing pollution control technology in use at the source;
- The remaining useful life of the source; and
- The degree of improvement in visibility which may reasonably be anticipated to result from the use of such technology.

The statutory language is clear that the State should consider "the existing pollution control technology at the source" and "the remaining useful life of the source." The statute also requires the States to consider "the degree of improvement in visibility which may reasonably be anticipated to result from the use of such technology." EPA interprets the language "from the use of such technology" to refer to the general application of BART to sources subject to BART. As a result, EPA believes that it is reasonable to interpret this provision as requiring the State to consider, as part of its source-specific analysis, the cumulative impact of applying retrofit controls to all sources subject to BART to estimate the degree of visibility improvement which may reasonably be anticipated to result from the use of BART.

Question. What will be the cost of imposing the Regional Haze Rule on power plants? On stationary sources generally?

Answer. The Regional Haze rule provides States with the opportunity to make decisions on reasonable progress goals, emissions management strategies, and best available retrofit technology. Until those decisions are made by the States, the cost of the regional haze rule for power plants and other stationary sources is unknown.

However, in order to comply with the requirements of Executive Order 12866 and the Congressional Review Provisions of the Small Business Regulatory Enforcement Fairness Act, the U.S. Environmental Protection Agency completed an illustrative assessment of the potential annualized cost of the rule in 2015, a year near the end of the first long term progress period. The scope of the illustrative cost analysis included 4 hypothetical reasonable progress goals and two sets of control strategies. For the example strategies analyzed, the estimated range of power plant costs is \$248 million (for a control strategy which provides for the use of fugitive dust controls and is aimed at a 1.0 deciview improvement in 15 years) to \$595 million (for a control strategy which precludes the use of certain fugitive dust controls and is aimed at a 10 percent deciview improvement in 10 years). These cost estimates are in 1990 dollars and represent 23 and 16 percent of the corresponding total cost estimates. For the same scenarios, the range of estimated cost for non-utility sources with industrial classification codes is \$787 million to \$2858 million in 1990 dollars.

We stress that the above estimates are illustrative, and that States have considerable discretion to establish their own reasonable progress goals so long as they consider the statutory factors and take into account the results of the analyses required by the rule. In addition, States are responsible for selecting and adopting control strategies, and have flexibility to select cost-efficient programs, including those which provide for emissions trading across emission source categories.

QUESTIONS SUBMITTED BY SENATOR MIKULSKI

ORIMULSION: CONCLUSIVE REPORT ON RESEARCH

Question. From correspondence I have seen that has been sent to colleagues of mine who have inquired about the research on the use of Orimulsion as a fuel, I understand that research will be conducted this calendar year. I agree that this is an appropriate time frame. Therefore, am I correct in expecting that a conclusive report on Orimulsion will be issued from the EPA by the end of the year?

Answer. A report on Phase 1 research activities is planned to be submitted for OMB review by the end of the fiscal year and should be available to Congress by the end of the calendar year. Phase 1 research activities are pilot-scale testing of

air emissions from Orimulsion, toxicology testing of particulate matter captured during the pilot-scale tests, a review of existing scientific results, and a preliminary environmental assessment of using Orimulsion as a fuel for power generation.

The Orimulsion Technology Assessment Plan (OTAP) states that the research program will be completed in three phases, if necessary. The OTAP calls for an evaluation of the Phase 1 results before making a decision as to whether further work will be necessary to address questions found during Phase 1. If further study is required to adequately address remaining questions, the report of Phase 1 results will be issued and will include a discussion of the remaining questions and additional research requirements. If scientific results indicate no further work is necessary, the Phase 1 report will be conclusive, and it is unlikely the Agency will proceed with Phase 2 and 3.

ORIMULSION: RESEARCH FUNDING

Question. Is there adequate funding that is currently dedicated to the research activity that will allow EPA to complete its conclusive report by year's end? If not, how do you plan to obtain such funding from existing sources to permit the completion of the report by the end of 1999?

Answer. There is adequate funding to complete the planned Phase 1 activities, which are scheduled to be submitted for OMB review by the end of the fiscal year. Phase 1 activities include: pilot-scale testing of air emissions from Orimulsion, toxicology testing of particulate matter captured during the pilot-scale tests, a review of existing scientific results, and a preliminary environmental assessment of using Orimulsion as a fuel for power generation.

QUESTIONS SUBMITTED BY SENATOR LEAHY

DIOXIN REASSESSMENT STUDY

Question. It is my understanding that EPA has been drafting a dioxin reassessment study and plans to release it by the end of this year. As we found with the Mercury Report to Congress, a factual basis detailing emission volumes, sources, and health considerations is needed for developing legislative proposals and to shape the public policy debate. Please provide to the Subcommittee your timetable for completing the study, interim milestones and deliverables leading up to release of the final reassessment.

Answer. EPA's Dioxin Reassessment effort is producing three documents:

Estimating Exposure to Dioxin-like Compounds.—This document, discusses chemical/physical properties, sources, environmental levels and background exposures and site-specific assessment procedures.

Health Assessment Document for 2,3,7,8-TCDD and Related Compounds.—This document discusses pharmacokinetics, epidemiology, cancer, various noncancer health effects and dose-response.

Integrated Summary and Risk Characterization for Assessment of 2,3,7,8-TCDD and Related Compounds.—This document summarizes the findings of the health and exposure documents and integrates the information to reach general conclusions about the impacts of dioxin like compounds on human health and specifically identifies the risks that may be occurring in the general population at background exposure levels. The risk characterization articulates the strengths and weaknesses of the available evidence and presents assumptions made and inferences used. It is meant to provide a balanced picture of dioxin science for use by risk managers inside and outside of EPA.

The process for developing these documents has been open and participatory. They have all been developed in collaboration with scientists from inside and outside the Federal Government. Each document has undergone extensive internal and external review, including review by EPA's Science Advisory Board (SAB). In their 1994 review, the SAB recommended substantive revisions to both the Dose-Response Chapter of the Health Effects Document and the Risk Characterization. These two sections were to be revised with the participation of and input from a broad cross-section of outside interests from both the public and private sectors, then submitted for external peer review, and subsequently brought back to the SAB for re-review. In addition, the SAB suggested adding a de novo chapter on the Toxic Equivalency Factors (TEF) to gather in one place the discussion and scientific information on the complex issue and use of TEFs for dioxin and dioxin-like compounds.

Another major part of the dioxin reassessment activity is the exposure assessment. During the SAB's review of the draft assessment, the Board recommended some revisions to the dioxin emissions inventory that were included in the draft ex-

posure assessment document. In response to both SAB comments and public comments on this section, EPA has substantially revised the source inventory and held a two-day external peer review meeting for expert scientific review of the draft document in June 1998. Currently, the exposure assessment is undergoing revision and incorporation of the peer reviewed inventory. As recommended by the SAB, this section will not undergo any further review by the Board. Information from the exposure assessment has been feeding into the revision of the Integrated Summary and Risk Characterization.

Status and Schedule

Integrated Summary and Risk Characterization:

- Internal EPA review—June 1999
- External review—July 1999
- External Peer Review—September 1999
- SAB review—November 1999

TEF Chapter:

- Internal EPA review—June 1999
- External review—July 1999
- External Peer Review—September 1999
- SAB review—November 1999

Dose-Response Modeling Chapter:

- Internal review—December 1996/January 1997
- External Peer Review—March 1997
- Writing Team Meeting—July 1999
- SAB review—November 1999

Completed reassessment: Publically available—Expected Early 2000

It is important to note that EPA remains committed to a fully open and participatory process as it finalizes the dioxin reassessment.

Note: All dates are contingent on the extent and nature of the peer review comments.

KNOWN OR SUSPECTED CARCINOGENS

Question. The Occupational Health and Safety Administration (OSHA) under the Department of Labor maintains a list of “known or suspected carcinogens.” Many, if not all, of these have been reported on several years in the Toxics Release Inventory reports. I would appreciate receiving an analysis that looks at emissions of “known or suspected carcinogens” for each of the past five years. Please provide the following three reports for 1993–1997 with the total change since 1993: (1) the top 20 3-digit SIC codes for on-site releases and total releases, (2) releases of OSHA carcinogens by state, and (3) on-site releases and total releases by chemical and media. For each “known or suspected carcinogen” and associated industry, I would like to know whether a regulatory emissions control strategy is in place (e.g., a final MACT standard has been promulgated) or, where a strategy is not yet in place, EPA’s current schedule for developing and implementing a strategy.

Answer. In addition to providing an analysis of air, water and land releases from the TRI data (see attached charts), EPA can provide an analysis of air releases (emissions) from the National Toxics Inventory (NTI). The NTI contains much of the air release information from TRI, which is self-reported by industry, but also includes additional data. For example, while the 1996 TRI contains estimates of air toxics emitted from about 13,000 facilities, the 1996 National Toxics Inventory (NTI) contains emissions estimates of air toxics emitted from more than 38,000 facilities.

The TRI requires manufacturing facilities and facilities in seven new sectors to report annual chemical releases and other chemical waste management. Although the NTI includes various other sources of emissions (i.e., mobile and area, in addition to point sources), the NTI relies on emission estimates, and, as such, the NTI emission data varies in quality and completeness among source categories, geographic location, and estimation method.

EPA has a baseline NTI which represents data for the period 1990–1993, and a draft NTI for 1996. The NTI contains estimates of 188 hazardous air pollutants from point, area, and mobile sources. Of these 188 hazardous air pollutants, 134 have been classified by either EPA or the International Agency for Research on Cancer as carcinogens (list is attached).

The emissions data in the NTI could be presented by Source Classification Code (SCC) and/or MACT code, which is more closely aligned with the source of emissions than would be the SIC code, which is related to the economic sector. An analysis that could be done to summarize carcinogen emissions and identify regulatory strategies which are targeting these emissions is:

Use baseline NTI data (1990–1993) and 1996 draft NTI data to compare carcinogenic hazardous air pollutant emissions by source category nationally and for each state. Identify source categories with existing and planned MACT standards, and industries for which the Agency has other types of regulatory activities planned or in place (for example, control technology guidelines to reduce volatile organic compounds, which are a precursor to ozone formation).

Question. Lastly, I would like to know whether EPA currently coordinates with OSHA or has plans to begin working with OSHA, to ensure that workers and people living in the proximity of significant sources of “known or suspected carcinogens” are being adequately protected from these emissions.

Answer. EPA began discussions with OSHA this Spring on the potential to coordinate a number of air toxics regulations with OSHA regulations. On June 17–18, 1999, EPA, OSHA and NIOSH jointly sponsored a workshop on “Common Sense Approaches to Protecting Workers and the Environment.” At this workshop, EPA and OSHA acknowledged that they would work cooperatively on a number of toxics issues.

To the extent possible, the Agency plans to include OSHA review prior to proposal of future air toxics regulations. In addition, EPA and OSHA are in the process of coordinating on worker exposure issues. Specifically, EPA has committed to help address any major issues that may exist where reductions in environmental emissions inadvertently have an adverse effect on worker exposures. Also, OSHA plans to provide EPA with quantitative risk assessments to help with EPA’s priority-setting and efforts to address emissions impacting people living in the proximity of significant sources of air toxics. Staff from both Agencies plan to meet later this year to further coordinate these efforts.

Below is a list of 134 HAPs that either EPA or IARC have classified as carcinogens. Most of these are listed singly under section 112(b) of the Clean Air Act Amendments, but some (particularly PAHs) fit within HAP categories.

	Ratings
EPA:	
A	Known.
B	Probable.
C	Possible.
D	No evidence.
IARC:	
1	Known.
2A	Probable.
2B	Possible.
3	No evidence.

Compounds classified by EPA and/or IARC as known, probable, or possible human carcinogens.

TRI ON-SITE AND TOTAL RELEASES OF OSHA CARCINOGENS, BY STATE, 1993–1997

Question. Odd pattern B did one new plant open up in 1995?

Answer. Wyoming—Two facilities account for most of the increase from 1994 to 1995 in total releases of carcinogens in Wyoming. FMC Corp. in Sweetwater, WY reported other chemicals in 1994 but did not report any OSHA carcinogens until 1995. The large increase is in benzene (64,000 pounds of air emissions). Frontier Refining Inc. in Cheyenne, WY reported 8,861 pounds releases of benzene in 1994 (mostly air emissions) and 25,495 pounds of releases of benzene in 1995 (mostly air emissions). The total increase in OSHA carcinogens from 1994 to 1995 from these two facilities is 78,392 pounds. The total increase for Wyoming is 82,994 pounds. Therefore, these two facilities account for 94 percent of the increase in total release of OSHA carcinogens in Wyoming from 1994 to 1995.

Question. Washington, D.C., Explain the total release change.

1994	5
1995	255
1996	250
1997	

Answer. The facility that reported these numbers is the Bureau of Engraving and Printing. This facility has reported to TRI as a federal facility since 1994. The above mentioned numbers are transfers to dispose of nickel.

Question. Louisiana—Explain the increase from 1996 to 1997.

Answer. Two facilities account for the majority of the change from 1996 to 1997. Borden Chemicals & Plastics Ops. LP, LA HWY. 73 & 30, Geismar, LA reported an increase of 1,627,322 pounds. This increase was primarily benzene. Monsanto-Luling, 12501 River Rd., Luling, LA reported an increase of 1,516,000 pounds. This increase was primarily formaldehyde.

Question. Is the reporting universe the same from 1993–1997?

Answer. For the purpose of this table (TRI On-site and Total Releases of OSHA Carcinogens, by State, 1993–1997), the reporting universe is the same for 1993 to 1997. The same list of chemicals is used for comparison across all years, see Anote at bottom of table regarding this issue.

Question. If not, should EPA be comparing 1993 to 1997?

Answer. N/A—answer provided above.

MERCURY THRESHOLDS AND EMISSIONS

Question. On March 12, 1999, the Governors of the seven New England states wrote to you urging that EPA adopt “dramatically lower reporting thresholds for mercury and expand reporting sectors to include all the largest sources of mercury emissions.” The letter went on to state that “the proposed limit of 10 pounds is far too high and will not help state efforts to achieve virtual elimination of anthropogenic mercury emissions.” How has EPA responded to the Governors? Please provide the subcommittee a copy of that response.

Answer. The EPA’s Administrator received the attached letter dated March 12, 1999, from the New England Governors Conference, Inc., urging EPA to adopt activity thresholds for mercury dramatically lower than the Agency’s preferred option of 10 pounds as proposed in the January 5, 1999 proposed rule expanding and modifying the EPCRA section 313 reporting requirements for persistent bioaccumulative toxic (PBT) chemicals. The letter was routed to the Office of Pollution Prevention and Toxics where it was logged into the docket [# OPPTS 400132] created for receiving comments on the proposed rule.

Guided by the requirements and principles of the Administrative Procedures Act, the Agency will consider the views of those who commented during the public comment period which closed April 7, 1999. Typically, all of the comments received are logged-in, categorized by issue and evaluated as part of the development of the final rule, which is currently scheduled to be issued in late October 1999. As required by law, the Agency will respond to significant comments in the preamble to the final rule, and the Agency also prepares a more detailed Response to Comments document.

The Agency received well over 37,000 submissions to the docket (including 35,000 postcards expressing a similar comment) on the proposed rule. The activity threshold level for reporting EPCRA section 313 PBT’s is of concern to many constituents.

The Agency received numerous comments regarding the threshold levels as proposed, including recommendations similar to those submitted by the New England Governors Conference, Inc. Serious consideration will be given to those concerns regarding the threshold levels for mercury and the other relevant PBT chemicals in our deliberations toward development of a final rule.

NO_x TRADING PROGRAM

Question. Regarding the NO_x trading program, what are EPA's plans and timetable for implementing environmental measures of progress for this program? Will those measures reflect regional differences?

Answer. The Acid Rain Program will be developing and operating the NO_x Allowance and Emissions Tracking Systems for the NO_x Budget Program, as requested by the 12 States of the Ozone Transport Region (OTR). This is in addition to administering the SO₂ and NO_x provisions under Title IV of the Clean Air Act. The first year of compliance for this program is 1999 (with the first compliance certification process being conducted by EPA for the OTR States in the first quarter of 2000). Over 900 facilities will require certification of emissions monitors and will report quarterly emissions to EPA beginning in 1999. The OTR program is expected to increase EPA's allowance trading activities by approximately 50 percent over the Acid Rain Program.

Beginning in 1999, we expect that the OTR NO_x Budget Trading program will result in approximately a 50 percent reduction of NO_x emissions from the 1990 baseline; this level will be maintained annually through 2002. These reduction will be over and above those achieved through implementation of Title IV of the Clean Air Act Amendments. As with other programs under Title I of the Clean Air Act, the OTR States are required to conduct audits to ensure that the Program is providing expected environmental outcomes. These audits will be conducted every three years beginning in 2002.

LAKE CHAMPLAIN: SURVEY OF FISH AND GREAT LAKES EPIDEMIOLOGICAL STUDY

Question. On page II-19 of your fiscal year 2000 request, the Agency lists one of the activities to help meet the goal of ensuring safe drinking water, fish, and recreational waters continued work on a "nationwide survey of toxic residues in fish and complete epidemiological studies in the Great Lakes * * * on health effects of exposure to selected bioaccumulative toxics." Is there an opportunity for Lake Champlain to be included in this survey? What would be the cost of including Lake Champlain in the study and does the Agency have any plans to expand the survey outside of the Great Lakes?

Answer. There is a chance that Lake Champlain will be included in the national fish tissue survey to determine the extent to which fish in waters of the United States are contaminated with persistent bioaccumulative toxic chemicals. A set of 900 lakes was randomly selected for this study. Lake Champlain was not included in this set. The random selection was based on latitude/longitude positions. Upon making an actual physical check of the randomly selected sites, we are finding that some of the information in the geographic database was not correct. Thus, we suspect that many of the 900 in the first set will not meet the study definition of a lake. If and when the sample size falls below 750 lakes, we will make subsequent selections of 25 lakes from a second sample of 900 lakes in the U.S. Lake Champlain is one of the randomly selected lakes in this second set; so there is a chance that it will be selected.

The Agency will collect and analyze two composite samples of fish (one bottom fish species and one predator/sport fish species) at each sampling site. We expect that the two samples will cost about \$8,000 each to analyze. Costs to physically collect the samples in the field for the lakes in New York and Vermont could range from \$2,000 to \$4,000. Thus, we expect that total costs for obtaining and analyzing the samples from Lake Champlain, if selected, would range from \$18,000 to \$20,000.

The Great Lakes National Program Office also conducts a fish contaminant program in the Great Lakes in conjunction with the Great Lakes States. Although this program does not include Lake Champlain, information and lessons learned in the Great Lakes program are transferable to other fish contaminant programs (e.g. the nationwide fish survey).

The Great Lakes epidemiological studies are conducted by the Agency for Toxic Substances and Disease (ATSDR). These studies are generally local in nature and would not include Lake Champlain.

LAKE CHAMPLAIN: GREAT LAKES PROGRAM

Question. EPA is requesting an increase over the fiscal year 1999 enacted funding level to reduce transboundary threats in shared North American ecosystems through the Great Lakes National Program. Again, is there an opportunity for Lake Champlain to be included in this program? What type of activities are currently being undertaken under this program?

Answer. Lake Champlain is not directly included in the Great Lakes National Program, which is established by statute, Section 118 of the Clean Water Act, and international agreement, the Great Lakes Water Quality Agreement with Canada (GLWQA). The Clean Water Act and GLWQA both describe the program as encompassing bodies of water "at or upstream from the point at which [the St. Lawrence River] becomes the international boundary between the United States and Canada" (quoting from the Great Lakes Water Quality Agreement). Lake Champlain is downstream from this point.

Notwithstanding this limitation, EPA's Great Lakes activities do benefit Lake Champlain because of the similarity of the environmental problems of both, particularly invasive species, persistent toxics, and nutrients. EPA's Great Lakes National Program Office acts as a laboratory to pilot ways of addressing those problems. Much of what is learned in the Great Lakes is applicable to Lake Champlain.

Under the Clean Water Act, GLNPO oversees fulfillment of EPA's international commitments under the U.S.-Canada Great Lakes Water Quality Agreement. It monitors Lake ecosystem indicators; manages and provides public access to Great Lakes data; helps communities address contaminated sediments in their harbors; supports local protection and restoration of important habitats; promotes pollution prevention through activities and projects such as the Binational Toxics Strategy with Canada; and provides assistance to implement community-based Remedial Action Plans for Areas of Concern and for development and implementation of Lakewide Management Plans. Assistance is provided in all of these areas through grants and the provision of direct technical support. In addition, to support efforts for the Lake Champlain Management Conference the fiscal year 2000 budget requests \$1 million.

LAKE CHAMPLAIN: ACTION PLAN TIME FRAME

Question. There has been considerable interest within Vermont and New York for speeding up the timeframe for the Lake Champlain Action Plan from 20 to 10 years. Focusing on the action items where EPA is identified as a key federal partner, how much annual funding would be required for EPA to meet the goals of the Action Plan within 10 years? Since additional agricultural non-point cost share funding is required to accelerate phosphorus reduction, will EPA consider committing funds to supplement those currently made available by USDA and the states of Vermont and New York?

Answer. Accelerating the Lake Champlain Basin Program (LCBP) implementation plan from 20 years to 10 years relates only to phosphorus reduction goals. The LCBP's Opportunities for Action plan was completed in October 1996 and is based on a 20-year phosphorus reduction schedule. Opportunities for Action states that the estimated annual cost needed to implement a phosphorus reduction strategy in the Lake Champlain Basin is about \$12.6 million. This would achieve all in-lake phosphorus standards except those established for the southern portion of the Lake and Missisquoi Bay.

On May 18, 1999, the LCBP Steering Committee discussed the growing public interest associated with accelerating the Lake Champlain phosphorus reduction strategy time frame from 20 years to 10 years. Although the Steering Committee embraced the general concept as a worthy goal, it was decided more analysis is needed to determine the feasibility of accelerating the time frame. In making this decision, the Steering Committee must ensure that

- We look at this issue holistically (recognizing both point and nonpoint source needs);
- The 10-year implementation time frame is a realistic program goal;
- The public and regulated community are aware of the time frame reassessment;
- Natural Resources Conservation Service (NRCS) technical support will increase in the LC Basin during the next 10 years;
- Funding will not be obtained at the expense of other key Clean Water programs; and,
- Future growth issues are factored in.

The Steering Committee supported an evaluation of this idea. An outline is now being developed to discuss the formation of a focus group to consider the strengths and weaknesses of this proposal. The focus group will determine a realistic time

frame for achieving phosphorus goals (20 years as originally intended, 10 years, or other) and additional issues associated with technical feasibility, cost, staffing, implementation, and monitoring of success. The focus group will report back to the Steering Committee in September.

With respect to supplementing USDA and state funding, EPA has provided and continues to provide millions of dollars in Clean Water Act funds to Vermont and New York which can be used to implement agricultural nonpoint source pollution control practices. The funding provided through the Clean Water Act is obligated to the States, who in turn make specific funding decisions.

CLEAN LAKES PROGRAM (SECTION 314): 319 PROGRAM FUNDING

Question. EPA has stated that it intends to fund Clean lakes Program (Section 314) elements as part of the 319 program. How much funding from the 319 program in fiscal year 1998 and 1999 was used to address the elements of the Clean Lakes Program such as water quality monitoring, feasibility studies and lake demonstration projects? How does this compare to when the 314 program was funded separately from the 319 program?

Answer. In recent years, EPA has encouraged states to use the section 319 Nonpoint Source Program to support the lakes and reservoir work which was previously done under the section 314 Clean Lakes Program. In our guidance, we have emphasized that the Clean Lakes Program elements (e.g., Statewide Lake Water Quality Assessments to assess water quality across a state, Phase I Diagnostic/Feasibility Studies to determine the causes of pollution in a specific lake and to recommend control actions, Phase II Restoration and Protection Implementation Projects to implement needed controls, and Phase III Post-Restoration Monitoring Studies to monitor the effectiveness of projects) which were previously funded under the section 314 Clean Lakes Program are eligible for funding under the section 319 Nonpoint Source Program. (Questions and Answers on the Relationship Between the Sec. 319 Nonpoint Source Program and the Sec. 314 Clean Lakes Program, US EPA., Nov. 1996, can be found on the Internet at: http://www.epa.gov/owow/NPS/Section319/q_percent_26a.html).

EPA developed a section 319 Grants Reporting and Tracking System (GRTS) with the States to track mutually agreed upon mandatory data elements for all section 319 grants. GRTS shows that states are using section 319 to support restoration and protection activities for lakes and reservoirs. However, states do not always refer to their lakes activities using historic Clean Lakes Program element nomenclature i.e., Lake Water Quality Assessments, Phase I studies, etc.

To estimate section 319 resources directed specifically to lakes and reservoirs in fiscal year 1998 (GRTS data is not yet available for fiscal year 1999), EPA queried the tracking system to identify section 319 projects where "lake," "reservoir," or "pond" are included in the project title and also where states identify only lakes as the water body type benefitted in the project. The tracking system shows that in fiscal year 1998 about 9.2 percent of reported section 319 program funds were used in specific projects for lakes, reservoirs or ponds (see Table 1 for a national summary and Table 2 for specific lakes projects funded by States in 1998). Based on these figures, we estimate that nationally \$9.7 million in section 319 grants were provided to directly benefit lakes and reservoirs in fiscal year 1998.

In addition, we queried the GRTS tracking system to determine the amount of section 319 funds that states identified as benefitting multiple water body types e.g., projects that benefit lakes as well as other water bodies in a watershed such as streams, rivers, wetlands, etc. The query identified \$17.4 million of section 319 funds for fiscal year 1998 that states report benefit multiple water bodies (again, fiscal year 1999 data is not yet available).

While it is difficult to determine exactly how much of the above funds benefit lakes, clearly a portion of these funds support the objective of restoring and protecting lakes and reservoirs. These projects that benefit multiple water body types run the gamut of nonpoint activities i.e., from statewide educational programs, to specific watershed projects, to support for state/local nonpoint source personnel.

Thus, in addition to the section 319 program funds which are used in specific projects for lakes, reservoirs or ponds, a portion of the projects that benefit watersheds as a whole also help to protect and restore lakes. Further, in fiscal year 1999, funds appropriated for the section 319 program doubled from \$100 million to \$200 million. We expect that with this increase in resources we will see an increase in the amount of lakes work funded under section 319.

Regarding your second question, in 1994, the last year that the section 314 Clean Lakes Program was funded, Congress appropriated \$5 million for the program. Fol-

lowing is the percentage of these funds which were awarded for the various Clean Lakes Program elements in fiscal year 1994:

- 43 percent were invested in Statewide Lake Water Quality Assessments;
- 34 percent were invested in Phase I projects;
- 19 percent were invested in Phase II projects; and
- 4 percent were invested in Phase III projects.

We do not have comparable data in the GRTS system to directly compare how much of the section 319 grants are being used for the Clean Lake Program elements. But as the above data indicates, a considerable amount of lakes work is being funded under section 319. Further, while projects may not be identified as “Phase I” or “Phase II” projects, similar lakes-related work as was funded under section 314 is now funded under the section 319 program. Table 1 Amount of Lakes Work Funded Under the Section 319 Nonpoint Source Program in fiscal year 1998

TABLE 1.—AMOUNT OF LAKES¹ WORK FUNDED UNDER THE SECTION 319 NONPOINT SOURCE PROGRAM IN FISCAL YEAR 1998

Fiscal year	Amount of 319 funds appropriated (in millions)	Amount of 319 funds reported in 319 tracking system as of 5/3/99 (in millions)	Amount of lakes work reported by states ²	Percent of reported 319 funds used for lakes work	Estimated national total amount of appropriated funds used for lakes work ³
1998	\$105	\$51	\$4.7	9.2	\$9.7

¹ For the purposes of this table, “Lakes” refers to lakes as well as reservoirs and ponds.

² This includes section 319 projects where “lake,” “reservoir” or “pond” is included in the project title, and also projects where states identify only lakes as the water body type benefitted in the project.

³ The percentage of section 319 funds used for lakes by states which reported is assumed to be the same for all non-reporting states, multiplied by the total section 319 funds appropriated.

Total 1998		\$4,715,451

NONPOINT SOURCE POLLUTION PROJECTS

Question. The EPA is requesting authorization for new flexibility to allow states to allocate up to 20 percent of their Clean Water State Revolving Fund for nonpoint source pollution projects. If this authorization is granted, how will EPA monitor the use of these funds and will there be any requirements for coordination with the USDA Natural Resources Conservation Service priority watershed areas under the Environmental Quality Incentives Program? Will the states have the flexibility to use the funding by either their agriculture department or their environmental agency?

Answer. EPA will monitor and track the use of the CWSRF nonpoint source and estuary management grant funds through the existing CWSRF National Information Management System (NIMS). Each year states submit data for NIMS regarding all loan activity and the types of projects funded. The additional grant flexibility will allow states to provide grant resources (not to exceed 60 percent of project costs) separately, or in combination with loans to make projects affordable. All proposed CWSRF activities are discussed in each state's annual Intended Use Plan (IUP), which describes the funds available and proposed projects. The IUP is made available to the public for comment. Actual CWSRF activities are described in Annual Reports as well as NIMS.

There are no requirements for coordination with USDA. However, under the Clean Water Action Plan, all States have developed Unified Watershed Assessments delineating their priority watersheds for restoration activities and are now working on specific Watershed Restoration Action Strategies for these watersheds. EPA and USDA are committed to work with States to target and mutually marshal all available funding that can help restore State priority watersheds, including CWSRF and EQIP funds.

The state agency designated to receive the CWSRF capitalization grant will receive the entire state allotment. Up to 20 percent of that allotment may be used for nonpoint source or estuary management grants, at the state's discretion. In most cases, state environmental agencies have direct responsibility for the CWSRF program and state agricultural agencies have a leadership role on EQIP. States do, however, have the flexibility to determine how to best use and coordinate these funds to meet their high priority agricultural nonpoint source needs. Projects that the Agricultural Department wants to fund would need to be included in the state's 319 Nonpoint Source Management Plan or 320 Estuary Comprehensive Conservation and Management Plan, as well as the CWSRF Integrated Priority List. Many state CWSRF loan programs have already developed partnerships with state Agricultural Departments to provide CWSRF loans for nonpoint source projects. For instance, Delaware, Minnesota, West Virginia, and Ohio work with NRCS to identify needed agricultural Best Management Practices, design projects, and develop cost estimates before making a CWSRF loan.

QUESTIONS SUBMITTED BY SENATOR HARKIN

ANIMAL WASTE: LIVESTOCK PERMITS FUNDING

Question. I am told that many states lack the personnel to make the regular inspections of large animal feeding operations that would be required for meaningful

environmental oversight under the Clean Water Act. What additional funding is EPA making available to states to implement the Administration's directives on livestock permits? What funding do you think could effectively be used in 2000?

Answer. In fiscal year 1999, the President requested and Congress appropriated a \$20 million dollar increase in Clean Water Act (CWA) Section 106 grants for State and Tribal water quality program administration. The fiscal year 2000 President's Budget continues this grant increase. These additional funds can be used by States for programs including inspections to address concentrated animal feeding operations (CAFOs), which are regulated under the CWA permitting program. Also, EPA has awarded a \$5 million dollar grant to America's Clean Water Foundation (ACWF). ACWF, working with the National Pork Producers Council, will train individuals to do environmental assessments of pork production facilities.

One of the actions in the Strategy is for EPA and USDA to develop a joint evaluation of the costs and benefits of this Strategy and the options that may be considered in developing revised CAFO regulations. Currently EPA is focusing on the C-B for the revised CAFO rules. We also plan to work with USDA to develop a joint evaluation of the Cost Benefits of developing and implementing Comprehensive Nutrient Management Plans (CNMPs). EPA and USDA are also working with our State partners on ways to coordinate our respective programs to achieve the needed water quality goals through proper manure management. In the near term, EPA and USDA will continue to support ways to use existing programs such as Section 319 (Nonpoint Source), Section 106 State Program Funds) and Environmental Quality Incentives Program (EQIP) to support implementation of the Strategy. At the same time, EPA and USDA expect that the private sector will provide key support for helping producers, both technically and financially, to ensure that the 1.37 billion tons of manure produced by AFOs is managed in a way that protects water quality.

ANIMAL WASTE: RESEARCH AND DEVELOPMENT TECHNIQUES FOR POLLUTION STANDARD

Question. The development of a new generation of management tools and technologies for handling manure at large-scale livestock operations is essential for environmental protection. I understand EPA is currently revising its effluent guidelines to specify the kinds of technological approaches livestock operations should use to limit water pollution. What funding is EPA making available for the research and development of a range of affordable technologies that will help livestock producers comply with stricter pollution standards?

Answer. EPA is funding studies to identify a new generation of management tools and technologies in support of the effluent guidelines regulation. Most of this work focuses on technology operating on a full-scale basis at existing animal feeding operations. The focus of the studies is to better understand the performance of some of these technologies and to quantify the costs to install, operate and maintain these technologies.

Through the Effluent Guidelines effort, EPA has contracted with North Carolina State University. They have provided EPA with expertise gained through their research at the Animal and Poultry Waste Management Center. Other studies being done by EPA to examine technology include:

- Evaluation of the economic and environmental feasibility of combustion of poultry litter for energy recovery on the Eastern Shore of the Chesapeake Bay. (3/99)
- Poultry waste incinerator pilot project in Maryland. (in process)
- Six-State Animal Waste Consortium (IN, IA, NC, MI, OK, MO) research. Since the proposals are currently being evaluated by a review panel, it is uncertain how many of them may deal with researching affordable technologies. (in process)
- Partial funding of a study in Texas evaluating the feasibility of a centralized manure processing facility for dairy waste. (9/98)

As part of the outreach and education effort that must follow the issuance of these revised regulations, EPA will provide guidance to the livestock producers regarding manure treatment and how to determine the best method for managing their manure to comply with the regulation.

ANIMAL WASTE: REGIONAL MECHANISM FOR MANURE MANAGEMENT

Question. I believe that in certain areas of the country, where livestock production is most concentrated, we need to establish regional mechanisms for treating and distributing manure and fertilizer products. A number of European countries have adopted this kind of approach, and I think it would relieve the burden on individual producers to adopt new treatment technologies and deal with excess manure. Is

EPA taking a solid look at what technologies are being used in Europe and elsewhere in the World that might be adopted in our country?

What is EPA doing to help states and local governments establish regional approaches to manure management and to provide information about some of the advanced technologies that are available? What research is EPA doing in this area?

Answer. EPA has met with representatives of European governments and companies conducting business in Europe and has become familiar with European programs, especially those employed in the Netherlands.

EPA agrees that regional mechanisms will be necessary for some areas to deal with excess manure, and will encourage businesses that attempt to establish these mechanisms. For example, EPA has evaluated the centralized incineration of poultry litter to generate electricity on the Eastern Shore of the Chesapeake Bay.

EPA's Region III, the Agency's representative at the Poultry Dialogue, has worked closely with the poultry industry and businesses interested in providing regional mechanisms for handling excess manure. Region III has worked with the poultry processors to encourage them to take a lead in identifying the technology that best suits their needs and the needs of their growers.

POLLUTION PREVENTION AND THE FEDERAL GOVERNMENT: BIO-BASED EPPS

Question. What has the EPA accomplished in moving forward towards increasing the government's purchase of bio-based EPPs, as required by the Executive Order?

Answer. Under Executive Order 13101, the USDA is responsible for issuing a bio-based products list, and the EPA is responsible for issuing guidance for Federal agencies to use in identifying environmentally preferable products. Bio-based products and environmental preferable are defined differently under the Executive Order. Our objective is to identify areas of overlap that can benefit both efforts.

For example, in developing the guidance on environmentally preferable products, we are identifying rapidly renewable bio-based products in our category of products with positive environmental attributes. In working with NIST on life cycle assessment decision support software, we are evaluating product categories that include bio-based alternatives.

In addition, there are federal pilot projects underway or being planned in 17 product categories. 12 of those categories have bio-based alternatives. They include:

- printing, where the products include soy-based inks and bio-based press cleaners;
- alternative fiber paper, made from annual crops (e.g., kenaf) or agricultural waste (e.g., wheat, rye, or rice straw) which would have been burned;
- degreasers, where aqueous-based solvents serve as alternatives to halogenated solvents in parts washing.

We are actively seeking opportunities to further the federal goals of promoting bio-based products in our environmentally preferable purchasing efforts.

Question. What are the barriers that EPA sees in aggressively implementing Executive Order 13101 and moving the government towards bio-based EPPs?

Answer. The most significant barrier is the lack of infrastructure to support and sustain environmentally preferable purchasing. Our new emphasis on pilots, especially those enlisting traditional voluntary standard setting organizations (like Underwriters Laboratories and the National Sanitation Foundation) to help develop environmental standards, is aimed at building the critical infrastructure at reduced cost to the government.

New EPP tool development contributes to infrastructure, as well. We are developing a series of tools for federal purchasers, including a training program, a database of existing environmental standards, and an assessment tool to incorporate life cycle considerations in procurement decisions (developed by NIST). We are trying to build this program as much as possible upon existing private sector capabilities and expertise.

Competing goals have been an obstacle. Procurement officials have struggled to reconcile environmentally preferable purchasing with the goals of procurement reform and there have been sharp conflicts over trade and environmental concerns. In addition, industry has generally opposed efforts to make environmental impacts of products another factor on which they must compete.

Question. The Committee provided an additional \$1 million for this initiative in the fiscal year 1999 budget. How are those added funds being used?

Answer. The primary use for these funds will be to engage voluntary standard setting organizations in developing environmental standards and in developing tools to train and provide environmental information to federal procurement officials. The funding break out is as follows:

Pilots (\$405K)

The National Technology Transfer and Advancement Act of 1996 obliges the federal government to utilize standards and processes developed by voluntary consensus-based organizations. We are drawing on the private sector's capacity to develop environmental standards, as they have for performance and safety, with this mandate. In particular, we are looking to the traditional standard-setting organizations which operate on voluntary and consensus basis.

We recently published a Federal Register notice soliciting private sector involvement in identifying environmentally preferable products and services. Several organizations, including Underwriters' Laboratories, the National Sanitation Foundation, and ASTM, are very interested in this effort and we anticipate that they will move forward with developing environmental standards for one or more product categories. Although this approach is still in the beginning stages, we have received very positive reception from stakeholders in federal agencies, in congressional offices, and in some environmental organizations.

Tools to reach procurement officials (\$310K)

We are developing tools for procurement officials, to help them understand how to bring environmental factors into purchasing decisions. We are supporting the development and refinement of the National Institute of Standards and Technology (NIST)'s life cycle assessment software which measures the environmental and economic performance of building products. We are also developing a series of tools to help federal purchasers understand the concepts of environmental preferability and to facilitate access to available environmental standards about products from a variety of sources. These tools, which will be accessible through the EPP web-site in May, are anticipated to be integrated into the Federal Acquisition Institute's training for procurement officials.

Outreach (\$235K)

Outreach includes case studies, the EPP Update Newsletter, outreach to federal agencies, and the EPP website.

Coordination (\$50K)

Coordination includes funds for Office of Federal Environmental Executive, and support for the "summit" meeting of state/local/federal green purchasing programs.

RADON STANDARDS: AIR MITIGATION-TECHNICAL ASSISTANCE TO SMALL WATER SYSTEMS IN RURAL AREAS

Question. EPA is moving forward with a drinking water standard for radon which is usually associated with air pollution.

I understand that EPA is looking at a set of standards that may set two different levels depending on whether a water system is also engaged in a mitigation program to reduce radon levels in the air. Clearly, air mitigation is a new area for water systems. I believe they would need considerable technical assistance, particularly for our smaller systems in rural areas.

If EPA moves ahead with such a dual standards system, what kinds of support do you think would be appropriate to provide for smaller water systems? What do you estimate would be an appropriate annual cost of such a federal effort?

Answer. The radon rule will be one of the first to follow the new cost-benefit analysis requirements of the 1996 Amendments to the Safe Drinking Water Act (SDWA) and will be based on an innovative framework designed to provide flexibility in risk reduction. The statute provides for a Maximum Contaminant Level (MCL) as well as an alternative (higher) Maximum Contaminant Level (AMCL) coupled with a multimedia mitigation program to reduce radon in indoor air from soil gas. If EPA promulgates an MCL "more stringent than necessary to reduce the contribution to radon in indoor air from drinking water to a concentration that is equivalent to the national average concentration of radon in outdoor air," SDWA requires the Agency to establish an AMCL. The level of the AMCL is thus linked to the average outdoor radon level.

If an AMCL is established, EPA must publish guidelines for state multimedia radon mitigation programs. States may develop (and submit to EPA for approval) a multimedia mitigation program to mitigate radon levels in indoor air. EPA must approve state multimedia mitigation programs if they are expected to achieve "equal or greater health risk reduction benefits" than compliance with the MCL alone. If EPA approves a state multimedia mitigation program, public water supply systems within the state may comply with the AMCL. If states elect not to develop multimedia mitigation programs, public water systems may develop their own such programs and submit them to EPA for review and approval.

We do not expect that State multimedia mitigation programs will require that water systems be responsible for any more than meeting the AMCL for radon in drinking water. Systems must, however, provide information to their customers (through the Consumer Confidence Reports) regarding whether they are meeting the MCL or the AMCL. Other entities within the state will need to implement programs for the reduction of radon in indoor air which comes from soil gas, as is the case with the current voluntary state radon-in-air reduction programs. We expect that many states will consider and adopt state multimedia mitigation programs, thereby obviating the need for public water systems to consider doing so independently. Until states make decisions regarding whether or not to implement multimedia mitigation programs, and until water systems consider their own options, it is difficult to estimate what kinds of, and how much, support will be appropriate to provide for the needs of smaller water systems. Under any circumstance, however, EPA plans to provide both financial and technical assistance to aid in the implementation of this rule. In addition, states are authorized to use up to 2 percent of their annual Drinking Water State Revolving Fund capitalization grant to provide technical assistance to systems serving 10,000 or fewer people.

RADON STANDARDS: INCREASED COSTS FOR RADON ABATEMENT IN WATER

Question. I am told that there are about 160 deaths associated with radon in water compared to 15,000 to 20,000 from air borne radon. This is according to a 1998 National Academy of Sciences Report.

I am also told that the annualized cost of radon abatement in water is estimated to be about \$24 million nationwide per year on average to meet a 4000 pico-curies per liter standard. It rises to \$100 million at a 1000 pico-curies standard and \$800 million at a 100 pico-curies standard. Is that correct?

Answer. The estimated annual costs of radon abatement mentioned above, are drawn from EPA's Health Risk Reduction and Cost Analysis (HRRCA). The HRRCA was published in the Federal Register in February 1999 as required by the 1996 Amendments to the Safe Drinking Water Act (SDWA). The 4000 pico-curies per liter standard is the standard that will be proposed as the alternative Maximum Contaminant Level (AMCL) and is based on the recommendations contained in the National Academy of Sciences (NAS) report, referred to above. The 1996 SDWA Amendments require that if EPA promulgates a Maximum Contaminant Level (MCL) "more stringent than necessary to reduce the contribution to radon in indoor air from drinking water to a concentration that is equivalent to the national average concentration of radon in outdoor air," the Agency must establish an AMCL. The other two standards listed above reflect a range within which an MCL will most likely be established.

We believe the opportunity to realize equal or greater human health protection at lower cost from reducing radon in indoor air was the principal motivation for the option developed by Congress in the 1996 SDWA Amendments, which provide for the AMCL and multimedia mitigation alternative. We support this approach and will reflect this in the regulation, supporting guidance, and in technical assistance to states and public water systems.

RADON STANDARDS: EFFECT OF RADON RULE

Question. Will the likely radon rule create a situation where we will be forcing water systems and their customers to spend large sums in order to bring the danger of drinking water to a point far below that of breathing regular outdoor air?

Answer. It is likely that the Maximum Contaminant Level (MCL) will create a standard that will result in radon levels from drinking water in indoor air below the national average concentration of radon in outdoor air. To address this possibility, the 1996 Safe Drinking Water Act (SDWA) Amendments require that if EPA promulgates an MCL "more stringent than necessary to reduce the contribution to radon in indoor air from drinking water to a concentration that is equivalent to the national average concentration of radon in outdoor air," the Agency must establish an Alternative Maximum Contaminant Level (AMCL). The level of the AMCL is linked to average outdoor radon levels. The AMCL coupled with a multimedia mitigation program to reduce radon in indoor air from soil gas is designed to provide a less costly alternative for mitigating radon in indoor air while still providing effective public health protection. We support this approach and will encourage states to develop multimedia mitigation programs that will enable the water systems in their states to meet less stringent and more cost effective AMCL. Individual water systems have the option of developing multimedia mitigation programs in the event that states elect not to do so.

RADON STANDARDS: IMPACT OF RADON REDUCTION ON SMALL WATER SYSTEMS

Question. Coming from Iowa, I have a special concern for the impact on small systems. And, for small systems the costs can be very high indeed. While the cost of radon reduction might be \$6 per person in New York, it would be \$20 in Des Moines and \$34 in a system with a couple thousand users. For the smallest systems the costs really escalate further going to well over \$300 per user for systems with fewer than 100 people. And there are a great many systems like that in Iowa.

I know you cannot give a figure for what is the maximum sum that should be spent. But, I want to know if this subcommittee can have your commitment that you will take personal care to establish standards for systems that consider the real economic realities of smaller systems?

Answer. The Administration and EPA are committed to establishing standards that fully consider the real economic realities of small public water systems. We are acutely aware of the fact that, due in large part to poor economies of scale, regulatory costs per household dramatically increase for the smaller public water systems. Among other steps aimed at fully considering the concerns of small public water systems, we convened a panel under the terms of the Small Business Regulatory Enforcement and Fairness Act (SBREFA) in which we specifically discussed and reported on small entity concerns. This report will be a part of the supporting documentation accompanying the proposed rule. This panel process was informed by several meetings that we conducted with approximately 20 representatives of small drinking water utilities from around the country. One specific output of that process will be an identification in the proposed regulation, and supporting guidances, of affordable and simple-to-operate water treatment technologies for small systems.

As mentioned in our response to some of your related questions on the radon provisions of the 1996 Amendments to the Safe Drinking Water Act (SDWA), we also think the most economical and cost-effective means of compliance with this regulation, in general, will be for small systems to meet the higher, alternative Maximum Compliance Level (AMCL).

 QUESTIONS SUBMITTED BY SENATOR BYRD
NO_x SIP CALL: IMBALANCE BETWEEN CONTROL BURDEN AND NONATTAINMENT

Question. On September 24, 1998, the EPA signed the regional nitrogen oxide state implementation plan (NO_x SIP Call) requiring substantial reductions in emissions of nitrogen oxides from various stationary sources in 22 Eastern states. The allocation of the emission reduction burden appears to be inequitable and clearly in conflict with the alleged purpose of the rule, which is to assist downwind states in attaining ozone standards. The burden placed on states like West Virginia is extremely high compared to many of the Northeastern states. Given the fact that the EPA itself has acknowledged that local source controls are more effective at reducing ozone than reductions made at sources hundreds of miles away, how can you justify this clear imbalance between the imposition of the control burden and the need to address remaining nonattainment problems?

Answer. As you may be aware, the United States Court of Appeals for the District of Columbia Circuit has recently issued two opinions that may impact the NO_x SIP Call. On May 14, 1999, the court issued an opinion regarding the ozone and particulate matter air quality standards that EPA revised in July 1997. *American Trucking Associations v. EPA*, Nos. 97-1440, 97-1441 (D.C. Cir.). We disagree with this decision and are recommending that the Department of Justice take all necessary legal steps so that these important public health protections may move forward. On May 24, 1999, the court stayed the September 30, 1999 SIP submittal date for the NO_x SIP call pending further court action. *State of Michigan v. EPA*, No. 98-1497 (D.C. Cir.). We are currently analyzing the impact of these opinions on several of our air quality programs, including the NO_x SIP Call. We hope to have a more complete picture of the impacts in the near future.

By way of background, the EPA worked in partnership with the 37 easternmost States and the District of Columbia, industry representatives, and environmental groups to address ozone transport. From May 1995 to June 1997, the Ozone Transport Assessment Group (OTAG) held meetings to identify and evaluate strategies for reducing long-range transport of ozone and ozone precursors. This planning body was brought together in recognition that ozone is not only a local issue, but must be addressed as a regional problem. This multi-year collaboration resulted in the most comprehensive analysis of ozone transport ever conducted.

The OTAG and EPA modeling analyses indicate that upwind emissions from States such as West Virginia contribute significantly to downwind nonattainment

problems. As a result, upwind emitters contribute to unhealthful levels of ozone. It was EPA's judgment when it issued the NO_x SIP call that upwind States should reduce at least the portion of their emissions for which cost-effective controls are available. Further, it should be recognized that the major urban nonattainment areas have been required to incur control costs for ozone precursors since the early 1970's. These controls have already led to substantial reductions in ozone levels. In addition, EPA has reviewed the status of the northeastern States' efforts to comply with the requirements of the 1990 Clean Air Act Amendments and has found that these States have completed the vast majority of the SIP submission requirements. In cases where those States have not made the required submissions, they are subject to sanctions under the Clean Air Act.

NO_x SIP CALL: ANALYSIS OR STUDIES ON IMPACT OF INDIVIDUAL AIR QUALITY

Question. In the past two years, the EPA has promulgated four major new regulatory requirements and has focused much attention on the electric utility industry to achieve the air quality goals set forth in them. These rules include: (1) a new national ambient air quality standard for ozone; (2) a new national ambient air quality standard for fine particulates (PM 2.5); (3) the NO_x SIP call in 22 Eastern States; and (4) a regional haze rule designed to improve visibility in national parks, forests, and wilderness areas. In addition, the EPA is in the process of finalizing a new rule to reform the existing New Source Review regulatory program affecting existing sources of power generation. The cumulative affects of these actions, if they withstand judicial review, will be to drive up the cost of electricity and force the premature retirement of some existing plants. These policy objectives clearly appear to be in conflict. It is troubling to me that these air quality issues are seemingly being addressed with little regard for the associated economic, energy supply, and national security implications associated with their intended implementation. Has the EPA done any analyses or commissioned any studies to determine how these individual air quality regulations will cumulatively impact specific states of industries and their ability to comply with these regulations?

Answer. As mentioned previously, the United States Court of Appeals for the District of Columbia Circuit has recently issued two opinions that may impact various air quality programs, including some of the ones you mention. The answer that follows does not reflect how these decisions may impact our programs, which we are currently analyzing.

In response to your specific question the EPA has conducted several studies which addressed the rules identified in the question and the electrical power generation sector. These included the Clean Air Power Initiative Study, 1996; the Regulatory Impact Analyses for the Particulate Matter and Ozone National Ambient Air Quality Standards and Proposed Regional Haze Rule, 1997; the Regulatory Impact Analysis for the NO_x SIP call, 1998; and, the Regulatory Impact Analysis for the Final Regional Haze Rule, 1999.

These assessments are designed to look at the incremental effects of separate but related rule makings. The results of these analyses illustrate the complementarity amongst the related rules. Since ozone and particulate matter share some of the same precursor gases, control strategies designed to reduce emissions of these precursors can lower ambient concentrations of both pollutants. Also, because of the interrelationship between these pollutants and their precursors, strategies aimed at meeting the national ambient air quality standards (NAAQS) for both pollutants will also improve visibility at mandatory Federal Class I Areas. For example, the Final Regulatory Impact Analysis for the Regional Haze Rule found that mandatory Federal Class I areas in the Midwest/Northeast and Southeast met or exceeded a variety of illustrative reasonable progress goals through 2018 as a result of strategies targeted at the particulate matter and ozone NAAQS. Hence, although we have issued multiple rules responding to different mandates, the impacts are not necessarily additive.

Although the EPA has not done a cumulative assessment, the aforementioned economic studies do address the energy supply and economic considerations. In fact, the Department of Energy is part of the interagency review process for the Regulatory Impact Analyses. But, there are limits to these as well as cumulative impact studies especially given the discretion the States have in designing State implementation plans, emission management strategies, and reasonable progress goals for Regional Haze. Such caveats are noted in the various Regulatory Impact Analyses.

In addition, EPA has conducted extensive analyses of the impacts of the NO_x SIP call. The Agency assumed only cost-effective and technically feasible NO_x controls when developing the State budgets and supported those assumptions with analyses in the docket. In the Agency's report, *Analyzing Electric Power Generation Under*

the CAAA, EPA investigated the impacts of the control levels assumed in the SIP call on the electric generation sector and found controls of .15 lb/mmBtu were cost-effective (about \$1500/ton). In the Agency's report, *Feasibility of Installing NO_x Control Technologies by May, 2003*, EPA looked specifically at the ability of the electric generation sector to install control technologies in the time frame required by the NO_x SIP call and found that this sector should be able to comply with the regulations. In addition, the Agency examined the impacts of a section 126 rulemaking or a Federal Implementation Plan on small entities as well as municipally-owned entities.

NO_x SIP CALL: NO_x REDUCTIONS COMPLIANCE DEADLINE

Question. The electric utility industry and several states have raised concerns about the ability to comply with very stringent NO_x reduction requirements in a very short time frame without threatening the reliability of electrical supply in the affected and neighboring states. Midwestern electric utilities will have to take many of their facilities offline to install new NO_x controlling technologies under the NO_x SIP Call. This could place additional pressures on the electricity grid because the seasonal window for installing these technologies is limited so as not to disrupt the power supply during high demand periods. Given these limited time frames, the North American Electric Reliability Council is preparing a comprehensive report to assess this issue. If it should determine that the compliance deadline poses a certain threat to the reliability of electricity, will the EPA be willing to extend the compliance deadline to alleviate this problem?

Answer. As mentioned previously, the United States Court of Appeals for the District of Columbia Circuit has recently issued two opinions that may impact various air quality programs, including the NO_x SIP Call. The answer that follows does not reflect how these decisions may impact our programs, which we are currently analyzing.

In response to your particular question the EPA looked thoroughly at the issue of threats to the reliability of electricity in developing the NO_x SIP Call compliance dates and found that reliability problems should not emerge. See *Feasibility of Installing NO_x Control Technologies by May, 2003*, EPA, September 1998. However, in response to concerns about the potential effects of the rule on the availability of electricity, the final rule creates an additional pool of emission credits for each State to use. States may issue the emissions credits to sources that achieve their emission reductions earlier than required or to sources that demonstrate a need for relief from the compliance deadline.

The North American Electric Reliability Council (NERC) raised the NO_x SIP Call as a concern for the future in its 10-Year Reliability Assessment report last fall in the executive summary. Two other studies, one by a section of NERC, the MAIN region, and a second by M.J. Bradley and Associates, did not find that the SIP call would cause a reliability problem.

The Ozone Transport Assessment Group (OTAG) that worked together for two years to address the ozone transport issue was a partnership of the 37 easternmost States, the District of Columbia, EPA, environmental groups, and industry representatives, including the utilities industry. EPA has worked with the utilities industry in this and other capacities and will continue to work with utilities to develop and implement cost-effective pollution controls without compromising the industry's ability to provide service to its customers.

EXECUTIVE OFFICE OF THE PRESIDENT
COUNCIL ON ENVIRONMENTAL QUALITY AND OFFICE OF
ENVIRONMENTAL QUALITY

STATEMENT OF GEORGE T. FRAMPTON, JR., ACTING CHAIR

Senator BOND. In order to accommodate Senator Craig, we will now call Mr. Frampton up and ask him to begin with a—if you would a summary of your opening statement as briefly as possible and we will then turn to Senator Craig. We welcome you to the committee.

We are in the home stretch. Mr. Frampton, welcome before this committee.

Mr. FRAMPTON. Mr. Chairman, thank you for the opportunity to appear before you and to present the President's proposed budget on environmental quality. Since I have not worked with this subcommittee in my 4 years with the Interior Department, I've tried to get around to see each person personally before this hearing. I did not succeed in this but I hope to be able to succeed in doing that in the coming week, those members I did not get to see before.

I have submitted a written statement. You have our budget justification. Since I know that you and Senator Craig want to get to questions, let me just take a minute to summarize. We are asking for an increase for fiscal year 2000 of \$345,000 for a total amount of \$3,020,000. It is the same we asked for last year and the year before.

The principal need that I see, as the new acting chair here since November, is to have a few more staff people to work on issues that relate to building partnerships between Federal agencies and stakeholders and partnerships between Federal agencies and State and local governments not only in the administration of environmental impact statements and reviews, but in just seeing that the Federal family speaks with one voice and works with State and local government. Two examples, Mr. Chairman, and then I will conclude.

There was some discussion this morning about the Food Quality Protection Act. That is an example of a situation in which Congress passed really a landmark statute. Tremendous opportunity is there to improve health. But after it passed, people realized what some of the ramifications were for manufacturers and for people who grow the produce. And CEQ was instrumental in making sure that EPA and the U.S. Department of Agriculture could get together and create a process that would give the folks who were regulated and who would grow the products some sense that it would be based on science and it would be rational.

I am sorry that last week some of the environmental folks walked away. I think we are going to go ahead and do this right

and I think CEQ is a part of that. I hope we will be successful in the future and I hope those people come back.

The second example is last fall the Governors of Oregon, Washington, California and Alaska wrote to the Vice President asking that the Government set up a coastal salmon fund, the money going directly to the Governors and the Tribes to help them deal with salmon restoration challenges. There is a proposal in the President's budget fiscal year 2000 to do that. They asked that we make sure that the money got to the Governors with a minimum of paperwork and rules but that there was a system for accountability.

PREPARED STATEMENT

These are the kinds of issues that I think CEQ is uniquely well positioned to work on. It is for these kinds of programs that we are asking for a budget increase. With that, Mr. Chairman, I hope to answer any questions.

[The statement follows:]

PREPARED STATEMENT OF GEORGE T. FRAMPTON, JR.

Mr. Chairman, Senator Mikulski, members of the Subcommittee: I am pleased to appear before you today to testify on behalf of President Clinton's fiscal year 2000 budget request for the Council on Environmental Quality (CEQ) and the Office of Environmental Quality (OEQ) (hereinafter collectively referred to as CEQ). The President's request is the same as in fiscal year 1999—\$3,020,000 and 23 Full Time Equivalent (FTE) staff positions, an increase of \$345,000 over CEQ's enacted fiscal year 1999 budget. The increased budget request reflects the President's ongoing commitment to a CEQ that fully satisfies its statutory obligations under the National Environmental Policy Act (NEPA).

Before outlining for you some of CEQ's major accomplishments this past year, and our objectives for the coming year, I would like briefly to describe our agency, the role it plays in the Federal family, and how we have defined our mission under the leadership of President Clinton.

CEQ was created by the Congress in 1969 with strong bipartisan support amid growing concern about the state of our environment. NEPA, the statute that established CEQ and defined its goals and responsibilities, is truly a landmark law. It declares it to be the policy of the Federal government "to use all practicable means and measures * * * to create and maintain the conditions under which man and nature coexist in productive harmony, and fulfill the social, economic, and other requirements of present and future generations of Americans." CEQ strives to serve those ends in a number of ways. The agency advises and assists the President in developing environmental policies and legislation; assesses and reports on trends in environmental quality and recommends appropriate response strategies; coordinates the environmental activities of all federal agencies and departments; fosters cooperation among federal, state and local governments, the private sector and the public; oversees agency implementation of the environmental impact assessment process; and mediates disputes regarding the adequacy of such assessments and the policy judgments inherent in them.

This is an ambitious portfolio for a small agency, and one of utmost importance to our Nation. Twenty-nine years after Congress so wisely sought fully to integrate environmental concerns into federal decision making; our challenges have grown only more daunting, and the need for innovative solutions all the more imperative. Our actions are guided by three core principles. First—and this is clear in the very words of our authorizing statute—our goal is not to balance the environment and the economy as if they are competing interests, but rather to demonstrate their fundamental interconnection. The choice between the economy and the environment is a false one. The economy and the environment can and must go hand in hand. Second, we must move beyond the chronic conflict that too often characterizes environmental decision making and forge collaborative approaches that meet our common needs. And third, we must devise innovative, common sense solutions that achieve the greatest protection for our environment while minimizing the burden on taxpayers and the regulated community.

I am pleased to report that CEQ has made great strides in advancing these principles, both as we carry out our day-to-day responsibilities and through focused efforts to reshape federal environmental programs.

CEQ is working to reinvent the way government goes about protecting our environment. For instance, CEQ has helped forge public-private partnerships to protect water quality through incentives to landowners and to produce the cutting-edge technology that will triple the fuel efficiency of the American car. We are encouraging collaborative efforts to protect habitat before species become endangered and to avoid future flood damage by offering communities a range of options in preparing for and responding to floods. We are promoting job creation through support for the \$180 billion-a-year environmental technology industry. We are working with federal agencies to streamline regulations and environmental reviews, saving precious time and taxpayer dollars. And we helped formulate the Administration's climate change policy, which would harness market forces to achieve cost-effective reductions in greenhouse gas emissions.

CEQ is working to break gridlock and resolve longstanding disputes. For instance, CEQ intervened to resolve a ten-year impasse among federal resource agencies, state environmental agencies, and a local development agency concerning the development of a Special Area Management Plan for the Hackensack Meadowlands in Northern New Jersey. We are hoping to conclude this process, and to develop a better model for comprehensive wetlands planning that provides certainty to the regulated community and closer partnership with state regulators, while enhancing environmental protection.

CEQ is working to formulate comprehensive policy and coordinate the environmental actions of all federal agencies. For instance, CEQ coordinated land acquisition strategy with regard to the Everglades restoration, including closing on the transaction involving the Talisman tract in the Everglades Agricultural Area; helped to develop the Administration's initiative to reduce environmental health and safety risks to children; and oversees a series of initiatives to harmonize our environmental policies as they affect America's farmers and ranchers.

CEQ provides an institutional avenue to address special needs and concerns that cannot be addressed in a timely manner without the discipline and focus that CEQ can bring to the process. Recently, Representative Lowey asked to expedite an inter-agency process because the opportunity to dredge Mamaroneck harbor would have been lost if decisions had been delayed past the first of the year. Just last week, we helped Governor Vilsack resolve disputes among Federal and State agencies concerning permits for the urgently needed closing of agriculture drainage wells in Iowa.

Finally, CEQ is working to restore and preserve precious environmental values for future generations of Americans. Over the past year, we have played a critical role in efforts to protect Yellowstone, the Everglades, and our oceans.

In fiscal year 1999 CEQ has an approved level of 23 FTE positions. This staffing level is below the total allowed by the fiscal year 1993 enacted level, which itself was less than half the historic peak for the agency. I believe the fiscal year 2000 budget request will permit CEQ to fulfill its statutory requirements and make continued progress toward the goal of common sense, cost-effective environmental protection.

PARTNERSHIP PROGRAM

In the fiscal year 2000 budget request, CEQ is proposing additional funding to enhance its ability to assist federal departments and agencies in responding to requests from states, metropolitan and local governments, and businesses for partnership opportunities. For example, the Administration's fiscal year 2000 budget proposes funding:

- to promote smart growth, where local governments have already developed plans and are seeking federal partners;
- to protect open space including greenways in urban, suburban, and near-urban areas;
- to promote the retention of agricultural land near expanding residential areas in traditional agricultural use;
- to protect sensitive habitat in the context of metropolitan, regional, and ecosystem planning; and
- to clean up and restore bays, estuaries, and rivers.

These programs pose new partnership opportunities, but additional potential challenges for CEQ.

The President's budget proposals provide the resources that state and local governments and community leaders need to advance local and regional initiatives for

environmental protection in partnership with the Federal government. Building more effective partnerships increases the need for the leadership and discipline CEQ can bring to issues that involve numerous agencies with very different missions. This is illustrated by our involvement in our ongoing major partnerships which include the following: the Natural Communities Conservation Planning process in which Orange, San Diego, and Riverside Counties in southern California are doing comprehensive planning with cities, real estate developers, environmentalists, businesses and scientists and the federal government to avoid future Endangered Species Act and Clean Water Act mandates; Everglades Restoration; the use of Habitat Conservation Plans (HCPs) with timber companies in the Southeast and Northwest; restoration of the San Francisco Bay-Delta (CALFED); a recent Utah land purchase; and the protection of Sterling Forest in New York and New Jersey.

We believe that there are additional opportunities for more effective partnership. This new partnership approach could foster many additional opportunities. For example:

The Governors of California, Oregon, Washington and Alaska and the tribes have asked for new federal funding for coastal salmon restoration plans to be developed and implemented by the States, and have also asked for federal coordination by the Acting Chair of CEQ to ensure that the federal agencies are working together in a partnership with the state on these important plans. The Executive of King County and the mayors of Seattle and other cities around Puget Sound have asked for a similar effort to assist their MetroSmart Growth Initiative in a way that also helps them and major businesses in the area recover salmon as well as preserve open space and plan urban and suburban densities.

In northern New England, bipartisan legislation has been introduced seeking federal funding, technical assistance, and coordination to allow the states (and non-profits) to purchase easements protecting the working forests from development and pollution. This legislation would advance the overall goal of preserving the quality of rivers, the working forests, timber-dependent communities, open spaces, and access to recreation for millions of Americans—not only those of the region but those within a day's drive of these vast forests.

As issues of watershed degradation, loss of open space and agricultural land, and sprawl attract the attention of more Americans as a premiere “quality of life” issue, urban metropolitan and state governments which bear the principal responsibility for addressing these issues are seeking federal funding, federal technical assistance, and limited strategic use of federal mandates to make their jobs easier (or, in some cases, remove federal barriers to solutions).

Only CEQ in many cases can provide the coordinated federal agency response that is helpful in forging these partnerships. No single individual at CEQ is tasked to respond to these initiatives. We believe that a program allowing us to devote a senior staff member to undertake such efforts will pay countless dividends to state and local government and their business and environmental partners.

ACCOMPLISHMENTS OF THE COUNCIL ON ENVIRONMENTAL QUALITY

Over the past year we have endeavored to live up to the promise of NEPA—exercising fully our responsibility to coordinate policy and resolve disputes, advancing a new way of doing business, promoting consensus-based decisions, providing advice and guidance, responding to emergencies and resolving interagency disputes as early as possible, thus avoiding the need for more formal, time-consuming processes. We also have worked very hard to respond to matters raised by the Congress last year. This portion of my testimony will report on some of our achievements during the past year and on some projects that we hope to accomplish in the coming year.

STATUTORY INTEGRATION

CEQ is identifying sites for pilot projects that integrate compliance requirements under a range of statutory authorities and programs. The purpose of this effort is to develop local, on-the-ground models of comprehensive environmental planning that build on the objectives and principles explored by the Center for Strategic and International Studies (CSIS), the National Academy of Public Administration, the Keystone Center, and others (see *The Environmental System in Transition: Final Report of the Enterprise for the Environment* (CSIS 1998)). Ideally, these models would provide more effective resource protection strategies while offering greater certainty and flexibility to the regulated community. In many cases, initial planning done under the Endangered Species Act, particularly for HCPs, can be the building block or the model for more comprehensive strategies that employ a “no surprises” approach incorporating a broader array of statutory requirements. The following examples suggest promising areas for this approach.

Pacific Northwest.—Successful coordination among Federal, state, and tribal resource agencies to respond to threatened and endangered salmon has established framework for regional coordination under the Endangered Species Act and the Clean Water Act. An integrated approach would expand this model to integrate remedial work under Superfund and the Natural Resource Damage programs and offer expedited resolution of compliance and restoration issues for responsible parties.

Southern California.—Dairy producers in the Santa Ana Watershed have asked for CEQ's assistance in integrating agricultural and clean water requirements in the area. Residents in Irvine and Newport, California, have asked for CEQ's assistance in expanding their Natural Communities Conservation Plans (HCPs in Orange County and San Diego County) under the Endangered Species Act (administered by the Department of the Interior and the National Oceanic and Atmospheric Administration) to incorporate a comprehensive wetlands management plan under the Clean Water Act (administered by the Army Corps of Engineers and the Environmental Protection Agency (EPA)).

DISPUTE RESOLUTION

CEQ is a mediator between agencies and our efforts often prevent stalemates and litigation.

The U.S. Institute for Environmental Dispute Resolution, established by Congress in 1998, is open for business in fiscal year 1999. The Institute is authorized to resolve environmental disputes among federal agencies or between a federal agency and a non-federal party, as well as offering training and other services associated with alternative dispute resolution. Congress placed the Institute under the auspices of the Morris K. Udall Foundation, which was established in 1992 as an independent agency of the Executive branch and is governed by a Presidentially-appointed, Senate confirmed board. Because the Institute's role is linked to the NEPA and CEQ's role in interagency dispute resolution, Congress made CEQ an ex officio member of the Udall Foundation Board when it created the Institute. In that role, CEQ has been helping to advise the leadership of the Institute as it establishes its program. In addition, under the authorizing legislation, CEQ must concur in federal interagency disputes being referred to the Institute.

CEQ worked with the Idaho Congressional Delegation to ensure that the Air Force and the Bureau of Land Management worked together to provide a streamlined and efficient NEPA analysis upon which to base a decision on the Idaho Bombing Range. Further, CEQ worked with the Congressional delegation to provide sufficient mitigation measures to ensure the habitat for the bighorn sheep and other sensitive species was preserved.

A large number of the nation's hydropower facilities will be under consideration for relicensing by the Federal Energy Regulatory Commission (FERC) in the near future. These relicensing processes involve consideration of a number of environmental issues within the expertise and jurisdiction of a variety of Executive Branch agencies including the Departments of Agriculture (USDA), Commerce, Interior and the EPA. CEQ is working with a team of all agencies involved in the relicensing process including the FERC to ensure consistency and efficiency of consideration of environmental issues during the relicensing process.

CEQ has worked with the Departments of Defense, Transportation, and the EPA, and interested Members of Congress to address serious public health, environmental, and worker safety concerns that have been raised in connection with export of surplus vessels for scrapping by overseas scrapping yards. This work culminated in an Administration decision (September 23, 1998) to extend for one year an initial moratorium on overseas ship-scrapping while agencies work to identify opportunities to scrap surplus vessels under appropriate safeguards in U.S. yards. CEQ will continue to oversee implementation of the directive as well as to decide any requests for exceptions.

CEQ managed an interagency team including the Federal Aviation Administration, Department of Interior, National Park Service and Department of Transportation to craft a solution to the contentious issue of parks overflights. This effort culminated in issuance of final rules governing overflights in Grand Canyon and Rocky Mountain National Parks published on October 31, 1997, which balanced the needs of aircraft operators with those who prefer maximizing quiet in those parks. Administration work continues on additional aspects of the Grand Canyon issue including drafting of new flight corridors. In addition, CEQ coordinates the ongoing work on a national rule to provide general guidance to those grappling with these issues in other parks, as well as to interagency efforts to ensure that any regulation of overflights deemed necessary is streamlined, efficient, and fair to all concerned.

An advisory group of stakeholders established as part of this interagency effort to assist the agencies has produced a template for this rule that also has been a model for legislative initiatives to address this issue.

POLICY COORDINATION

As mandated by the National Environmental Policy Act, CEQ's role is to advise the President on environmental policy matters and coordinate activities of the federal agencies and departments with regard to environmental matters that cross agency jurisdictional lines. In the past year, CEQ has played a role in the development and coordination of policies that have more effectively integrated environmental, economic, and social objectives into federal decision making. Outlined below are a few recent efforts undertaken by CEQ.

CEQ has coordinated the federal response to the environmental threat and public health concerns associated with *Pfiesteria piscicidia*, the organism linked to massive fish kills in Maryland, North Carolina, and Virginia. After *pfiesteria* outbreaks resulted in closure of several Chesapeake Bay tributaries in the summer in 1997, CEQ organized the work of federal agencies to provide affected states with needed federal support, ensuring that federal resources were deployed effectively and wisely. CEQ has been monitoring the work of involved federal agencies through regular meetings to develop a coordinated research strategy and to ensure that other steps are closely coordinated and responsive to the states. CEQ also worked directly with Congressional offices to arrange briefings for the delegations of affected states to keep Members fully informed concerning the Administration's efforts. On August 6, 1998, Chief of Staff Erskine Bowles announced targeted support for North Carolina in response to a significant *pfiesteria* outbreak in the Neuse River. CEQ coordinated this response.

CEQ continues its work with EPA and USDA, the co-chairs of the Clean Water Action Plan announced by President Clinton on February 19, 1998, to coordinate the efforts of all of the federal agencies in addressing the second generation of water quality protection under the Clean Water Act. Through the Action Plan, CEQ is developing and supporting a series of locally-led water quality initiatives, beginning with the Administration's Seacoast Estuary initiative in New Hampshire, which will cut in half the time required to reopen shellfish beds that have been closed by polluted runoff.

CEQ has overseen a series of initiatives to harmonize our environmental policies as they affect America's farmers and ranchers. CEQ has worked with USDA to focus conservation programs on environmental goals. CEQ developed the Administration's process for ensuring that agricultural groups and other affected constituencies are effectively heard as EPA implements tougher public health protections under the Food Quality Protection Act. CEQ is coordinating the work of the White House Wetlands working group on a new policy for wetlands delineation on agricultural lands, so that farmers and ranchers, to the extent the law permits, will get reliable wetlands guidance from one agency. Working with USDA and interested states, CEQ has accelerated development of Conservation Reserve Enhancement Program agreements, such as those announced recently in Oregon and Washington, which deliver more than \$200 million in new support in each state for farmers acting to protect critical habitat and water quality.

CEQ has initiated a dialogue among academics, citizen groups, and interested Federal agencies concerning the erosion of citizen access to courts to enforce environmental laws, particularly with respect to community right-to-know about toxic releases. We expect that this dialogue will help shape legislative proposals that could be considered as freestanding legislation or in the context of major statutory reauthorizations.

To celebrate the U.N. Year of the Ocean, the Administration held a National Oceans Conference in Monterey, California in June, 1998. The conference, co-chaired by the Department of Commerce and the Department of Navy, involved departments and agencies that manage programs affecting the oceans, a vital natural resource. CEQ is monitoring progress toward implementing those proposals.

Working with the Domestic Policy Council, other White House offices, and affected agencies, CEQ helped to develop President Clinton's initiative to reduce environmental health and safety risks to children. A Presidential Executive Order, which was announced on April 21, 1997, requires federal agencies to assign high priority to addressing these risks, to strengthen policies to protect children, to coordinate agency research focused on children's health, and, as suggested by the report of the National Academy of Sciences, to ensure that agency standards take into account special risks to children. The Administration's fiscal year 2000 contains an expanded effort to achieve these objectives.

The Administration's effort to restore the Everglades made significant progress in 1998. The Army Corps of Engineers released the draft "restudy" of the Everglades ecosystem and went through an extensive public comment period. CEQ coordinated land acquisition strategy, including closing on the transaction involving the Talisman tract in the Everglades Agricultural Area. CEQ continued to help resolve inter-agency disputes involving Everglades restoration including the issues involved in the preparation of the Supplemental Environmental Impact Analysis on the redevelopment of Homestead Air Force Base and measures needed to ensure the protection of the Cape Sable Seaside Sparrow.

A NEW WAY OF DOING BUSINESS

The Clinton Administration is committed to reinventing the way government operates so that it works better and costs less. CEQ continues to take the lead in reinventing federal environment policy by encouraging approaches that work to reduce burdens, break gridlock, provide incentives, and build partnerships with state and local government and the private sector. Below are some examples of how CEQ accomplishes this task.

The introduction and spread of invasive species in the United States is a major ecological and economic problem for diverse environments and economies in the United States. Invasive species are generally considered to be the second biggest threat to native wildlife (following habitat destruction). Approximately \$5 billion per year are spent by ranchers and farmers in this country for noxious weed control, and indirect costs in losses to crop and rangeland productivity are estimated at about \$7.4 billion per year. Utilities spent \$3.1 billion over the last ten years to control invasive species.

To address this difficult problem in a coordinated, systematic manner, the President recently issued an Executive Order on invasive species. The Order establishes an interagency council to coordinate federal efforts to address this problem, as well as an advisory committee to involve state, tribal and local governments, scientists, commercial interests, conservation organizations and academic institutions in developing and implementing solutions.

CEQ has worked with EPA, the Chemical Manufacturers Association, and the American Petroleum Institute on a challenge to industry to produce basic public health data on the 3000 chemicals now in high-volume use in the United States. Under a voluntary agreement announced on October 14, 1998, U.S. chemical firms have agreed to a schedule to produce all of this data and to make the data available to the public. CEQ is working to support the domestic effort by ensuring continued Administration pressure on overseas firms and governments to contribute their fair share to the testing effort.

CEQ initiated and is overseeing an ongoing process to develop administrative reforms to guide programs for restoring natural resources and recovering damages for the costs of such restoration. This process is a response to concerns among natural resource trustees about the extent to which federal and state cleanup programs take natural resource issues into account and strong concern in the business community that natural resource trustees might require cleanup measures that would be inconsistent with remedial steps required by EPA and state response agencies responsible for toxic waste cleanup.

As part of President Clinton's initiatives for reforming environmental regulation, CEQ coordinated the development of bipartisan alternative compliance legislation to provide greater regulatory flexibility to firms that can achieve superior environmental results at reduced cost. This bill, introduced in the Senate by Senator Lieberman and in the House by a bipartisan coalition of Members, builds on the success of EPA's Project XL program, enabling EPA to overcome statutory impediments to greater program flexibility. CEQ will coordinate the Administration's work in advancing this or similar proposals and is currently working with Members of Congress who have been developing new alternative compliance proposals as the basis of bipartisan legislation in the 106th Congress.

The President's Council on Sustainable Development (PCSD) is a federal advisory committee that includes members of the President's cabinet, corporate CEOs, national environmental leaders, local officials, and representatives of other interests. CEQ is the lead agency coordinating the work of the PCSD. In March 1996, the PCSD produced a report entitled, "Sustainable America; A New Consensus for Prosperity, Opportunity, and a Healthy Environment." Since 1996, the PCSD has continued to work to implement recommendations in "Sustainable America," as well as developing new policy recommendations for the Administration. The PCSD is also the sponsor of the "National Town Meeting for a Sustainable America." This event will occur from May 2 to May 5, 1999. The hub event will be in Detroit, Michigan, with

concurrent events to be held simultaneously in communities across the nation. The National Town Meeting will serve as a means to foster and promote innovative practices in business, in government, and in communities that can help harmonize our nation's economic, social, and environmental goals.

Among the recommendations contained in the PCSD's "Sustainable America" report, are policies to build more sustainable communities, including recommendations concerning "collaborative regional planning." These recommendations reflect a growing concern across the nation about the traffic congestion, loss of open space, and reduction of quality of life that can result from sprawl development. They also respond to growing interest in encouraging greater cooperation among cities, suburbs, and surrounding rural areas within a region to address transportation and land use issues that cross local jurisdictional boundaries. These issues will remain a high priority at CEQ in the year ahead.

NEPA REINVENTION

One of the overarching goals of CEQ is to achieve higher levels of environmental protection with lower costs and less red tape. CEQ has made important strides in improving the way NEPA operates in its day-to-day administration. Improving NEPA implementation fundamentally is the purpose of the NEPA Reinvention Project, a multi-phased effort aimed at the NEPA process across all federal agencies. CEQ was given a small increase in fiscal year 1999 appropriations to build on our work to reinvent NEPA through this project. However, a statutory restriction in the CEQ appropriations bill continued a prohibition on the use of agency detailees by CEQ, preventing CEQ from using a detailee to support NEPA reinvention work in fiscal year 1999 as CEQ had in fiscal year 1997.

Last year, CEQ was able to make notable progress in our efforts to reinvent NEPA. For example:

CEQ has been working with the Army throughout the year to provide advice and assistance in streamlining its NEPA regulation. We expect in the coming year the Army will issue a draft regulation for public comment.

CEQ has been working with the Department of Energy throughout the last year in its efforts with NEPA reinvention by participating in a symposium hosted by the National Association of Public Administrators. A final report was issued by NAPA on further actions DOE should take to make their regulations more efficient and effective.

CEQ has been working with the National Oceanic and Atmospheric Administration (NOAA) to streamline the NEPA process that is part of the national marine sanctuaries' management plan revision process. The majority of the nation's twelve national marine sanctuaries will be revising their management plans within the next few years, and CEQ has worked with the sanctuary managers and NOAA headquarters to establish a blueprint for moving forward with revisions in an organized, efficient and timely manner.

In energy policy, CEQ has started to work with the appropriate agencies to expedite review of natural gas pipeline projects and has also supported the Federal Energy Regulatory Commission's recent proposal to eliminate ex parte requirements for purposes for the environmental impact assessment process.

Mr. Chairman, Senator Mikulski and members of the Subcommittee, as the Acting Chair of CEQ, I am committed to continue the work that our agency was chartered to do 29 years ago. CEQ plays an important role in making sure that the federal family speaks with one voice on environmental issues. With the modest additional resources that we have requested, we can fulfill this role with an even greater effectiveness. I look forward to working with you in the coming year.

Thank you for the opportunity to appear before the Subcommittee. I am happy to answer any questions you might have.

Senator BOND. Thank you very much, Mr. Frampton. Senator Craig.

CEQ RESPONSIBILITY

Senator CRAIG. Thank you very much, Mr. Chairman.

George, it is good to have you before the committee and I hope we can reschedule the meeting. We were not able to get together today. I have got several areas I would want to visit you about.

I guess the value of the length of time we spent with Carol gave me time to read your testimony because I had not had that oppor-

tunity yet. Let me suggest one thing to you, which is my first impression of it, and I know a first impression is not the best approach. I am a bit astonished at the broadened, wide range of responsibility that you suggest CEQ ought to have or does have. I say that because I always felt, as many do, that some of these problems we have can best be solved at a more local level, and I am not sure that CEQ is headed in that direction.

FISH MITIGATION PROCESS

For instance, you cite on Page 5 of your testimony that you have successfully coordinated or are successfully coordinating among Federal, State and Tribal resource agencies to respond to threatened and endangered species of salmon in the Northwest. That is something I am spending much time on in the West and in the Northwest. Quite honestly, I am not aware of any successful coordination yet. I am very aware of struggling, power struggles, lawsuits and a region that now feels very, very threatened by the potential impact of decisions made by Federal agencies as it relates to a fish mitigation process.

And I suggest to you that there is not yet time to take credit for having solved a problem that is still in the phases of being designated. And tragically the lines are still getting drawn out there as to how big the battle is going to be over this issue. That is a tragedy. That is my first reaction.

DIFFERENT PURPOSES

Let me also suggest, you conclude in your testimony that CEQ plays an important role in making sure—you mention the Federal family speaks with one voice and you cite. I want the right hand and the left hand of Government to know what they are doing. Let me suggest to you, and you know it, that U.S. Fish and Wildlife Service is required to protect and enhance fisheries throughout the country. FERC is required to balance that interest with the need for power development. And my guess is those are two very different roles. And I am not sure that FERC speaks of coordinating actively with Fish and Wildlife Service. There are different purposes. Isn't there a natural relationship that agencies must have, some degree of understanding? That is another concern.

So I guess the question is if CEQ's job is to oversee the balancing work of FERC and if that is the case, who is in charge? And the same thing would be with U.S. Fish and Wildlife Service.

I have grown to be very concerned that CEQ gets into micromanaging decision making that goes on in other agencies simply because of where it rests in the hierarchy of any administration and sometimes that becomes a political decision and not a decision based on good science. It is the politics of the administration or of the day, instead of the right decision coming out of the process of long term working it through the laws of these different agencies.

I would tell you that not on my watch will CEQ become the super agency of managing the Federal Government. I don't think that was our intent. And if that is where it appears to be headed, then it will be my intent to work with the Chairman to make sure that doesn't happen.

I want you to have tools but I do not want you to have the power to cram it down Interior or U.S. Fish and Wildlife or FERC's throat that which they, by law, by policy of the Congress and Government have the right to do.

I guess that is my question and my concern, George.

Senator BOND. What was the question?

Senator CRAIG. It is a multiple.

Mr. FRAMPTON. Let me try to put a question together and—

Senator CRAIG. First of all, are you planning to become a super agency?

Mr. FRAMPTON. No. I think it is—you asked me for a personal response and I gave that. After 4 years at the Interior Department, which was a very good preparation for coming to CEQ because I have seen this from an agency perspective. And I have no desire to either run or micro-manage agencies. In fact, to the contrary. I have said for the last few months and keep saying to my own staff and others from the agencies and the White House, we are here to help the agencies do their job and make them work together and solve discontinuities and help them work with State and local governments. We are not here to run their programs. So that is a strong philosophy that I have, to push things back to the agencies where they belong.

On the salmon issue, I did not intend in my testimony to take credit for any great coordination to be achieved, only to identify a great challenge. I agree with you, there are terrible problems, lots of agencies, Tribes and States. But CEQ was created in some part by Congress in 1969 as a place free of what commentators have called agency bias, commitment to a particular regulatory scheme or a particular agency mission, to try to harmonize different agency objectives and also to balance them with social and economic considerations.

So I think there is an important role for CEQ. But it is the role of a mediator and a catalyzer, not the role of a czar.

Senator CRAIG. Thank you. Mr. Chairman, thank you for the courtesy.

Senator BOND. Thank you very much, Senator Craig.

SUPERFUND

Mr. Frampton, I am interested in discussing Superfund. What you said yesterday, we are looking at introducing a limited Superfund bill. But is it not time to begin to ramp down the program? Are we reaching the conclusion on Superfund?

Mr. FRAMPTON. Senator, it is certainly a mature program. The point that I made to the Environment and Public Works Committee yesterday was that perhaps unlike 6 years ago, cleanup has been accelerated. Most of the fundamental cleanup, at that time, decisions have been made. And while the administration has been very committed to work toward comprehensive reform over the last several years, perhaps we need to work on a few things to speed it up. I think that the program is naturally ramping down but the administration does support obviously, the reauthorization of the Superfund Act because without that the program, we will go off the boat ramp into the water pretty quickly.

Senator BOND. But we are moving to the point where we are cleaning up the most significant ones. So there is less of an urgency for any new resources in it.

Mr. FRAMPTON. I think there is a need for 5 or 6 more years of significant resources but we are looking toward a time around 2005 when a very substantial amount of the site construction will be completed.

CEQ'S COORDINATION ROLE

Senator BOND. You mentioned in your discussions earlier, in your testimony that you coordinated activities in the Federal Government. Do you see areas where you can assist in coordinating with our partners? We have talked a lot about devolution of environmental responsibilities to State and local entities. What role do you see CEQ playing? And do you have any specifics on where you may be heading in working with Governors or others to devolve additional environmental responsibilities to State and local governments where it could be more expeditiously handled and where the results might be quicker?

Mr. FRAMPTON. I think the coastal salmon fund that I mentioned is to provide resources—to have the Federal Government to rely on those States to do their own salmon recovery plan. I think there are a number of new initiatives in the President's proposed budget for this year which try to respond to the philosophy that we cannot do everything by regulation, and put some resources on the ground.

Administrator Browner talked about Better America Bonds, whether it is wetland protection or urban recreation, to try to put the money and decision making in local government. The same thing is true of the Clean Air Fund that is proposed in EPA's budget.

BETTER AMERICA BOND

Senator BOND. Let me assure you that we do not have the money for those new priorities when we are talking about devolving those responsibilities.

You have heard many comments on the Clean Water SRFs. We are going to fund that before we fund any of those new things. And, frankly, when you look at the Build a Better America, that bonding activity to get EPA into local land use management, you are going to have to convince a lot of people who will have to vote to overcome my objection before you ever see that one see the light of day. When we are talking about devolving responsibilities, this is not a year where we are going to find new dollars.

Mr. FRAMPTON. I understand what you are saying. Just to respond to the Better America Bond issue for a second. The proposal here uses EPA as the conduit because the purpose is for, among other things, clean water and brownfields and people working those fields, but it is going to be an interagency program. EPA is simply a conduit.

Number two, there is nothing in that proposal for the new tax-exempt bond system that involves EPA or any Federal agency in any way in any land-use decisions. All the initiatives to propose bond issues to use the money that comes in will be with State, local and county governments.

Senator BOND. And my State has developed an 8-percent sales tax for conservation needs. I think that is the appropriate way. It enables the State, in this instance, to be the conservation agency to implement. We have land and water conservation funds and I think this Build a Better America bond is—has not too rosy a future. I would not spend a lot of time devoting energies to how that is going to be implemented.

Mr. Frampton, I thank you for your testimony. For the record, I am going to add—do you have any further questions?

Mr. FRAMPTON. No, Mr. Chairman.

CHEMICAL SAFETY BOARD

Senator BOND. I am going to add a brief statement about the Chemical Safety Board which is subject to the jurisdiction of this committee. Concerns have been raised by the operations of the board and based on the questions we asked, the General Accounting Office is to do a formal review of the board. GAO is presented in testimony.

The General Accounting Office has identified significant problems with the timeliness and with inappropriate resource allocation, including the fact that there are as many external affairs personnel as there are investigators. About two-thirds of the board's contract dollars is not related to investigation.

And the board has had problems managing its contracts because it has no formal written procedures for staff to follow in awarding and managing contracts. Ineffective use of resources resulted in an announcement recently not to begin any new investigations this fiscal year, but the year is only half over.

[The information follows:]

[The General Accounting Office, April 29, 1999]

CHEMICAL SAFETY BOARD: STATUS OF IMPLEMENTATION EFFORTS

(By David G. Wood)

Mr. Chairman and Members of the Subcommittee: We appreciate this opportunity to provide a statement for the record for use in the Subcommittee's hearing on the fiscal year 2000 budget request for the Chemical Safety and Hazard Investigation Board (the Board). The Board recommends steps to enhance industrial safety based on its investigations of accidental release of toxic and hazardous chemicals and its other activities. The Board was funded at \$4 million in fiscal year 1998, its first year of operation, and \$6.5 million in fiscal year 1999. The Board is required to submit its budget request concurrently to the Office of Management and Budget (OMB) and the Congress. For fiscal year 2000, the Board has requested \$12.5 million while the President's budget, after OMB's review, has requested \$7.5 million for the Board.

You expressed concern that the new organization's operational costs, especially salaries, might grow too quickly and become excessive. At your request, we reviewed the status of the Board's efforts to carry out its mission. Specifically, we are providing information on the status of the Board's (1) investigations and recommendations, (2) pay structure and use of staff, and (3) contracting activities. We are also providing information on our concerns about the Board's actions.

In summary, we found the following:

The Board has undertaken 11 full-scale investigations of chemical incidents and issued reports with recommendations on 2 of them. In addition, draft reports are in process for the remaining investigations. The Board's recommendations have aimed at encouraging industry and government agencies to upgrade their procedures, training, and communication of hazards.

As of February 1, 1999, the Board had 20 employees widely distributed among its offices, such as investigations, general counsel, and external relations, and 4

Board members. The average compensation is about \$89,000 in salary and benefits. The Board expects this average compensation to be reduced to about \$68,000 if it receives approval to hire up to 60 employees.

We identified eight contracts between the Board and other entities that cost \$100,000 or more. The total cost of the 8 contracts was about \$3 million. About one-third of this amount directly supported the Board's investigations. The balance involved acquiring such goods and services as the development of a web site, the establishment of a chemical incident data base, and the production of an informational video.

We have two main concerns about the Board's actions to date. First, the Board has not updated its August 1997 Business Plan to reflect the unanticipated backlog of ongoing investigations. Critical to any effective plan for addressing this backlog is an examination of how the Board chooses cases to investigate and how it allocates its existing and future resources. Second, the Board has not instituted formal, written procedures for its staff to follow in awarding and managing contracts. Such procedures can help ensure adequate internal controls and help avoid some contracting problems encountered by the Board.

BACKGROUND

The Board was created as an independent agency under the Clean Air Act Amendments of 1990.¹ However, the Board did not become operational until 1998 because of funding constraints. The act directed the Board to (1) investigate and report on the circumstances and probable causes of any accidental release of toxic or hazardous chemicals resulting in a fatality, serious injury, or substantial property damages; (2) recommend measures to reduce the likelihood or the consequences of accidental releases and propose corrective measures; and (3) establish regulations for the reporting of accidental releases. The act authorized the Board to conduct research and studies with respect to the potential for accidental releases and to issue reports concerning the prevention of chemical accidents to the Environmental Protection Agency (EPA) and Occupational Safety and Health Administration (OSHA). Furthermore, the Board is to coordinate its activities with other federal agencies such as the National Transportation Safety Board (NTSB) and OSHA.

According to relevant legislative committee reports, the Board is modeled after the NTSB, which retained the lead role in investigating transportation-related chemical incidents. The Board has no enforcement authority and a very limited regulatory role. Because the EPA and OSHA also have responsibilities in responding to chemical incidents, the Board has developed memorandums of understanding with these agencies to coordinate efforts and minimize potential duplication if they are investigating the same incident.

Chemical incidents occur regularly and often have serious consequences. According to a Board report, during the period 1987 to 1996, about 605,000 known chemical incidents occurred, including about 250,000 chemical incidents that occurred at fixed locations occupied by industrial and commercial businesses and about 260,000 incidents related to the transportation of chemicals.² On average, 127 incidents per year involved fatalities.

STATUS OF INVESTIGATIONS AND RECOMMENDATIONS

To carry out its mission of enhancing industrial safety, the Board conducts full-scale investigations and limited investigations (called reviews) of chemical incidents and makes recommendations. The status of these activities is discussed in the following sections.

Investigations

By statute, the Board investigates accidental chemical releases resulting in a fatality, serious injury, or substantial property damage. These investigations often involve extensive site visits, evidence collection, and analytical work. Because of limited resources, the Board decides where to initiate investigations. In these decisions, it weighs such factors as the expected impact of its work and the potential for similar incidents at other locations. The Board uses in-house and contractor staff, but assigns leadership to its own staff. The lead investigator is expected to direct the work, visit the site as necessary, and manage the report writing process. While the Board currently follows the Department of Energy protocols for accident investigations, it is now developing its procedures and expects to complete them by next year.

¹ 42 U.S.C. § 7412(r)(6).

² The 600K Report—Commercial Chemical Incidents in the United States, 1987–1996. February 1999.

The Board started five full-scale investigations in 1998 and, through March 30, six in 1999.³ Of the 11 investigations, 2 from 1998 have been closed and in each case, a report was issued. The first investigation took about 9 months and the second about 11 months from start to finish. Draft reports are in process for the remaining three investigations begun in 1998 and the six investigations begun in 1999.

Reviews

The Board conducts reviews when resources are not available to perform a field investigation, but knowledge about an incident could still provide valuable information for preventing future incidents. A review is performed within the Board's offices and relies mainly on documents and reports from other federal agencies and state agencies, as well as the companies' internal investigations. According to the Board, it takes about 40 days to gather and analyze information, which may not be available until 6 months after the incident, and additional time may be used to verify the facts and resolve legal and technical issues.

The Board started 14 reviews in 1998 and 9 in 1999. The Board has not issued any reports stemming from its reviews. As of March 30, 1999, it had closed 6 reviews with no report, was preparing a draft report for 3 ongoing reviews, and had yet to begin drafting a report for 14 ongoing reviews. According to an agency document, the six reviews were closed without reporting because, among other reasons, information was insufficient or conflicting, and some cases had limited application. Board officials told us, however, that the draft reports for the ongoing reviews are expected to result in valuable information for preventing future incidents.

Recommendations

As of March 30, 1999, the Board made a total of 22 recommendations in its two issued reports. The first report, dated September 1998, involved an accident at the Sierra Chemical Company in Nevada, where four workers were killed. The report contained 16 recommendations. The Board directed 10 recommendations to Sierra Chemical and other explosive manufacturers, 3 to the Institute of Makers of Explosives, 2 to the Department of Defense, and 1 to the Nevada Occupational Safety and Health Enforcement Section. The recipients of the first report have agreed to take corrective actions on 3 recommendations and are considering whether to take actions on the remaining 13.

The second report, dated February 1999, involved an accident at a Union Carbide plant in Louisiana, where 1 worker was killed. The report contained six recommendations. The Board directed two recommendations to Union Carbide and one each to the National Institute for Occupational Safety and Health, OSHA, the Center for Chemical Process Safety, and the Compressed Gas Association. The Board has received a formal response from Union Carbide and is aware of actions being considered by two other recipients of the recommendations. The company identified new safety policies that it would follow.

The Board's recommendations have aimed at encouraging industry and government agencies to upgrade their procedures, training, and communication of hazards. For example, the Board suggested that explosive manufacturers evaluate their safety programs to ensure that (1) written operating procedures are specific to the process being controlled; and (2) procedures and chemical hazards are communicated in the languages understood by personnel. It also suggested that the Institute of Makers of Explosives develop safety training guidelines and distribute the Board's report to its member companies. A listing of each recommendation and its status is provided in appendix I.

To obtain recipients' reactions to the Board's recommendations, we contacted the Department of the Army and OSHA. Officials from both agencies told us that the reports were on target. An Army official indicated that his agency was considering the recommendations, and an OSHA official confirmed that the agency intended to implement the recommendation.

A Board official said the Board plans to have a system in place to track recommendations by the spring of 1999. According to a draft directive, this system will be called the Safety Recommendation Tracking System and will track recommendations from the time they are issued until they are closed. The system will be used to follow-up on open recommendations and keep a permanent record of all recommendations.

³ Unless otherwise noted, all references to years will be fiscal years.

CURRENT AND PLANNED STAFFING LEVELS, RESPONSIBILITIES, AND SALARIES

The Board established a single-location organization with a central management office and five program functions, located in Washington, D.C.

Current Staffing Level and Responsibilities

As of February 1, 1999, the Board had 24 employees, including 4 of the 5 Board members. It expects to grow from 24 to 30 employees, including an additional board member, by the end of fiscal year 1999 and to 60 employees by the end of 2000 if its budget request of \$12.5 million is approved. According to its August 1997 Business Plan, the Board planned to grow to 88 employees in 2000, but it has now extended its timeline for this level of staffing to the end of 2001.

Table 1 identifies the allocation of staff, both current and planned, and assigned responsibilities in the agency organizational structure.

TABLE 1.—THE BOARD'S STAFFING LEVELS, CURRENT AND PLANNED, AND RESPONSIBILITIES, BY ORGANIZATIONAL UNIT

Office	Current staffing (2/1/99)	End of 1999 staffing (planned)	End of 2000 staffing (planned)	Responsibilities
Board member	3	4	4	Reviews and approves reports recommendations end regulations.
Chairman/Chief Executive Officer and Management.	4	7	9	Provides daily program supervision and ongoing operational planning and evaluation; provides budgeting technical writing and overall support to the organization.
General Counsel	3	3	9	Provides full range of administrative and programmatic legal services.
Safety programs	1	2	7	Directs design of safety policies and programs for the Board; oversees recommendations.
Investigations	5	6	13	Conducts accident investigations and reviews; prepares reports.
External relations	4	4	9	Disseminates public and media information; acts as liaison with business and academia; conducts governmental relations and international activities.
Information technology	4	4	9	Oversees information technology systems and operational programs; conducts administrative operations.
Total	24	30	60	

Note: The head of the Office of General Counsel also acts as head of the Office of Safety Programs.

Salaries

As of February 1, 1999, the Board had one GS-7 staff member, one GS-12, two GS-13s, 16 GS-14s or above, and 4 Board members. With this grade structure in place, the average annual salary is \$81,146, excluding benefits, for on-board employees. (See app. II for more details.) Combining salaries and benefits, the average annual compensation per employee will be an estimated \$89,100 at the end of 1999. Board officials said that the 1999 average salary will decrease as the Board hires more employees and the personnel base on which the average salary is computed increases. In fact, the Board is requesting \$4.1 million in personnel compensation and benefits in 2000 for 60 positions; that would result in an average annual compensation package, combining salaries and benefits, of \$68,183 per employee in 2000.

In a proposal to the Office of Personnel Management, the Board asked approval for six senior executive positions. After consulting with OMB, the Office of Personnel Management approved one permanent and two temporary positions. The Office said that it was awaiting the completion of this ongoing GAO study and it was obligated to maintain a reduced number of senior executives in the government. The Office of Personnel Management told the Board that its request would be re-evaluated during the fall, 2000–2001 biennial assessment period.

CONTRACTING ACTIVITIES

The Board contracted with outside entities to help carry out its mission during 1998 and 1999. Excluding the contract for renting office space, we identified eight

contracts costing \$100,000 or more.⁴ The total cost of these contracts was about \$3 million. Table 2 provides information on these contracts.

TABLE 2.—BOARD CONTRACTS OF \$100,000 OR MORE, 1998 AND 1999

Contractors	Purpose/description of contracts	Amount obligated
Oak Ridge National Laboratory (ORNL).	Investigative support.—The contractor assists the Board by conducting several investigations and preparing reports, including managing investigations, collecting evidence, and conducting interviews. Strategic Plan.—The contractor assists the Board in the development of a 5-year information technology plan. ORNL is a Department of Energy laboratory that provides support to various federal agencies. The \$758,000 listed here is the cost of requested services during 1998; as of March 1999, the Board has requested an additional \$915,000 of services.	\$758,000 915,000
Battelle Memorial Institute	Investigative support.—The contractor assisted the Board in conducting the Sierra Chemical investigation in Nevada, including labor and material for technical services and preparing a written report of the chemical incident.	410,000
Tri-Data	Establishment of chemical incident baseline and database.—The contractor analyzed and prepared a summary report on 10 years of data from five federal government agencies' data bases to establish a chemical incident baseline. Currently, the Board is designing a chemical incident data base that will be located at the Board and populated with data from at least the five government data bases. The data base is to be used to help show where, when, and how often incidents are occurring in a particular area. The information will form the basis for recommendations on programs, regulations, and other actions to help reduce chemical incidents. The report is scheduled for completion by May 31, 1999.	350,000
Bell-Atlantic	Internet and Intranet web site development.—The contractor is expected to create and maintain a web site with documentation that includes file structures, database table structure, site architecture, and security information. A technical person from the contractor is dedicated fulltime to the Board. The cost is not to exceed \$231,000 through September 1999.	231,000
Rowland Productions	Informational video. In August 1998, the Board contracted with Rowland to produce a video that portrays what the agency does. The intended audience for the video includes the general public, industry, employee and environmental groups, and government officials. Five companies competed for the contract. The selected vendor's offer includes plans for video insets tailored for specific audiences. Work was temporarily suspended on the video because of the press of other business in early 1999.	160,000

⁴ We excluded the contract for leasing office space because of its nondiscretionary nature.

TABLE 2.—BOARD CONTRACTS OF \$100,000 OR MORE, 1998 AND 1999—Continued

Contractors	Purpose/description of contracts	Amount obligated
Federal Emergency Management Agency (FEMA).	Internet service.—The Board contracted with FEMA to host, update, and administer the Board's web site and e-mail at a cost up to \$100,000 in 1998. National Emergency Coordination Center.—During 1998 and 1999, FEMA provides the Board with a 24-hours-a-day, 7 days-a-week communications center that supports the Board at a cost of \$50,000 per year. (The 1998 charge was prorated.).	137,000
Bell-Atlantic	Helpdesk support.—This is a 1999 award that covers helpdesk support and local area network support.	130,000
National Ground Intelligence Center.	Software development.—In July 1998, the Board contracted with the National Ground Intelligence Center, an organization within the Department of Defense, to develop a civilian version of military intelligence software that will help a facility determine where its safety systems are prone to failure and how to best address the problems. The Center would develop a prototype initially then build toward a full operational capability that the Board plans to make available to companies for their confidential use. Software development would continue for a number of years. The total cost is not yet known, but the Board obligated \$100,000 in 1998 funds for this purpose and expects to spend another \$200,000 each year from 2000 through 2002, if funds are made available..	100,000
Total		3,191,000

Note: Dollar amounts are rounded to the nearest thousand.

CONCERNS ABOUT THE BOARD'S ACTIONS

On the basis of our review of the Board's actions to date, we have two main concerns. First, the Board has not updated its Business Plan to reflect the unanticipated backlog of ongoing investigations. Second, the Board has no written procedures for its staff to follow in awarding and managing contracts with outside entities.

Updated Business Plan

In its August 1997 Business Plan and support for its 1999 budget submission, the Board set forth its expectations that it would be able to complete its investigations within 6 months and conduct from 5 to 10 investigations during 1998 and from 13 to 19 investigations during 1999. However, the Board has completed and reported the results for two investigations since commencing operations in January 1998. These investigations took 9 and 11 months from start to finish. Actual in-the-field investigations have been concluded for another seven investigations, and draft reports have been in process since as long as April 1998. The Board has also yet to issue any reports based on its reviews. It closed 6 reviews without a report and, as of March 30, 1999, has 17 open reviews. Draft reports are in process for 3 of the 17 open reviews. Board officials told us that their expectations for conducting investigations in 1999 were based on getting requested funding. Also, their agency was not yet fully operating, and existing investigation resources were needed to complete the backlog of open investigations and reviews. As a result, the Board could undertake no new investigations from mid-March 1999 through the end of the fiscal year in September. On March 29, the Board wrote to this Subcommittee confirming its freeze on new investigations.

In our view, the unanticipated backlog and the slower-than-expected progress in completing ongoing investigations and reviews raise questions about how the Board decides which incidents to look into and how it allocates its staffing and financial

resources. The Board does not intend to update its August 1997 Business Plan but is working with OMB to develop a strategic plan by February 2000 that complies with the Government Performance and Results Act. The Board intends to identify the criteria for selecting incidents in this strategic plan and reallocate resources as a management decision after addressing the backlog.

Criteria for Selecting Incidents to Investigate and Review

According to Board officials, about 200 chemical incidents are reported to the Board each day. Fatalities, serious injuries, and significant property damage often occur, and the Board does not have the resources to conduct an on-site, full-scale investigation of every incident with serious consequences or even a limited review of such incidents. In deciding which incidents to investigate and review, the Board uses criteria weighted toward accidents in which fatalities occur. Some judgment is still, of course, involved, and the Board uses factors such as a high level of interest that should make it easier to implement recommendations and the potential for similar incidents at other locations. The Board would have to weigh the various consequences of revising the criteria in ways that would either raise or lower the bar; in other words, be more or less selective in choosing which cases to pursue. By raising the bar, workload would be limited. Although factors such as complexity of the incident and the extent of cooperation by company officials affect how quickly cases can be completed, a more limited workload would help to speed up the closure of existing cases. By lowering the bar, workload would be increased and existing cases would tend to take longer to close or additional resources would need to be allocated to investigations, helping the Board to complete these cases more quickly.

Allocation of Resources

The Board's Business Plan, in setting expectations for the new organization, assumed a \$4 million budget in 1998 and a \$7 million budget in 1999. In its formal budget request, the Board asked for \$8.2 million for 1999. In its actual appropriations, the Board received the full \$4 million in its first year and \$6.5 million in 1999. According to the Board, it spent 30 percent of its \$4 million budget in 1998 on incident prevention (primarily investigations and reviews). The Board expects to spend 37 percent of its 1999 budget and 44 percent of its 2000 request for this purpose.

Regardless of what the Board expected its funding levels to be, the Board has encountered difficulties in handling its workload. An examination of how the Board would allocate its existing resources and spend future funds assuming differing levels of funding in 2000 and beyond is critical to any effective plan for addressing the backlog of ongoing investigations and reviews.

One area for review is the Board's staffing allocation. According to the plan, the Board would establish a flat organization. To the maximum extent possible, it would buy services when and as needed, thereby keeping staffing levels and overhead costs low, and permitting the bulk of resources to be devoted to its mission. As of February 1, 1999, the Board employed four in-house investigators; one began work in July 1998, two in September 1998, and the other one in November 1998. The investigators have a caseload of two to three investigations and five to six reviews. At times, the Board also uses noninvestigative staff, such as program analysts, to assist with investigations and reviews. The Board also allocated four staff members to its external relations and three to its general counsel offices. If its budget request for 2000 is approved, the Board intends to have 13 (or 22 percent) of its 60 total personnel in its investigations unit compared with 9 each in its external relations and general counsel units (together equaling 30 percent of total staffing). The Board would allocate the remaining 29 staff (48 percent) to other offices, such as the Chairman's staff, safety programs, and information technology.

For comparison purposes, we obtained resource allocation information from NTSB, the agency considered in the legislative history as the model for the Chemical Safety Board. NTSB investigators comprise 40 percent of the organization's staffing while personnel in its legal and public affairs offices together comprise about 5 percent.⁵ Like the Board, NTSB investigators work on multiple investigations at a time and use contractors to support their work. Unlike the Board, NTSB can obtain voluntary services labor hours that are not reimbursed from outside entities. The Board

⁵ Of the 402 personnel on board in April 1999, NTSB has 162 investigators, 11 employees in its Office of General Counsel, and 11 staff members (excluding those performing the function of working with affected families after an accident) in its Office of Government, Public, and Family Affairs. NTSB also has other staff, such as Administrative Law Judges, performing legal-related work.

has recommended to the Congress that it be authorized to obtain these voluntary services.

To deal with the existing backlog of cases and expected new cases, the Board could also review its use of funds now spent on contracting. About two-thirds of these funds are not related directly to investigations but support accomplishment of its mission in other ways. An updated Business Plan would help the Board to determine the appropriate balance, at different levels of funding, between using more of its resources to do investigations versus investing in other mission-related activities.

Controls Over Contracts

In its Business Plan and other key documents, the Board stated that its approach to doing business would emphasize contracting out or outsourcing. The Board contended that doing so would enable it to avoid the expense associated with establishing a large permanent administrative infrastructure and having to make a long-term commitment of funds for such items as space and equipment.

The Board pursued this approach within a week of its commencing operations when it asked an outside entity to investigate an accident. A chemical incident causing four fatalities occurred at Sierra Chemical Company's plant in Mustang, Nevada, on January 7, 1998. Two days later, the Board wrote a letter to Battelle authorizing the contractor to begin incurring labor and travel costs starting January 8 and before a formal contract had been signed. According to the statement of work, Battelle would provide labor and materials to assist the Board in the investigation and would also provide a written report delineating the explosion. The Board estimated the contract would be in the \$250,000 range. The Board believed that it was entering into a work for others arrangement with the Pacific Northwest National Laboratory, which is owned by the Department of Energy (DOE) and run by Battelle. Under a work for others arrangement, a DOE laboratory may conduct work for other federal agencies on a cost-reimbursable basis.

On the basis of our file reviews and interviews with Board officials, we found that concerns surfaced almost immediately about the growing costs of Battelle's work. The Board was surprised to learn that it was using Battelle directly rather than working through DOE's Pacific Northwest National Laboratory, with Battelle as a subcontractor. As a result, the Board noted that it was being charged higher rates under a noncompetitive arrangement with Battelle. According to Board officials, they attempted to control costs by asking Battelle to take people off of the investigation and proposing contract terms that put Battelle in the position of working through the federal laboratory. The Board ultimately signed an agreement with Battelle directly, dated March 17, 1998, to pay \$410,000, including a fixed fee of \$54,000, for its services. On that day, a Board official wrote a memorandum to the file that the Board was still trying to get information from Battelle that would support the contract cost.

The Board has taken some steps to ensure that a repeat of the problems described earlier would not recur. First, it has decided not to use Battelle directly again in a noncompetitive arrangement. Second, the Board has employed a more structured approach for acquiring support for its investigations. In an agreement with DOE's Oak Ridge National Laboratory, the Board identifies tasks, the laboratory estimates the costs for performing those tasks, and the Board provides authorization and reimbursement for services provided by the laboratory as appropriate. The Board also receives a monthly report from the laboratory on progress, accomplishments, status, and planned work for the next month. We believe these are prudent steps for protecting the government's interests.

In the Battelle case, formal, written contracting procedures—based on the Federal Acquisition Regulation but tailored to the Board's needs—were not available to the staff. The Board told us that these procedures are now being developed. However, more than a year has elapsed since it signed the agreement with Battelle for which the Board expressed such concern. The importance of instituting formal procedures is even greater given the Board's reliance on contracted support for not only investigations but also other mission-related tasks.

Under the Federal Acquisition Regulation, contracting officers are responsible for ensuring that applicable procedures have been followed before an agency enters into a contract. For the major contracts we reviewed, we found that the contracting officer has been the Board's Program Officer, the second-in-command in the organization, who has multiple responsibilities. We asked the Board about its need for a full-time contracting officer. The Board told us that there were only seven full-time-equivalent employees in 1998, and the Board did not award enough contracts to justify establishing and filling a contracting officer position. The Board did not comment on its reasons for not establishing such a position in 1999. In the Battelle

case, even with a limited staff, such an officer could have informed the Board of the proper procedures for obtaining work-for-others-type assistance. If the Board does not consider it cost-effective to establish a contracting officer position in-house, alternatives such as the use of technical support from the General Services Administration or another federal agency could be explored.

SCOPE AND METHODOLOGY

To review the status of the Board's efforts to carry out its mission, we reviewed documents supplied by the Board related to its planning, budgeting, and programs; personnel data such as salary information; and contract files. We interviewed officials from the Board; other federal agencies, including the NTSB, OSHA, the Department of the Army, and OMB. We conducted our work between January through April 1999 in accordance with generally accepted government auditing standards.

AGENCY COMMENTS

We provided a draft of this statement to the Board for its review and comment. We met with the Chairman and other Board officials. They generally agreed with the information contained in this statement but provided clarifications and corrections, which we incorporated as appropriate.

The Board also pointed to considerations that it believes, in the interest of fairness, should be recognized. First, the Board has the unique status of being a start-up agency. It did not have the advantages of having staff or even office space and found itself putting an infrastructure in place to provide services while at the same time beginning to provide those services. The Board stated that our concerns about the unanticipated backlog of investigations and absence of written procedures for contracting should be viewed in the context of their being a new agency. Second, the Board is expected to accomplish a broad and complex mission but has only limited resources to do so. The Board said that while this mission extends beyond investigations to other activities designed to enhance industrial safety, the Board has had the equivalent of only 5 full-time employees in 1998 and 24 in 1999.

We recognize in our statement that the Board is a start-up agency. Accordingly, we believe the Board's comments highlight the opportunity the Board now has to consider its future allocation of staff and financial resources. For example, the Board has greater flexibility as a start-up agency to find the appropriate balance, at different levels of funding, between using its resources to do investigations versus investing in other mission-related activities.

STATUS OF RECOMMENDATIONS

Listing of the board's safety recommendations contained in the two investigation reports issued by the board and the recipients' responses to the recommendations--as of March 30, 1999

Table I.1: Investigation at the Sierra Chemical Company, Mustang, Nevada. Two explosions at an explosives manufacturing facility killed four workers and injured six.

Recommendation was directed to	Recommendation	A ^a	D ^b	P ^c	Comments
Company and explosives manufacturers	Explosives manufacturers should evaluate the effectiveness of their explosives safety programs to ensure that:				A bill pending in the Nevada state legislature would require, among other things, that the relevant state agency adopt regulations establishing standards and procedures for places of employment where explosives are manufactured.
	(1) Process hazard analyses include the examination of quantity- distance requirements, building design, human factors, incident reports, and lessons learned from explosive manufacturers.			X	The company has not yet responded to the Board's recommendation letter. However, the plant was destroyed in the blast and has not been rebuilt. The Board will send a follow-up letter to the company.
	(2) Written operating procedures are specific to the process being controlled and address all phases of the operation.			X	
	(3) Procedures, chemical hazards, and process safety information are communicated in the language (s) understood by personnel involved in manufacturing or handling of explosives.			X	A bill pending in the state of Nevada would require that workers receive safety training in a language they understand.
	(4) Explosives training and certification programs for workers and line managers provide and require the demonstration of a basic understanding of explosives'			X	

	safety principles and job-specific knowledge. (5) Process changes, such as the construction or modification of buildings, or changes in explosive ingredients, equipment, or procedures are analyzed and Process Safety Management elements are updated to address these changes.				X	
	(6) Pre-startup safety reviews are performed to verify operational readiness when changes are made.				X	
	(7) All elements of OSHA's Process Safety Management Standard are verified by performing periodic assessments and audits of safety programs.				X	
	(8) The employee participation program effectively includes workers and resolves their safety issues.				X	
	(9) Explosive safety programs provide an understanding of the hazards and control of detonation sources.				X	
	(10) The following issues are addressed in plant design or modification: <ul style="list-style-type: none"> • Operations in explosives manufacturing plants are separated by adequate intraplant distances to reduce the risk of propagation. • Unrelated chemical or industrial operations or facilities are separated from explosives facilities using quantity-distance guidelines, and • Facilities are designed to reduce secondary fragmentation that could result in the propagation of explosions. 				X	
Institute of Makers of Explosives (IME)	(1) Develop and disseminate process and safety training guidelines for personnel involved in the manufacture of explosives that include methods for the demonstration and maintenance of proficiency.	X				In February 1999, IME submitted a proposed revision to OSHA's explosives safety standard for the Board's review. The proposed revision includes a section on worker training. The Board is studying the document and will respond to IME.
	(2) Distribute the Board's report on the incident to IME member companies.	X				
	(3) Develop safety guidelines for the screening of reclaimed explosive materials.				X	IME will work on this recommendation at its May meeting.
Nevada (OSHA)	(1) Increase the frequency of safety inspections of explosives manufacturing due to their potential for catastrophic incidents.	X				Nevada's Governor signed an executive order requiring inspections at least twice a year.
Department of	(1) Develop a program to ensure that reclaimed,				X	Letter received from the Secretary of the Army stating

Defense	demilitarized explosives sold by the Department of Defense are free of foreign materials that can present hazards during subsequent manufacturing of explosives.					that DOD will study the recommendation.
	(2) Provide access to explosives incident reports and lessons learned information to managers and workers involved in explosives manufacturing, associations such as IME, government agencies, and safety researchers.				X

CONCLUSION OF HEARINGS

Senator BOND. We recognize this is a new agency and some time is needed to for it to become fully operational. We acknowledge the mission set forth for the board is important. The message needs to be heard loud and clear from us. However, the agency needs to improve significantly its operations if it expects to continue receiving support from this Committee.

And with that statement, we will conclude the hearing.

[Whereupon, at 12 p.m., Thursday, April 29, the hearing were concluded, and the subcommittee was recessed, to reconvene subject to the call of the Chair.]

**DEPARTMENTS OF VETERANS AFFAIRS AND
HOUSING AND URBAN DEVELOPMENT AND
INDEPENDENT AGENCIES APPROPRIATIONS
FOR FISCAL YEAR 2000**

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

**MATERIAL SUBMITTED BY AGENCIES NOT APPEARING FOR
FORMAL HEARINGS**

[CLERK'S NOTE.—The following agencies of the Subcommittee on VA, HUD, and Independent Agencies did not appear before the subcommittee this year. Chairman Bond requested these agencies to submit testimony in support of their fiscal year 2000 budget request. The statements submitted by the chairman follow:]

INDEPENDENT AGENCIES

DEPARTMENT OF HEALTH AND HUMAN SERVICES

AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

PREPARED STATEMENT OF JEFFREY P. KOPLAN, ADMINISTRATOR

Thank you for the opportunity to provide a written statement regarding the Agency for Toxic Substances and Disease Registry's (ATSDR) President's budget for fiscal year 2000.

ATSDR is a federal agency created by Congress in 1980 by the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), or what is more commonly known as Superfund legislation. As such, ATSDR is the public health agency charged with determining the nature and extent of health problems at Superfund sites, and advising the U.S. Environmental Protection Agency (EPA) and State environmental agencies on needed clean-up and other actions to protect the public's health. To accomplish this mandate, ATSDR received \$76 million in fiscal year 1999.

We are proud of our accomplishments in addressing a key mandate—learning more about the association between exposure to toxic substances and adverse health effects and the prevention of illness at Superfund sites. As presented in other Congressional testimonies, ATSDR's health studies have revealed an increased risk of birth defects, certain cancers, respiratory illness, neurologic disease and other health conditions in populations living near hazardous waste sites.

ATSDR works in close collaboration with the EPA, other federal, state, local, and tribal governments, health care providers and affected communities. The agency has made a difference to all of these partners by providing new information to assist in remedial decision-making, answering the health questions of impacted community members, recommending preventive measures to protect public health, and providing diagnosis/treatment information to local health care providers.

The President's budget of \$64 million will allow the agency to continue to conduct many programs that support our mandate (see Program Output table on the following page). ATSDR will administer public health activities through: state partnerships; public health assessment and consultation activities; exposure investigations;

health studies and registry activities; development of toxicological profiles and attendant research; emergency response; health education and health promotion; and community involvement during fiscal year 2000.

DETERMINING NATURE AND EXTENT OF PUBLIC HEALTH PROBLEMS AT SITES

Public health assessment and consultation activities

ATSDR's public health assessment and consultation program is the starting point for all of the agency's site-specific health activities. The assessment is the basis for public health advisories or other health recommendations, and for identifying studies or actions needed to evaluate human health effects and mitigate or prevent adverse health effects. During the initial phase, ATSDR evaluates the available information, determines data needs, assesses the exposure scenarios (e.g., whether or not people are being exposed to environmental hazards and how exposure may be occurring) and determines which actions, products and services are necessary to provide an effective and efficient public health response.

ATSDR PROGRAM OUTPUT TABLE

Program	Fiscal years—		
	\$74 million 1998 actual	\$76 million 1999 estimated	\$64 million 2000 projected
Cooperative Agreement States	26	29	23
Sites Addressed	495	500	400
Public Health Assessment Documents	110	110	90
Health Consultations	915	1,000	800
Exposure Investigations	50	65	30
Site-Specific Environmental Health Intervention	10	8	6
Backlogged Sites Addressed	38	56
Health Studies:			
New	10	12
Continued	22	23	27
Exposure Registry (number of sites)	21	22	21
Minority Health Professions Foundation Research Projects	13	12	9
Great Lakes Research Projects	10	10	5
Toxicological Profiles	¹ 6	8	6
Pediatric Environmental Health Specialty Units	3	6	1
Medical Monitoring	² 1	³ 1

¹ In addition to beginning six profiles in FY 1998, ATSDR updated 21 profiles with children's health sections.

² Feasibility study in fiscal year 1998.

³ To be initiated in FY 1999 depending on outcome of feasibility study.

ATSDR's public health assessment (PHA) program evaluates data and information on the release of hazardous substances into the environment and assesses past, current, or future effects on public health. The PHA program is ATSDR's principal tool for identifying communities that need further public health follow-up. In fiscal year 2000, ATSDR anticipates developing 90 public health assessment documents.

ATSDR develops health consultations to provide advice and/or technical assistance on specific public health issues that result from actual or potential human exposure to a hazardous material. A health consultation is often quickly needed to permit mitigation or prevention of adverse human health effects from such exposure. The agency provides consultations on hazardous waste sites to EPA, other federal agencies, state and local health and environmental agencies, individual members of the public, and communities. ATSDR will provide approximately 800 health consultations in fiscal year 2000.

In May 1997, ATSDR presented to Congress 234 hazardous waste sites for which the agency and its public health partners were not able to conduct necessary public health activities. In fiscal year 1998 and 1999, ATSDR addressed 94 of these sites through public health assessment activities, health education and promotion activities, exposure assessments, and health studies. Significant results have been noted, with five sites found to be public health hazards and ten sites requiring follow-up health activities. In fiscal year 2000, the agency will be unable to initiate action at any of these historic "backlogged" sites, and the number of such sites is anticipated to increase.

State partnerships

When Congress reauthorized Superfund, the health section of the statute was strengthened, and a partnership was envisioned between states and ATSDR. The

agency committed to building or enhancing state health departments' capacity in environmental health. For the last three years, ATSDR has provided more than \$10 million per year to states for health assessments, health studies and health education and promotion activities at the sites where we work. This cooperative agreement program enhances the collaboration between Federal, state, local, and tribal health and environmental officials who are the experts on issues related to site characterization, contaminant removal activities, site remediation, site-specific health education and health promotion, and health studies. This collaboration ensures that risk managers are provided timely public health input throughout the site characterization, assessment, and remediation process; and that community and health professional educational needs are met with early, integrated involvement. It further insures that health outcome data, environmental monitoring results, and demographic data are collected and analyzed in a scientifically valid manner. In fiscal year 2000, ATSDR anticipates supporting 23 states through the state cooperative agreement program.

Exposure investigations

The lack of reliable information on actual human exposure has hampered ATSDR's assessments of adverse impacts of environmental contamination. ATSDR has therefore initiated independent activities to provide better measures of exposure, to better define populations likely to be exposed, and to develop more accurate estimates of exposure. An exposure investigation is a key approach that ATSDR uses to develop better characterization of past, current, and future human exposures to hazardous substances in the environment and to evaluate existing and possible health effects related to those exposures. ATSDR will conduct exposure investigations in fiscal year 2000 at 30 sites.

Emergency response

ATSDR is responsible for providing technical assistance to Federal, state, and local government and emergency organizations during emergency situations resulting from the unplanned release of hazardous substances. In emergency situations, site-specific or chemical-specific consultation teams can be convened to provide immediate public health support 24 hours a day, seven days a week—usually within 30 minutes. Consultation teams can operate independently on focused, short-term tasks or can serve as part of a large multi-agency task team addressing more complex issues. ATSDR will continue emergency response activities in fiscal year 2000.

Health education and promotion

ATSDR's health education and promotion program encompasses the overall goals of educating individuals, communities, and health-care providers about the health effects of hazardous substances in the environment; working with affected communities to develop and promote public health strategies to mitigate the health impact of hazardous substances; and disseminating environmental health education materials, training, and information. The agency will conduct a range of site-specific health education activities at a total of 400 sites in fiscal year 2000.

A critical part of ATSDR health education activities is involving communities in public health decisions and actions that affect them. We assure collaborative opportunities are available for communities by integrating them into the process of planning, goal-setting, and the design and implementation of public health activities. This interactive process requires new and creative ways of thinking and working that lead to broad understanding of agency public health activities and responses.

The hallmark of ATSDR's health promotion program is the use of community-driven approaches to promote education and training for health care providers and other health professionals, to facilitate access to environmental medical services, and to establish the connection between environmental and public health practice. Provider education affords health care practitioners with a better understanding of the situation so that they can assist in making appropriate public health decisions for the community and themselves.

Health promotion activities also include site-specific environmental health interventions (EHI). These interventions cover such services as specialty clinical evaluations, diagnosis, and referrals for exposed individuals at risk of adverse health effects. The EHI establishes a partnership between public health professionals, primary care practitioners, and environmental specialists and involves the diagnosis and prevention of illness caused or influenced by hazardous substances in a community environment. In fiscal year 2000, ATSDR will support anticipated site-specific environmental health interventions at six sites.

A medical monitoring program is broader in scope than an EHI, and may be conducted over a longer period of time. ATSDR is currently conducting the first phase of the Bunker Hill medical monitoring program. Approximately 8,500 persons living

in the area around a refinery located in Kellogg, Idaho, between the years 1973 and 1981, were placed at significantly increased risk of adverse health effects as a result of excessive exposure to lead, cadmium, and arsenic. Initial outreach and feasibility assessment activities are being conducted in the State of Idaho, where an estimated 1,700 persons who were exposed to contaminants continue to live.

ASSOCIATION BETWEEN TOXIC EXPOSURE AND ILLNESS

Health studies

ATSDR conducts and supports health studies to evaluate the relationship between exposure to hazardous substances and adverse human health effects. This relationship can be described as a sequence of events leading from contamination in the environment to possible presence of illness in exposed people.

As ATSDR has reported previously, when evaluated in aggregate (i.e., by combining health data from many Superfund sites), living near hazardous waste sites seems to be associated with increased risk of some kinds of birth defects and, though less well documented, some specific cancers. Several ATSDR health studies completed in the last couple of years confirm and help clarify this finding. For example:

- Women who live within ¼ mile of National Priorities List (NPL) sites in California were more than three times as likely to have infants with conotruncal heart defects and more than twice as likely to have infants with neural tube defects.
 - Women who were 35 years old or older and who had been exposed to tetrachloroethylene (PCE) in drinking water at Camp Lejeune, North Carolina, were four times more likely to have infants who were small for their gestational age.
 - Women who lived closest to 38 landfills in New York had a fourfold elevation in incidence of bladder cancer and leukemia, in comparison to women living further away.
 - Women who lived near a Connecticut NPL site in areas where exposure to TCE was estimated to be highest had an elevated risk for non-Hodgkin's lymphoma.
- Examples of other adverse health outcomes include:
- Nineteen to 20 years later, young adults who had been exposed during childhood to high levels of lead at the Bunker Hill NPL site were more likely to have neurologic signs and symptoms and infertility than were young adults in a comparison group.
 - Children in Groton, Massachusetts, who were most likely exposed to solvents in drinking water generally had lower scores on two of four tests that indicate they had learning disabilities.
 - Women formerly employed at a lead smelter, now an NPL site, in Silver Valley, Idaho, had an earlier onset of menopause than did women in a comparison group.

As the above findings demonstrate health studies are key to formulating public health actions for specific Superfund sites. Ongoing studies will continue in fiscal year 2000.

In the past year, ATSDR has initiated activities to investigate possible links between elevated rates of children's cancers in Toms River and exposures to hazardous substances. These actions include: a multi-site study examining the rates of brain cancer among residents, a multi-state case control study of childhood brain cancers, a review of available chemical data for the Dover Township area, and public health intervention activities including health care provider updates. Elevations in overall cancer incidence were confirmed for Dover Township and the Toms River section, particularly among female children under 5 years of age. At the \$64 million level, ATSDR will continue many of these activities in Toms River.

Health registry activities

The ATSDR National Exposure Registry catalogs reported health information from individuals with documented exposures into chemical-specific sub-registries. These sub-registries are designed to aid in assessing the long-term health consequences of low-level, long-term exposures to hazardous chemicals identified at hazardous waste sites. The National Exposure Registry currently consists of four established subregistries: Trichloroethylene (TCE), Dioxin, Trichloroethane (TCA), and Benzene. Registrants on all four subregistries have reported increases of such problems as birth defects, diabetes, stroke, anemia, and learning disorders.

Analysis of the approximately 5,000 female registrants across all registries revealed statistically significant increases in reports of several health outcomes. Those found predominantly in women included diabetes, kidney problems, liver problems

and urinary tract disorders. A more definitive assessment of these associations is currently underway.

Substance specific information and research

Serious gaps exist in scientific knowledge about the toxicity, bioavailability, and human health effects from individual hazardous substances and mixtures of substances released from Superfund sites and during emergency releases. ATSDR's Applied Research Plan heavily emphasizes the collection of human data to validate the substance-specific exposure and toxicity findings of animal and human studies that are currently open to interpretation.

ATSDR's mechanisms for filling priority data needs include academic-based research conducted through the Minority Health Professions Foundation, a congressionally mandated program. ATSDR-supported research on lead has found (1) a highly significant relationship between lead levels in blood and blood-pressure in pregnant women; and (2) that infants born to mothers with higher blood-lead levels demonstrate differences in the areas of motor skill development, general muscle tone, and hand-to-mouth activities shortly after birth. Another significant study is being conducted on di-n-butylphthalate, a compound often used in making plastic products—there is a great potential for exposure to babies and young children through items such as soft plastic toys, pacifiers, and teething rings. Results have shown that this compound caused endocrine disruption in laboratory animals. In fiscal year 2000, ATSDR will continue research for filling critical data needs.

ATSDR supports another congressionally earmarked research program which investigates the potential for adverse human health effects resulting from consumption of contaminated fish. Contaminants of concern include dichlorodiphenyl trichloroethane (DDT), methylmercury, polychlorinated biphenyls (PCBs), dioxin and alkylated lead. Principally focused in the Great Lakes area, current activities include analyzing biologic samples of study populations; analyzing sub-clinical health effects data and other identified sensitive health endpoints; conducting tests to identify neurobehavioral impacts in newborns, infants, the elderly, and native Americans; assessing the impact of exposure to toxic substances on male and female fertility; initiating studies for trans-generational effects in at-risk populations; and evaluating mercury levels in women before, during and after pregnancy. In fiscal year 2000, activities will continue.

ATSDR provides critical information to Federal, state, and local public health agencies and other organizations that respond to toxic chemical emergencies and assess hazardous waste sites through our toxicological profiles. The profiles interpret the available exposure and health effects data of a substance, determine the levels of exposure that present a significant risk to humans, and identify the research necessary to determine the types or levels of exposure that might present significant risks for adverse health effects in humans. At the President's budget of \$64 million, ATSDR will develop six toxicological profiles.

ATSDR HAS MADE A DIFFERENCE

Improved remediation decision making

ATSDR's recommendations to EPA (or the state counterpart) have been routinely adopted. Our data show that more than 80 percent of the recommendations we have made in public health assessments or consultations have been accepted or are still pending. This percentage is even higher for those recommendations dealing with reducing exposure.

A good example of this close positive working relationship is the use of ATSDR's work by EPA in the clean-up of methyl parathion in Mississippi and then later in Alabama, Arkansas, Illinois, Louisiana, Tennessee and Texas. Using both the EPA environmental sampling coupled with ATSDR's biological measurements, the agencies jointly developed criteria to set priorities concerning temporary relocation of residents, reentry back into homes, and referral to local health care providers. Overall, approximately 18,000 people (including 10,000 children) were positively impacted by this collaboration.

Responded to community concerns

ATSDR has made a concerted effort in the past several years to be more proactive in dealing with community concerns. We have revised the public health assessment process to actively seek out health data from the affected community as an integral part of the process. This has also resulted in a new group of individuals hired by the agency whose sole job is to routinely interact with the affected community early in the process and throughout ATSDR's involvement at their site. At sites where there are heightened concerns, ATSDR has formed community assistance panels to

insure ongoing partnerships in investigating the site to insure full community involvement in health assessments and health studies.

One example of a site where ATSDR successfully dealt with a community's concerns is the Trinity American Site in Glenola, North Carolina. Local residents petitioned ATSDR with concerns about possible air emissions from a foam-making process which resulted in chronic and acute adverse health affects in nearby residents. ATSDR's investigation of these complaints included environmental monitoring which showed elevated levels of toluene diisocyanate (TDI) at the plant and in the community, and blood testing which indicated the community's exposure to TDI. ATSDR's public health advisory alerted the State and EPA to the problem. As a result the plant stopped manufacture of fiber and foam until the company could come into compliance with air emission standards, and individuals with high antibody levels for TDI were referred to the Duke University Medical Center for clinical evaluation.

Improved access to and training for health care providers

ATSDR's data indicates that over 1.5 million children 6 years and younger live within a one-mile boundary of current NPL sites. Compared to adults, children often have greater exposures, greater potential for health problems, and less ability to avoid exposures. Most pediatricians need a reliable clinical resource for specialty referrals and training in environmental medicine. As one method to address this issue, the children's health program is in the process of establishing environmental and pediatric cross-specialty units focused on pediatric environmental medicine, education, training, and expert consultation, as well as clinical specialty referrals for children.

ATSDR, and its partners, have developed a national strategy establishing Pediatric Environmental Health Specialty Units (PEHSUs). PEHSUs are designed to develop medical expertise in pediatric environmental health by: (1) implementing regional pediatric environmental medical education and health promotion programs; (2) serving as pediatric environmental medicine consultants; and (3) functioning as referral centers for clinical evaluations of children exposed to hazardous substances.

In fiscal year 1999, ATSDR will maintain the three existing PEHSUs and add three additional clinics. The three new units will significantly enhance ATSDR's and EPA's ability to address the wide ranging environmental health problems. PEHSUs collaborate with ATSDR in the development of pediatric environmental medicine clinical evaluation guidelines.

In addition, ATSDR is working with other federal agencies to evaluate the feasibility of developing a national childhood cancer registry; strengthening and accelerating focused research into the environmental factors that cause or worsen childhood asthma; examining associations between childhood autism spectrum disorders and pre-natal/post-natal exposures to environmental pollution; and determining the magnitude of children's inordinate risk of exposure to hazardous waste sites due to the proximity of schools to these sites. In fiscal year 2000, ATSDR will maintain one operational PEHSU to provide physician training, consultation and referrals for children who have had environmental exposures and health-related problems.

ATSDR has for more than 15 years applied the disciplines of environmental health science, epidemiology, toxicology, and health education to assess real and potential human health effects as related to hazardous substances. The agency has learned valuable information about the association of certain diseases and exposure to toxic substances and has used this information to help communities and environmental and health organizations to prevent and reduce potentially hazardous exposures. The agency has made a difference in the daily lives of many communities and in the body of knowledge in environmental health science. As the principal public health agency charged with determining the nature and extent of health problems at Superfund sites we will continue to strive to prevent exposures to hazardous substances and adverse human health effects.

This concludes our testimony. Once again, we want to thank the Subcommittee for the opportunity to provide written testimony on our budget. We would welcome any questions subcommittee members might have and will be happy to provide written answers for the record.

AMERICAN BATTLE MONUMENTS COMMISSION

PREPARED STATEMENT OF GEN. FRED WOERNER, CHAIRMAN

Mr. Chairman and Members of the Committee: Thank you for the opportunity to testify on our fiscal year 2000 Appropriation Request. The special nature of the

American Battle Monuments Commission places it in a unique and highly responsible position with the American people. The manner in which we care for our country's Honored War Dead is, and should remain, a reflection of the high regard in which we, as a nation, respect their service and sacrifice.

As you know, the American Battle Monuments Commission is a small, one-of-a-kind organization, that is responsible for commemorating the services of American Armed Forces where they have served since April 6, 1917 (the date of U.S. entry into World War I) through the establishment of suitable memorial shrines; for designing, constructing, operating, and maintaining permanent American burial grounds in foreign countries. In performing these functions, the American Battle Monuments Commission administers, operates, and maintains twenty-four permanent memorial cemeteries and twenty-seven monuments, memorials, and markers in the United States and fifteen countries around the world.

We have eight World War I and 14 World War II cemeteries located in Europe, the Mediterranean, North Africa and the Philippines. All of these cemeteries are closed to burials except for the remains of the War Dead who may occasionally be discovered in World War I or World War II battlefield areas. In addition, we are responsible for the American cemeteries in Mexico City, established after the Mexican War, and in Panama.

Presently, 124,914 U.S. War Dead are interred in these cemeteries—30,921 of World War I, 93,243 of World War II and 750 of the Mexican War. Additionally 5,857 American veterans and others are interred in the Mexico City and Corozal (Panama) American Cemeteries. Commemorated individually by name on stone tablets at the World War I and II cemeteries and three memorials on U.S. soil are the 94,120 U.S. servicemen and women who were Missing in Action, or lost or buried at sea during the World Wars and the Korean and Vietnam Wars.

We continue to provide services and information to the public, friends, and relatives of those interred in, or memorialized at ABMC cemeteries and memorials. This includes information about grave and memorialization sites as well as location, suggested routes, and modes of travel to the cemeteries or memorials. Immediate family members are provided letters authorizing fee-free passports for overseas travel to specifically visit a loved one's grave or memorial site. Photographs of headstones and sections of the Tablets of the Missing on which the service person's name is engraved are also available. These photographs are mounted on large color lithographs of the cemeteries or memorials. In addition, we assist those who wish to purchase floral decorations for placement at a grave or memorial site in our cemeteries. A photograph of the in-place floral arrangement is provided to the donor.

The care of these shrines to our War Dead requires a formidable annual program of maintenance and repair of facilities, equipment, and grounds. This care includes upkeep of 131,000 graves and headstones; 73 memorial structures; 41 quarters, utilities, and maintenance facilities; 67 miles of roadways and walkways; 911 acres of flowering plants, fine lawns and meadows; nearly 3,000,000 square feet of shrubs and hedges and over 11,000 ornamental trees. Care and maintenance of these resources is exceptionally labor intensive, therefore, personnel costs account for nearly 62 percent of our budget for fiscal year 2000. Some of this maintenance is performed by casual labor, in peak seasons, since the permanent cemetery staffs are not large enough to provide the required maintenance during the peak-growing season. The remaining 38 percent of our budget is required to fund our engineering, maintenance, utilities, equipment, and administrative costs.

As an organization responsible for permanent burial facilities, we do not have the option of closing or consolidating cemeteries. In light of this, we have increased our efforts to achieve greater efficiency and effectiveness, through automating and contracting, in the operational and financial management areas, where we do have alternatives. This Commission recognizes and fully supports the efforts of the President and the Congress to improve efficiency, focus on results, and streamline the government overall.

During fiscal year 1998, we completed work on our second Strategic (FY 1999–2004) and Annual Performance Plans (FY 1999). We have subsequently forwarded copies to Congress and the Office of Management and Budget. We believe these plans provide our agency a comprehensive roadmap for the future.

During fiscal year 1998, as part of our Strategic Plan, and at the request of the Office of Management and Budget (OMB), we conducted the first comprehensive manpower study of our European and Mediterranean cemeteries since 1982. The study consisted of a review of current position descriptions and interviews with top management officials in our Paris and Rome Offices, cemetery superintendents, foreman, guides, and most key personnel such as equipment mechanics, masons, gardeners, and others.

This study will help us define the manpower requirements for each of our cemeteries. To ensure that we are taking advantage of streamlining opportunities from additional outsourcing and automation and to maintain productivity and efficiency incentives, ABMC and OMB will jointly review the manpower survey. This review will consider the changing capital /labor ratio regarding the work week and employee standards. We will develop a comprehensive long-term automation, employment, and funding plan. We will also undertake a joint study to determine if automation, technology, and outsourcing improvements can reduce the growing costs of foreign employment.

In line with the study, the Office of Management and Budget has approved the addition of two positions, a personnel specialist for the agency, who will be located in our European Regional Office, and a systems accountant for our Headquarters Office.

In 1996, Congress specifically directed (Public Law 104-275) that ABMC prepare agency-wide financial statements annually beginning with fiscal year 1997, and that the financial statements be audited by the U.S. General Accounting Office (GAO) in accordance with accepted government auditing standards. Our first audit resulted in an unqualified opinion on our balance sheet, which is not normally earned on initial financial statement audits. We were one of the first agencies in the Executive Branch to "early comply" with the fiscal year 1998 accounting standards prescribed by the Office of Management and Budget in Bulletin No. 97-01, Form and Content of Agency Financial Statements. We have recently completed the second audit and are awaiting the results.

As I reported to you last year, we contracted with the Department of Treasury's Financial Management Services Center regarding the replacement of our accounting system. During fiscal year 1998, we selected a new system which will be implemented in March of this year. Implementation of this new, single and integrated accounting system will resolve a long-standing problem of non-integrated systems.

With our initial success in auditing and the implementation of a new financial system, we expect ABMC to achieve a higher level of management excellence in the next two to three years.

During fiscal year 1998 a large part of our focus was on the World War II Memorial. President Clinton unveiled the winning design by Friedrich St. Florian at a White House ceremony on January 17, 1997. Since that time, reviews by the Commission of Fine Arts (CFA) and the National Capital Planning Commission (NCPC) have resulted in the requirement to modify the design to more appropriately fit the Rainbow Pool site. On April 7, 1998, the ABMC forwarded Professor St. Florian's revised design concept to the CFA and the NCPC for their consideration and approval. On May 21, 1998, in a public hearing, the CFA unanimously and enthusiastically approved the location, site plan, and revised design concept. On July 9, 1998, in a public hearing, the NCPC approved the revised design concept of the World War II Memorial.

Our National Capital Campaign Chairman, former Senator Robert Dole, and our Co-Chairman, Mr. Fred Smith of Federal Express, continue to work diligently to raise the \$100 Million required for construction of the Memorial. The introduction of new films, e.g., *Saving Private Ryan*, has substantially raised awareness of the sacrifices of the WW II generation and the planned recognition through the National World War II Memorial. Mr. Tom Hanks, star of *Saving Private Ryan*, has volunteered his support to the World War II Memorial Project's Public Service Advertising (PSA) Campaign. He will be featured in television, radio, and print public service ads. Distribution of these PSA's is scheduled to run for two years beginning in March 1999 and continuing through 2000. In addition, prominent corporate and public sector leaders have been enlisted to assist with the solicitation and advocacy process.

ABMC faces several significant challenges concerning the World War II Memorial. Our greatest challenge is to collect private contributions to ensure that construction is completed so that as many of the World War II generation as possible will live to see and be honored by the Memorial. Our goal is to break ground for the Memorial in the year 2000. However, this is dependent on our ability to raise the required funding by the year 2000.

To respond to these challenges, the ABMC is proposing legislation which would extend the authorization to fiscal year 2005 in order to obtain a construction permit and develop the Memorial. The current authority on the Memorial's construction permit lapses in May 2000. In addition, the legislative proposal allows ABMC the necessary intellectual property authority, confirms ABMC's authority to accept voluntary services in furtherance of the activities of the Commission, and permits future acceptance of funds. The Office of Management and Budget advises that, from

the standpoint of the Administration's program, there is no objection to the presentation of this proposal for the consideration of Congress.

While our attention has been focused on management improvements and the design and construction of the World War II Memorial, we have not ignored our primary mission of operating and maintaining twenty-four memorial cemeteries and twenty-seven monuments, memorials, and markers.

The Congress has been instrumental in our success in maintaining a high standard of excellence by providing the funds required to accomplish our objectives. The additional funding of \$3 Million in fiscal year 1998 and \$2.5 Million in fiscal year 1999, for engineering and maintenance projects, allowed us to significantly reduce our backlog of essential projects. We have grouped together certain types of projects, such as sprinkler systems, replacement of fuel tanks, and repair of roadways and walkways, in order to achieve economies of scale. Grouping these projects by region has and will allow contractors to consolidate bids and provides ABMC with the most cost-effective use of managing available resources.

Our fiscal year 2000 request provides \$3.0 Million for engineering and \$1.3 Million for maintenance projects which will allow us to continue to reduce our backlog of projects. In addition, our request provides for cost of living increases for our U.S. and foreign national personnel, funding to develop a maintenance data base, establishment of an information systems contract, the addition of two FTE previously mentioned, and the OMB suggested studies of our personnel survey and capital improvement plans. We have focused our fiscal year 2000 program to ensure we accomplish these essential high priority projects.

For the third year, in agreement with the Office of Management and Budget, we have repriced our budget to conform to the Fiscal year 2000 foreign currency rates established for the Department of Defense.

Since 1923, the American Battle Monuments Commission's memorials and cemeteries have been held to a high standard in order to reflect America's continuing commitment to its Honored War Dead, their families, and the U.S. national image. The Commission intends to continue to fulfill this sacred trust while ensuring the prudent expenditure of appropriated funds.

The American Battle Monuments Commission appropriation request for fiscal year 2000 is \$26,466,526.

This concludes my prepared statement. I will be pleased to respond to your questions.

CHEMICAL SAFETY AND HAZARD INVESTIGATION BOARD

JUSTIFICATION

GENERAL OVERVIEW

Mission.—The Chemical Safety and Hazard Investigation Board's (the Agency) mission is to reduce the occurrence of chemical incidents, thereby protecting workers, the public and the environment and lessening associated economic consequences. The Agency's major responsibilities include: (1) conducting chemical incident-related investigations under the Clean Air Act Amendments of 1990; (2) providing the Congress and the President with independent, expert fact finding and technical advice to assist in the development, implementation and evaluation of chemical safety policy and government-wide resource allocation decisions; (3) performing statutory responsibilities pertaining to chemical safety-related matters, ranging from special studies and analyses to quasi-legislative functions (e.g., recommending operational improvements in federal chemical safety programs within the Occupational Safety and Health Administration, the Environmental Protection Agency, and other organizations); (4) responding to requests for information from the Congress and the President on various matters affecting chemical safety; and (5) providing technical information and assistance to government, business and industry on causes of and ways to prevent chemical incidents. To carry out these responsibilities and to improve the current picture of chemical safety, the Agency must maintain the highest level of expertise.

Challenges.—The Agency first opened its doors in January 1998, with the need to address a full range of both the most basic organizational and the most sophisticated mission-specific requirements. For fiscal year (FY) 1998, the Agency had a \$4 million budget and an authorized staffing level of 20 full-time equivalent employees (FTE's) to begin building a new independent federal agency from the ground up. The Agency began without any inherited infrastructure, personnel, agency-specific policies or procedures, space, or other fundamental resources. Nevertheless, by the end

of September it had two of its five Presidential-appointed Board Members, had hired the annual full-time equivalent (FTE) of 5 employees, and had prioritized use of its resources to initiate development of the most critical baseline operations. One key baseline operation involved measuring the scope of the national chemical incident problem, which had not before been attempted by any organization. The importance of this effort was emphasized to the Agency during a February 1998 meeting between Agency staff and representatives from a variety of offices within the General Accounting Office (GAO). The GAO recommended the Agency focus on the results it was established to achieve. The GAO said “rather than focus on the number of accidents CSHIB plans to investigate, or the number of reports it plans to review, [we] suggest focusing on the results of doing this work, such as preventing or eliminating accidents shown by the analysis of data trends. . . . it will take time to see some of the results of these actions and the board needs to begin by establishing a baseline.” The Agency followed this advice and, by the end of fiscal year 1998, had plans in place to assess federal data on the scope of the chemical incident problem.

Structure.—The Agency’s business plan, prepared in 1997, serves as the overall strategic plan for building the Agency during its formative years. This is supplemented with complementary, functional-level strategic plans and operating procedures subsequently developed to shape and support specific program activities. By fiscal year 2001 the business plan will be replaced by a GPRA-compliant, agency-wide strategic plan, to be prepared in fiscal year 2000. Agency growth from nascent to functional level was originally scheduled to occur over a three-year period (fiscal year 1998–fiscal year 2000), during which time the staff would develop the knowledge, infrastructure, and programs that would permit the Agency to function as a mature organization. This timeline now has been extended to four years (fiscal year 1998–fiscal year 2001) as the result of a better assessment of the effort required to reach full operational capability. The Agency’s intent, based on its concept of operations, is to grow to an estimated staffing level of 100 FTE’s by fiscal year 2002, and its organization and staffing reflect this plan. The Agency is a flat organization with only a single layer of management. It acquires, to the maximum extent possible, and has its staff manage requisite administrative and technical services from outside sources. The reasons for this mode of operation are the use of FTE’s to provide administrative services reduces the number of staff available for technical, mission-related duties. Also, because chemical incidents occur in such diverse industries under a wide variety of circumstances, the Agency cannot have individuals on staff with technical expertise on all subjects that could be factors in all possible chemical incidents. As a result of these constraints, the Agency will continue to contract for or otherwise obtain (e.g., through interagency agreements) the expertise as needed for specific investigations and other programmatic activities.

Resources.—In fiscal year 1999, the Agency budget grew to \$6.5 million for 12 months of operation from the \$4 million appropriated for and expended over nine months of operation during fiscal year 1998, and its authorized staffing level increased from 20 to 30 FTE’s. The Agency requests \$12.5 million for the necessary expenses to carry out its mission and meet its goals during fiscal year 2000. This represents a \$6 million increase from the fiscal year 1999 funding level, and is \$5 million above the \$7.5 million requested in the President’s fiscal year 2000 Budget. The \$12.5 million request will allow the Agency to continue moving from a startup to a fully operational federal agency. The Agency has learned through its efforts to date that the volume, scope and complexity of its work is greater than purported by others. Nevertheless, the Agency has limited its budget request to ensure the fiscal year 2000 increase is consistent with the growth projected in the Agency’s business plan, which was submitted to Congress, the Office of Management and Budget (OMB), and the GAO. Judicious use of government contracting opportunities (i.e., buying, not building capabilities) have already enabled the Agency to realize significant savings over more traditional operating strategies. Through continued use of these alternative venues, the Agency expects to be able to meet its fiscal year 2000 goals in a cost-effective manner.

BUDGET APPLICATION

The Agency requests \$12.5 million to accomplish the work planned for fiscal year 2000. Funding at this level will allow the Agency to continue its development by hiring additional staff, providing the concomitant needs for space, equipment and supplies, and contracting for requisite services. We note that OMB elected to arbitrarily reduce this request by \$5 million, in spite of statutory language regarding the independence of the Agency [42 U.S. Code § 7412 (6)(R)]. If the Agency’s request is reduced by \$5 million, it will not be able to grow because most of the \$1 million increase over the fiscal year 1999 budget level will be used to fund mandatory in-

creases. The following are the significant consequences that will result if the Agency's budget request is reduced to \$7.5 million.

- The Agency will not be able to hire any new employees. As a result, the planned increase in the investigative workload will not be realized.
- The studies on chemical incident reporting and on federal chemical incident prevention programs, designed to determine ways to improve program performance and to reduce costs and burdens on government and business, will be delayed due to lack of staff to execute these projects.
- Development of technical guides and educational materials for industry and other stakeholders will not occur.
- The Agency will curtail efforts to develop technical training programs for its staff to help them perform their various technical duties (e.g., conduct investigations, review others' investigative reports, and plan and manage special studies).
- No further information technology development work in support of the Agency's mission will be funded. For example, the Agency uses the Internet to disseminate information about chemical safety and prevention. Without sufficient funding, work will not continue enhancing the information-sharing process the Agency began in fiscal year 1999. In addition, the Agency will not develop a program to collect "near miss" information from industry (similar to what the aviation industry voluntarily provides to help prevent aircraft incidents).
- The ten-year consolidated incident database will not be expanded through the planned annual inclusion of new (e.g., the prior year's) incident reports and additional types of available government data. Failure to keep this database current, and to expand the depth of the information it contains, will prevent this resource from being used by the Agency for operational planning and evaluation purposes, and by Congress to evaluate agencies' performance and budget requests, adjust laws and the federal chemical safety system, reduce costs and otherwise improve effectiveness, and to track progress in addressing the problem of chemical incidents.

BUDGET UTILIZATION

Incident prevention

One of the Agency's primary responsibilities is to conduct chemical incident-related investigations under the Clean Air Act Amendments of 1990. These investigations result in reports addressing the nature, causes and recommendations for preventing incidents. The ultimate goal of the investigation activity is to persuade those to whom safety recommendations are directed to implement these recommendations. Incident examinations, which are conducted pursuant to Section 112(r)(6)(C)(i) of the Clean Air Act Amendments of 1990, may take the form of either field investigations or reviews of work done by others. Each incident is unique. Extensive time must be devoted to researching and verifying all aspects of the incident, waiting for production of documents by the company and other investigative authorities, and conducting analyses of evidence. Depending upon the complexity of the incident, availability of documents, and other matters that may impede progress, a report may take 9 to 12 months to complete.

The Agency learned in its first year of conducting investigations that a variety of personnel are required on a field investigation team to ensure the effectiveness of each phase of the investigation. For each investigation, we assign at least one staff member from the Offices of Investigations, Safety Programs, General Counsel, and External Relations, for a total Agency investigation team of four or more staff members. These teams are responsible for the activities outlined below.

Office of investigations

- Establishing and operating the field command center, which provides assistance to investigators by obtaining documents, scheduling witness interviews, maintaining technical communication with Agency headquarters, and otherwise supporting the investigative work.
- Compiling business and technical details about the company involved in the incident, previous incidents within the same industry or involving similar circumstances.
- Surveying the incident site, determining the scope of the investigation, and working with local jurisdictional officials to secure the incident scene and to assure that evidence is not jeopardized. Coordinating Agency and contractor personnel at the site.
- Ensuring the investigation is conducted in accordance with Agency policy, and that methods and techniques are used that will promptly and effectively iden-

tify pertinent facts, conditions or circumstances surrounding the accident and result in the timely completion of the field phase of the investigation.

- Developing and preparing documentation from the incident including reports, photographs, records and other relevant material. Determining requirements for special tests, studies and assistance that may be necessary for one or more aspects of the investigation.
- Reconstructing incident dynamic and sequence of events; determining the authenticity and adequacy of data; examining the reported facts, conditions and circumstances of the incident and their relationship to determination and support of probable cause; assuring that analyses are consistent with applicable scientific, technical and engineering methods and standards.
- Preparing the formal incident report in accordance with Agency policies, procedures, and technical requirements, and defending the report's contents, conclusions, and recommendations at formal Board meetings.

Office of safety programs

- Crafting sound recommendations based on the comprehensive evaluation of what caused the incident. The recommendations are based on the best scientific solutions to prevent a reoccurrence and must be feasible to implement.
- Identifying appropriate audiences to which recommendations should be addressed.
- Developing and implementing a tracking system to ensure recommendations are closed.
- Evaluating the long-term effectiveness of recommendations.

Office of general counsel

- Obtaining access for Agency investigators to incident sites, company employees and documents.
- Resolving legal issues with law enforcement and other responding local, state and federal agencies.
- Working with attorneys from the company involved, as well as attorneys representing other interested parties, to resolve matters so the investigation process proceeds efficiently and effectively.
- Working with Agency investigators to share draft reports, including the confidential business information, with the company's attorneys.
- Processing Freedom of Information Act requests and other civil litigation matters, which invariably follow chemical incident investigations.

Office of external relations

- Establishing incident-driven external-relations operations in the field and at headquarters.
- Serving as a liaison and source of information to local, state and federal officials, industry, labor and the public.
- Identifying organizations (governmental and non-governmental) to be informed of the Agency's reports and recommendations.
- Arranging for the broadest possible dissemination of reports; arranging for articles, op-ed pieces, editorials and other published materials that support acting on Agency findings.
- Responding to questions about Agency actions; monitoring communications media for evidence of action in response to Agency recommendations; making presentations (or supporting presentations by others) on Agency findings and recommendations.

In addition to the Agency investigation team, the Agency acquires external support for investigations. Sources of this support include other federal agencies, the Department of Energy's National Laboratories, private contractors with specialized technical expertise, and private laboratories. The Agency also uses contracted support for technical writing and graphic design of our reports. An average of four contract staff are used for an investigation.

Due to the complexity of chemical processes, the technical and legal issues involved in unraveling every incident, and the sheer quantity of chemical incidents that occur annually, the Agency carefully screens chemical incidents to decide whether to undertake an investigation. The Agency usually conducts an initial assessment of the incident to determine whether a field investigation is warranted. Factors considered include whether: (1) commonly used chemicals or processes are involved, (2) hazards of the chemical or the process are not apparent, (3) regulatory coverage is lacking, (3) the industry sector is large or is growing, (4) the process or operation involved is labor intensive, (5) state or local agencies, or safety organizations have specifically requested Agency involvement, and (6) the industry is aware of and committed to chemical safety and incident prevention.

The Agency is an independent, scientific, nonregulatory organization. As a result, its investigations differ from those conducted by other federal organizations in their focus, depth, purpose and outcome. The Agency is not limited to examining incidents involving only certain industries, chemicals or processes. Rather, it selects for investigation those incidents which appear will provide the widest audiences with the most useful information on causes of and means of preventing chemical incidents. As the Agency is precluded by law with finding fault, matters of regulatory compliance and punitive actions are outside its investigative purview. Instead, it seeks to determine the root causes of incidents in order to develop recommendations aimed at improving safety and preventing future incidents. These recommendations may be targeted at private industry, government bodies, professional associations or any other organization in a position to implement the recommendations. The Agency's investigations result in objective, technical reports, not enforcement actions and fines. The Board-approved reports cannot, by law, be used in civil litigation, a fact which encourages companies to cooperate fully with the Agency as it conducts its investigations. The Agency disseminates its reports to key federal, state and local government entities, specific companies and industries, safety professionals, first responders, trade associations, and the general public.

No one can say with certainty what the demographics (e.g., size, characteristics, cost to the economy) are of the annual universe of United States chemical incidents. Therefore, any assertions as to these factors are suspect and cannot be relied upon with confidence. The Agency's preliminary findings from its study of 10 years of incident data reveal that the numbers, just for incidents resulting in one or more deaths, are far greater than the Agency could hope to investigate. Annually, an average of 127 incidents occur that result in at least one death. In fiscal year 2000 the Agency will continue to examine a select number of incidents to continue to expand its first-hand knowledge about problems, but will devote at least equal attention to alternative strategies for bringing about change.

In fiscal year 1999, the Agency initiated work, to continue in fiscal year 2000, on development of the federal government's first comprehensive national database of chemical incidents. As emphasized by the GAO, absent this resource and the baseline it establishes, there is no objective way to determine the scope, nature or change in the chemical incident picture within the United States. There is no objective way to determine how best and at what level of effort to apply the Agency's (and the totality of the federal government's) resources to address the problem posed by chemical incidents, or how to devise and implement meaningful prevention strategies. Consequently, there is no way to establish and report on performance measures required by Congress under the Government Performance and Results Act. Representatives from the GAO endorsed, as an efficient use of government resources, the Agency's plan to develop a baseline using information contained in databases already developed by other agencies. The GAO noted that when using data from different sources, it is important to recognize that both data comparability and data reliability are key issues to address.

For this function the Agency projects the use of 24.2 workyears and \$5,493,000 in direct costs in fiscal year 2000, compared to 10.7 workyears and \$2,421,000 in fiscal year 1999.

Safety studies

These are discrete activities to support specific program operations within the Agency or develop products and services for stakeholders to assist them in improving chemical safety. In fiscal year 2000 the focus of the work under this function will be on technical training for Agency staff and assessment of the effectiveness of federal chemical safety programs in contributing to attainment of the government's goal of eliminating chemical incidents.

Currently, available technical training dealing with investigation of chemical incidents does not address with specificity matters within the purview of the Agency, i.e., how to identify root causes of incidents and design recommendations to correct those causes. The vast number of industries and their varied operations complicate the process of conducting investigations and make it imperative that Agency investigators have available to them the training and references needed to understand the facility at which an incident has occurred. By developing training for Agency staff, materials also become available for industry use, which may assist in identification of problems before they lead to incidents. Agency training materials are to be multi-dimensional and multi-purpose, designed for use both in the office as an educational tool and at an incident site as a reference tool. These materials will provide technical treatment of pertinent laws, regulations, industry standards and current safety research, and checklists and other aids to guide and assist in the conduct of an investigation. In fiscal year 2000 the Agency intends to develop targeted

training for its staff, focusing on particular technical issues and on the process of conducting an investigation and writing reports. It also intends to develop training on human factors, in order to address issues noted by the Congress in the Agency's legislative history: "... special emphasis should be put on expertise in "human factors" and the role that operator failures play in causing accidents. In other fields, the United States has fallen behind the international community in the use of operator training and the development of operating and emergency procedures to prevent accidents and minimize their consequences." [Senate Report No. 101-228 (1989); Page 229]

The Agency is required by law to provide Congress and the President with an annual report that addresses, among other matters, recommendations for legislation or regulatory changes. Congress further suggested the Agency "... may issue more general reports to the Congress and make recommendations to other Federal or State or local agencies and to owners and operators of facilities engaged in chemical production or handling to suggest measures that might be taken to improve the safety of operations." [Senate Report No. 101-228 (1989); Page 235] In addition to issuing formal reports, Congress suggested in the legislative history that the Agency "... may also serve as a point of communication among the various Federal agencies to improve the effectiveness of accident prevention programs and reduce the burden of duplicative requirements on regulated entities." [Senate Report No. 101-228 (1989); Page 208] In order to offer sound recommendations for improving the performance, streamlining the operation and reducing the cost of the federal government's chemical safety programs, the Agency first needs an in-depth understanding of the various programs. To gain this understanding, in fiscal year 2000 the Agency will initiate a comprehensive, multi-phase study of the federal government's chemical safety system. The Agency will issue reports to Congress and other appropriate parties that contain findings and any recommendations for improving the system and the coordination between the federal agencies involved with chemical safety. The Agency also intends to undertake a study of the economic cost of chemical incidents to industry, state and federal government, and other definable entities.

For these activities the Agency projects the use of 1.9 workyears and \$417,000 in direct costs in fiscal year 2000, compared to 1.0 workyears and \$211,000 in fiscal year 1999.

Information dissemination

The main product of the Agency is chemical safety information. Chemical safety information includes not only the safety recommendations generated from incident investigations, but also various other types of safety information—data, operational guidance, technical references—that exist throughout the commercial and government sectors, or that will be developed by the Agency. The information will help a variety of stakeholders make decisions about chemical safety, e.g., the Congress and federal agencies, corporate management, workers, communities, first responders and safety professionals.

The intended repository of and distribution point for information is the Agency's safety information center. A variety of products, accessible via the World Wide Web and other venues, will be available from the center to assist stakeholders in improving safety and reducing the number of incidents. The Agency's web site, designed to serve as an entry point to the center, already is serving a large and varied domestic and international clientele in both the public and private sector. It provides more information on what is currently happening relative to chemical safety than has ever been available on a real-time or near-real-time basis in one place before. The regularity with which the Agency's web site is consulted is evidence of the desire for and interest in a centralized center, where safety professionals can share information, benchmark their safety practices and the safety of their technologies, and locate safety-related references and statistics.

In fiscal year 2000 information dissemination efforts will more formally identify and begin to satisfy needs for chemical safety information. As part of this initiative, the Agency will broaden the depth and breadth of Agency interactions and communications with external audiences and expand the availability of electronic information via the Internet. The Agency will for the first time devote one full-time equivalent position to supporting the content development tasks associated with the Agency's World Wide Web site. Content development in fiscal year 1998 and fiscal year 1999 was handled solely as additional duties by other staff. As the Agency has developed significantly more original materials and has engaged in significantly more interaction with external parties, the content development workload has exceeded the ability of staff to keep pace. In addition, the development of large databases, investigation reports and recommendations, and special studies requires cor-

responding Internet-specific platforms, and information technology staff to develop, support, and administer the databases and web site.

In fiscal year 2000 the Agency will continue building the nation's primary repository of chemical safety data, which is modeled after the Federal Aviation Administration's National Aviation Safety Data Analysis Center. Chemical safety data will be used by the Agency in decision-making, resource allocation, and to support investigative and safety program analyses. Chemical safety data will also be available to our stakeholders. However, many of the repository's source databases from other government agencies contain incomplete and sometimes inaccurate historical incident data. Moreover, even similar data from different sources are inconsistent due to confusing and often contradictory regulatory reporting requirements. To build and use the chemical safety data repository, and to effectively disseminate information to the Agency staff and stakeholders, the information technology operations require additional staff to identify data sources, and to acquire, manage and analyze the data.

Another critical information dissemination function is the monitoring of chemical incident reports received from a number of real-time sources, such as the U.S. Coast Guard's National Response Center and commercial news wire services. This information plays a role in deciding whether to conduct an investigation. In fiscal year 2000 the Agency plans to produce, for publication on its web site and inclusion in its incident database, short synopses of incidents based on this information. In this way the Agency expects to compile incident details that may be searched for insight into causes of those incidents not investigated due to resource constraints. The Agency also expects to design in fiscal year 2000 a voluntary, confidential reporting program on "near miss" events (similar to the one developed for use by the aviation industry and operated by NASA for the FAA) that provides early warning of conditions that may lead to actual incidents.

Information dissemination activities also are intended to comply with several government-wide mandates. For example, the Agency must inform Legislative and Executive Branch members, and the taxpayers, about its routine and non-routine activities. At a minimum, such notification occurs via the Agency's Annual Report and budget materials it submits to the Congress.

For information dissemination activities, the Agency projects the use of 11.1 workyears and \$2,723,000 in direct costs in fiscal year 2000, compared to 5.6 workyears and \$1,342,000 in fiscal year 1999.

Board members

In fiscal year 2000, it is anticipated the Agency's five-member Board will, for the first time, be fully staffed for an entire fiscal year. The Board Members are Presidential appointees whose salaries are set by law. The Board Chairman manages the Agency in his concurrent role as its Chief Executive Officer. The Board was established by law to perform a technical review and vote on release of investigation reports and recommendations prepared by Agency staff. Board Members may also pursue personal projects of interest to them in the field of incident prevention, may be called upon by Agency staff for expert assistance in addressing specific Agency concerns, and may perform outreach services on behalf of the Agency at the CEO's request.

For this function the Agency projects the use of 4.5 workyears and \$1,325,000 in direct costs in fiscal year 2000, compared to 3.6 workyears and \$1,002,000 in fiscal year 1999. We note that workyears are projected to be 4.5 in fiscal year 2000, because the Chairman's time is split between activities performed as a Board Member and as Chief Executive Officer.

Executive direction

These are general management activities (e.g., developing the Agency's strategic plan, and evaluating Agency-wide operations) performed by the Agency's Chief Executive Officer, the Chief Operating Officer, the Executive Officer (responsible for execution of administrative functions), and individuals responsible for directing the work of the Agency's program offices.

For this function the Agency projects the use of 1.8 workyears and \$503,000 in direct costs in fiscal year 2000, compared to 2.1 workyears and \$537,000 in fiscal year 1999.

Indirect costs

This encompasses all administrative operations (human resources, finance and budget, and management services), whether performed by Agency staff or by public or private sector vendors operating under their direction, and all activities pertaining to installation and maintenance of the Agency's information technology infrastructure. It also includes time devoted by staff to develop written procedures

for Agency activities such as contracting, and time devoted to general Agency-wide activities, such as regularly scheduled briefings for Board Members to keep them aware of work being performed by the Agency.

These activities also include work benefiting the entire Agency, such as provision of legal services. This is a new agency with unique statutory provisions. It is continually faced with complex, novel legal issues that it must resolve. In many legal areas, such as the Agency's authority to compel companies and other agencies to cooperate with it, there are no precedents. In addition, because this is a new agency, it has no legal structure in place to assist it in complying with the various federal laws. For example, the Agency still has not published in the Federal Register any regulations, directives, orders, or other institutional documents to guide its activities. Consequently, it needs lawyers to draft and promulgate these comprehensive documents. Finally, the Office of General Counsel serves as advisor to the Chairman of the Agency and assists in providing advice to concerns raised by specific Board members. As the five-member Board becomes fully functional, additional legal time will be necessary to meet their demands.

These activities also include work undertaken by that person serving as the Agency's Inspector General. That individual is responsible for directing and carrying out financial and management audits of the Agency's operations, and for reviewing and commenting on proposed procedures and other documents regarding their economy, efficiency, and effectiveness. In fiscal year 1999 financial statements for the Agency's first year of operations (fiscal year 1998) were produced, and it is anticipated that in fiscal year 2000 this work will be expanded to address the Agency's system of records, internal control procedures, policies for marking and controlling sensitive data, and the ability to report on performance measurement goals.

In addition, the Agency must acquire appropriately configured, permanent office space. The Agency has grown from an onboard staff of 15 employees at the end of fiscal year 1998 to a current level of 27 employees. The Agency plans to hire an additional 30 FTE's in fiscal year 2000, and to have 100 FTE's by fiscal year 2002. It was not cost-effective or even financially possible to enter into a long-term lease for space that could accommodate the needs of a 100-employee agency when the Agency was staffed with only a few employees. Accordingly, the Agency leases temporary space to accommodate the startup staffing levels. In fiscal year 2000, the Agency will locate and prepare its permanent office space. Build-out costs to prepare the space include standard expenses incurred by the government in preparing space for occupancy (architectural design services and space alterations). It also includes creation of such technology infrastructure to support the Agency as fiber optic network wiring, primary uninterruptible power supply (UPS) installation, air conditioning, and specialized electrical wiring to support the infrastructure.

The Agency projects the use of 8.5 workyears and \$2,039,000 in fiscal year 2000, compared to 3.8 workyears and \$987,000 in fiscal year 1999 for the indirect cost category.

CONSUMER PRODUCT SAFETY COMMISSION

PREPARED STATEMENT OF ANN BROWN, CHAIRMAN

Mr. Chairman, and members of the Subcommittee, I am Ann Brown, Chairman of the U.S. Consumer Product Safety Commission (CPSC).

I am pleased to have this opportunity to testify in support of our fiscal year 2000 appropriation request. The modest increase in our budget to \$50.5 million, the establishment of a small, carefully targeted, applied research program and other initiatives assure the Agency will continue on the effective path we have followed for the past five years.

Before I begin my testimony on our budget, I want to give you a quick update on the two tasks given us by the conferees on our fiscal year 1999 appropriations. As you will recall, Section 423(a) of the Conference Report directed us to contract with the National Academy of Sciences within 90 days, for a 12-month study of the potential toxicologic risks of all flame-retardant chemicals identified by the NAS and the Commission as likely candidates for use in residential upholstered furniture. These chemicals could be used to comply with our draft proposed regulations for flame resistance of this furniture. We entered into the contract with the NAS prior to the deadline on January 15 of this year.

Section 429(a) of the Conference Report directed us to propose for comment within 90 days, a revocation of the amendments to the children's sleepwear standard previously issued on September 9, 1996. FR Vol. 61, No. 175, p. 47634 et. seq. The pro-

posed revocation was published in the Federal Register on January 19 of this year, which was also prior to the deadline.

Section 429(c) directed us to promulgate a final rule revoking, maintaining or modifying these latest sleepwear amendments by July 1, 1999. We will complete that assignment on time.

AWARDS FOR INNOVATIONS

The Commission has recently received two prestigious awards for innovations in the way we carry out our work. The first award for innovation is from the Ford Foundation, the Council for Excellence in Government and the JFK School of Government, which administers the awards program. Last year, CPSC was chosen from over 1,400 entries as one of 10 winners of the 1998 Innovations in American Government Award. We received the award for our Fast Track Product Recall Program. With this new program we are seeing dangerous products removed from store shelves more quickly and three times as many returned as with a regular product recall—without a preliminary product defect against a company.

The second award was from the Institute for Dispute Resolution, which honored us for our innovative use of mediation in carrying out a recall of defective high temperature plastic vent pipes, that are part of certain furnaces and boilers, which could leak deadly carbon monoxide. Instead of lengthy and costly litigation involving many companies, CPSC employed the services of an experienced mediator who persuaded the companies to accept a program to replace the dangerous pipes at no cost to consumers.

These two awards from highly respected organizations demonstrate that CPSC is an innovative, effective organization that performs its work in a praiseworthy manner.

FISCAL YEAR 2000 BUDGET

Despite the progress in product safety in recent years, there are still an average of 22,000 deaths and 29.5 million injuries annually due to unsafe consumer products. These deaths, injuries and associated property damage cost the nation about \$400 billion a year.

To carry out the second year of our six year strategic plan to reduce further the number of deaths and injuries and property damage, we propose a budget of \$50.5 million for fiscal year 2000.

As you will recall, last year we set forth and discussed in detail our eight strategic goals. They are:

- Reduce the head injury rate to children from consumer products by 15 percent.
- Prevent any increase in the death rate from poisonings to children.
- Reduce the death rate from fires by 10 percent
- Reduce the death rate from carbon monoxide poisonings by 20 percent.
- Reduce the death rate from electrocutions by 20 percent.
- Increase public contacts through the Worldwide Web by 500 percent and through the Consumer Product Safety Review by 200 percent. Maintain capability to handle 250,000 Hotline calls annually.
- Attain 85 percent success with services CPSC provides industry through the Fast Track Product Recall Program, and 80 percent success in the Ombudsman Program.
- Sustain the current satisfaction of consumers with CPSC's Hotline and Clearinghouse, and sustain the states' satisfaction with CPSC's State Partners Program at 90 percent or better.

This year we have restructured our budget to more closely reflect our goals in these specific areas. Previously, we organized our budget along functional lines. Thus, compliance, consumer information, hazard assessment and reduction and agency management were each separate categories.

In our new format we have just two categories, reducing product hazards to children and families and identifying and researching product hazards. There are four activity areas included in the first category.

- Children's Hazards
- Fire and Electrocution Hazards
- Household and Recreation Hazards
- Child Poisoning and other Chemical Hazards

RESEARCH BUDGET

There are two activity areas in the second category:

- Hazard Identification and Analysis
- Applied Product Hazard Research

For the first time this year, we are proposing a separate, specific research budget. We have always done some product research, when funds were available. Section 5(b)(1) of the Consumer Product Safety Act specifically authorizes the Commission to "conduct research, studies and investigations on the safety of consumer products and on improving the safety of such products."

Our proposal is supported by the recent report of the highly regarded National Academy of Sciences Institute of Medicine. After reviewing the Commission's performance in recent years, the report concluded:

"The committee believes that the CPSC is on the right course, relying heavily upon cooperative efforts with industry to raise prevailing standards of safety . . . the committee believes the agency's capacity to carry out this strategy needs to be strengthened by increasing its resources for . . . applied research." Report p. 215-216.

The committee recommended that research funds be used "to enhance the CPSC's capacity to study safety problems and stimulate product innovations, examine the feasibility and efficacy of safer product designs and proposed safety standards and develop and test methodologies for setting performance standards and for monitoring compliance with such standards." Report p. 217.

One of the research projects we are considering could improve the safety of certain House office buildings. In a compliance investigation last year, we found that certain fire sprinklers, like those in the House office buildings, are defective. Accordingly, they have been recalled, by the manufacturer with an offer of free replacement. We have been unable to obtain any information about defects in the sprinklers in the Senate office buildings, because the Architect of the Capitol has not responded to our requests for such information. If you grant our research request, one of the projects we are considering is an investigation into the adequacy of existing fire sprinkler standards. We would study the reliability and performance of these products to determine what improvements are needed.

INFORMATION TECHNOLOGY AND OTHER PROGRAM INITIATIVES

In recent years we have repeatedly stressed to you our need for improvements in our information technology. We do so again this year. As a data-driven agency, we must strengthen the tools we use to identify and analyze product hazards if we are to continue making sound risk-based decisions. CPSC requests \$500,000 for an integrated hazard database. This is a key improvement because it will speed up hazard analysis and investigations.

We further ask an additional \$355,000 to fund various initiatives that strengthen the agency's ability to reduce death and injury to children and those resulting from fire and electrocution hazards, household and recreation hazards, and child poisonings and other chemical hazards. Some of these initiatives include oversight of the all-terrain-vehicle (ATV) industry safety program, the distribution of safety information to the nation's families through pediatricians, the purchase of laboratory testing equipment, expanded consumer Hotline services, and an additional safety video news release.

The balance of the additional request, \$2.1 million, is to maintain the agency's current safety effort at 2000 prices. The \$2.1 million will fund projected increases for salaries and benefits of \$2 million and General Services Administration estimates for space rent increases of \$126,000. These costs are outside the control of CPSC. CPSC did not increase our office space; the increase represents the GSA allocation of cost increases GSA projects it will need to operate the Federal office space program in 2000.

The National Electronic Injury Surveillance System (NEISS) is the foundation for Commission efforts to collect information on product-related injuries. NEISS provides estimates of the frequency and severity of product-related injuries treated in hospital emergency rooms. In fiscal year 2000, CPSC is planning to expand the NEISS, which is currently limited to consumer product injuries, to include all injuries. This will be done in partnership with other Federal health and safety agencies at no additional cost to CPSC. In its recent report on injury, the Institute of Medicine recommended that the federal government expand CPSC's NEISS to increase our knowledge of the causes and severity of nonfatal injuries. This endorsement of the NEISS is another example of the increasingly important role that CPSC plays in the injury-prevention community.

NEW PARTNERSHIP

In previous years I have told you about our partnership with Gerber Products and other companies to promote consumer product safety. I have recently announced a

new partnership with CNA, a major insurance organization based in Chicago. With CNA's support we are issuing today a new free brochure highlighting low-cost safety devices for making homes safer for young children: Childproofing your home: 12 Devices to Protect Your Children. Each year over 2.5 million young children are injured or killed in often-preventable incidents in their own home. This brochure will tell parents about safety devices that will help keep children safe in their homes. CNA Financial Corporation of Chicago has underwritten the costs of producing and distributing this colorful easy-to-read brochure that will be distributed free of charge by the Consumer Information Center. This is the kind of public/private cooperation that helps us get our life-saving information to the American public without regulation or red tape.

CPSC IS A COST EFFECTIVE AGENCY

Mr. Chairman, and members of the Subcommittee, we take great pride in the awards we have recently received. They inspire us to rededicate ourselves to the mission of our agency—keeping children and families safe.

As we prepare for our 26th year, I want to cite just a few of our accomplishments. We have played a key role in the 30 percent decline in the rate of deaths and injuries related to consumer products since 1973. During this time we have:

- Saved the nation about \$10 billion annually in health care, property damage, and other societal costs through past agency work on electrocutions, children's poisonings, children's cribs, power mowers, and fire safety. These savings are almost 200 times CPSC's request for 2000 or about \$200 million in savings for each \$1 million of the agency's request.
- Required cigarette lighters to be child-resistant. This action is expected to prevent over 100 deaths annually and provide net benefits of over \$500 million in societal costs.
- Reduced societal costs by about \$1 billion annually by working to curb carbon monoxide (CO) poisoning.
- Prevented about 50,000 injuries and reduced societal costs by over \$1 billion each year by removing dangerous fireworks from the marketplace.

These and other recent achievements are strong evidence supporting the conclusion of the Institute of Medicine report that CPSC is now "a model of regulatory efficiency."

Mr. Chairman, the \$50.5 million we are requesting is equal to about 1/1,000 of the \$400 billion annual cost of deaths, injuries and property damage caused by hazardous consumer products. Your approval of the full amount of our budget will be returned many times over in better health and safety for all American children and families.

COURT OF APPEALS FOR VETERANS CLAIMS

PREPARED STATEMENT OF HON. FRANK Q. NEBEKER, CHIEF JUDGE

Mr. Chairman and distinguished members of the Committee: On behalf of the Court, I present for your consideration the fiscal year 2000 budget of \$11,450,000 for the United States Court of Appeals for Veterans Claims. (The Court was renamed last year by the Veterans Programs Enhancement Act, §511, Pub. L. No. 105-368, 112 Stat. 3315, 3341 (1998), effective on March 1, 1999.)

The Court's fiscal year 2000 budget request includes \$910,000 requested by the Veterans Consortium Pro Bono Program (Representation Program). The Representation Program provided its own supporting statement to accompany its budget request.

The budget request of \$11,450,000 reflects a \$1,255,000 increase over the funding for Court and Representation Program operations appropriated for fiscal year 1999. The net increase for Court operations is \$1,210,000. This increase is based primarily on a request for funding of 8 full-time equivalent (FTE) positions, above the fiscal year 1999 authorized level of 80 FTEs, for a total of 88 FTE positions. This funding would permit the Court to hire a third law clerk for each judge and an additional staff attorney in the Central Legal Staff (CLS). The additional personnel are needed, in response to a sharp increase in the number of cases filed in the Court during the last two years, to prevent the backlog of cases from growing further and causing dramatic delay in the resolution of veterans' appeals.

As background for the current situation, I will give you a quick synopsis of the Court's caseload history. The Court began operations on October 16, 1989. The number of new cases filed in the Court fluctuated substantially during the first few years, and leveled off at slightly more than 1,200 per year by fiscal year 1995. In

fiscal year 1996 there were 1620 new case filings, an increase of 27 percent over fiscal year 1995, and in fiscal year 1997 case filings jumped to 2,229, an increase of almost 38 percent over fiscal year 1996. The upward trend continued in fiscal year 1998, with 2,371 case filings, a 6 percent increase over fiscal year 1997. Our current rate of case filings is approximately 200 cases per month. In recent months, there has been a dramatic increase (approximately 11 fold during the first quarter of fiscal year 1999) in petitions for extraordinary relief—cases that demand prompt action. In addition, since the 1992 enactment of legislation extending the Equal Access to Justice Act (EAJA) to the Court, the number of EAJA applications acted upon by the Court has increased dramatically (from 290 in fiscal year 1995 to 527 in fiscal year 1998).

I anticipate that the number of cases filed in the Court will either continue at the current elevated level (about 200 per month), or increase further. I will tell you why this is likely. The number of denials by the Board of Veterans' Appeals (Board or BVA), from whose decisions the Court's appeals derive, increased from 6407 denials in fiscal year 1995, to 10,444 denials in fiscal year 1996, and to 15,865 denials in fiscal year 1997. The numbers remained at that high level in fiscal year 1998 with 15,360 denials. The Court anticipates a corresponding continued proportion of appeals to the Court. Furthermore, as noted in the Court's budget submission, the statistics kept by the Board on "denials" do not include Board decisions that deny some, but not all, of the benefits sought. The denials in such partial-denial cases are also appealable to the Court. Finally, the Board's jurisdiction, and the Court's, was broadened by legislation that became effective in November 1997 (see Pub. L. No. 105-111, 111 Stat. 2271 (1997) (codified at 38 U.S. § 7111)) to include review of claims of clear and unmistakable error (CUE) in past Board decisions that have become final. In January 1999, the Secretary promulgated final rules governing review for CUE, permitting the Board to issue decisions in all such cases, including those stayed awaiting the mid-February effective date of the rules. Thus, especially in view of the present dramatic increase in petitions for extraordinary relief and new CUE cases, the number of pending cases may exceed the rate that would be predictable as a set percentage of the number of "denials" reported by the Board.

Another factor affecting the Court's workload is the effect of unrepresented appeals. Unrepresented appeals continue to pose a challenge. The percentage of appeals filed by unrepresented appellants remained almost constant at 74 percent in fiscal year 1996 and 73 percent in fiscal year 1997, down from its highest level—80 percent—in fiscal year 1995. In fiscal year 1998 the trend was upward, with 77 percent of appeals filed by unrepresented appellants. This rate remains much higher than the unrepresented civil appeal rate in U.S. courts of appeals. The rate is not surprising because nearly half of the claimants who were denied all benefits by the BVA were unrepresented there, or were represented by organizations that do not provide representation before the Court. In addition, by law, attorney fees may not be charged for representation until the BVA has rendered a final decision on a case. Although by the time of merits disposition the rate of unrepresented appeals is reduced to about 47 percent, all unrepresented cases require extra processing attention as they progress through the various appeal stages.

Late in fiscal year 1998, as a result of the growing backlog of cases in the Court's CLS and in chambers, the Court comprehensively reevaluated its personnel requirements and determined that the increasing caseload necessitated hiring additional staff for each judge and the CLS. At that time, the Court reported to this Subcommittee that it planned to reprogram fiscal year 1999 funds from operations to pay and benefit accounts to cover the additional salary expenses for these new personnel in the fourth quarter of fiscal year 1999. However, because of the possibility of a period of operation under a Continuing Resolution, the Court has concluded that it should not employ additional staff until the fiscal year 2000 appropriation is in place. Should the Court's appropriation be for the amount requested, the new staff members would be hired at that time.

As I summarize the reasons for this request for increased staffing, I am reminded of the Chinese proverb: be careful what you wish for, because you may get your wish. In past years, I have joined those who supported the BVA's being given sufficient resources to reduce a burgeoning backlog and cut down the amount of time that benefits claimants had to wait for a BVA decision. In addition, when I testified concerning the Court's fiscal year 1999 appropriations request, I urged that sufficient funding be provided to VA General Counsel Group VII (the appellate attorneys who represent the Secretary before the Court) for adequate staffing and equipment to cut down on the very large number of requests by Secretary's counsel for extensions of time. Overburdened attorneys were slowing proceedings before the Court by repeated requests for extensions of time for the actions, required of the Secretary's General Counsel by statute and Court rules, to develop a case for disposition by the

Court. Both the BVA and VA General Counsel Group VII have been given needed funding. Their increased capability has moved the “bubble” to the Court and has dramatically raised the number of cases ready for action by the Court. To move cases expeditiously and with integrity is, and must be, the Court’s goal. Our request for increased staffing will permit us to avoid an unacceptably high, further backlog in the face of the enhanced production by the Board and VA General Counsel’s Group VII. The injustice done by delays at the Board level and in the General Counsel’s Group VII must not be allowed to occur at the Court’s level of adjudication when the cost is relatively small, compared to that experienced by the other two entities. The requested 88 FTE positions are required to maintain timely and careful case processing and dispositions for benefits claimants seeking judicial review, particularly those who come to the Court unrepresented.

In addition to personnel requirements, the Court’s fiscal year 2000 budget request reflects funding to continue revision and upgrade of the court’s automated case management system to accommodate changes in the Court’s processes and to complete updating a now-obsolete system for Windows.

Finally, in the last two years I have urged that the Representation Program be authorized and funded outside the Court’s appropriation. I continue to be concerned that linking the Court to any party before the Court can serve to undermine the public’s trust and confidence in judicial review of veterans’ claims. However, the Appropriations Committee’s consideration of the Program’s request as separate from the Court’s budget request and the removal of discretion from the Court over the Program’s funding level has separated the Court, to the greatest extent possible under current legislation, from direct involvement in the Program. Accordingly, consistent with Congress’ direction, the Court has forwarded to the Congress the Pro Bono Representation Program’s own supporting statement for its fiscal year 2000 request for \$910,000 as an appendix to the Court’s budget submission and, also consistent with that direction, has included that amount in the Court’s total fiscal year 2000 budget request. The Court has also communicated to the Representation Program’s Executive Board the Subcommittee’s request for a statement in support of the fiscal year 2000 budget request.

In conclusion, I appreciate the opportunity to present this statement in support of the Court’s budget request for fiscal year 2000. On behalf of the judges and staff, I thank you for your past support and request your continued assistance.

PREPARED STATEMENT OF DAVID B. ISBELL, CHAIR, EXECUTIVE BOARD, VETERANS
CONSORTIUM

Mr. Chairman and distinguished members of the Committee: On behalf of the Executive Board (formerly called the Advisory Committee) of the Veterans Consortium, I submit this statement in support of the request for a fiscal year 2000 appropriation of \$910,000 for the Pro Bono Program of the United States Court of Appeals for Veterans Claims—a program for which the Consortium has, from inception, had operational responsibility. The appropriation requested would represent an increase of \$45,000, or 5.2 percent, from the fiscal year 1999 appropriation of \$865,000.

I understand that the Subcommittee has previously received the Program’s proposed fiscal year 2000 budget (bearing the title The Veterans Consortium Pro Bono Program, fiscal year 2000 Budget and Narrative), as an attachment to the fiscal year 2000 budget submission by Chief Judge Nebeker on behalf of the Court. For ease of reference, however, I have also attached a copy hereto as Exhibit A. That document, I believe, provides a full explanation of the reasons for the increase in the level of anticipated expenditures, and I will not repeat its substance here. Two points do, however, deserve brief mention.

First, it will be noted that the proposed budget calls for expenditures totalling \$909,014, or slightly less than the rounded amount of the requested appropriation.

Second, and of more substance, let me offer a comment on a question that arose in connection with the hearing on the Court’s fiscal year 2000 budget by the House Appropriations Subcommittee (on March 3 of this year). The Court has requested a proportionately larger increase in its budget for fiscal year 2000 than has the Program. Given that the Court’s request rests largely on an anticipated increase in the Court’s caseload, the question was raised in that hearing, as to whether the Program has asked for a sufficiently substantial increase to deal with a similarly enlarged caseload. The answer is, we believe that what we have requested will in fact suffice. The principal reason for this is that, as noted in Exhibit A (p. 1), the Program in 1998 processed roughly 150 more requests than it received in that year—i.e., approximately 750 compared to 600—thereby substantially eliminating an accumulated backlog of requests. Although this required an extraordinary effort on the

part of the staff involved, it demonstrated that we have the capability, if need arises, of dealing with a larger caseload than we anticipate. In addition, we do not anticipate as large an increase in our caseload as is the case with the Court. The reason for this is that Program seems to be experiencing a somewhat lower rate of requests for assistance from appellants before the Court than has been the case in the past, presumably because a larger proportion of those who would otherwise be unrepresented are being offered and accepting representation on a fee-paying basis before they have been advised that pro bono representation might be available. Thus, the overall pro se rate among those filing notices of appeal with the Court has been declining; and it appears that the proportion of those who are at that point pro se and who subsequently seek assistance from the Program is also declining. In consequence, we believe that the Program has the capability of dealing with its share of the expanded caseload that the Court is planning for.

Finally, I would mention two significant statistics about the Program. By the end of 1998, the Program had recruited and offered training to 536 volunteer pro bono lawyers, and had provided pro bono counsel in a total of 1351 cases.

The Veterans Consortium Executive Board is grateful for this Committee's consideration of our budget submission.

DEPARTMENT OF DEFENSE—CIVIL

DEPARTMENT OF THE ARMY

CEMETERIAL EXPENSES

PREPARED STATEMENT DR. JOSEPH W. WESTPHAL, ASSISTANT SECRETARY OF THE ARMY FOR CIVIL WORKS

INTRODUCTION

Mr. Chairman and distinguished members of the subcommittee: I appreciate the opportunity to provide testimony to the subcommittee in support of the fiscal year 2000 appropriation request for Cemeterial Expenses, Department of the Army. I am providing this testimony on behalf of the Secretary of the Army, who is responsible for the operation and maintenance of Arlington and Soldiers' and Airmen's Home National Cemeteries.

Arlington National Cemetery is the Nation's premier military cemetery and it is an honor to represent the cemetery. This committee has historically been very supportive of the cemetery, and we appreciate your support.

FISCAL YEAR 2000 BUDGET OVERVIEW

The request for fiscal year 2000 is \$12,473,000, an increase of \$807,000 over the fiscal year 1999 appropriation. This increase will permit Arlington National Cemetery to improve its infrastructure and work toward implementation of the cemetery's Master Plan. The funds requested are sufficient to support the work force, to assure adequate maintenance of the buildings, to acquire necessary supplies and equipment, and to provide maintenance standards expected at Arlington and Soldier's and Airmen's Home National Cemeteries.

Priority investments

I would like to summarize some of the Administration's priority investments we are proposing this year.

The Army has recently completed a Master Plan for Arlington National Cemetery, which is designed to ensure that Arlington will remain active as the Nation's premier military cemetery. This plan identifies fourteen parcels of land that are located in close proximity to the cemetery and that could be used for future burials. We intend to examine those parcels that could be made available so that the future needs of the cemetery are met. These parcels include contiguous land sites that would be vacated by the Army, Navy, and Marine Corps, including the Navy Annex and a portion of Fort Myer. We solicit your support for this initiative. Funds are included in the President's Budget for fiscal years 1999–2003 to prepare concept plans to develop those parcels of land owned by the Federal government when they become excess to other government needs. Acquisition of this property would allow for continued operation of the cemetery through the 21st century. The President's Budget for fiscal year 2000 includes \$60,000 for this activity.

Second, \$200,000 is included to develop a comprehensive automation plan for the cemetery. Improved automation will not only help improve internal communications

and operations, but we also envision improved services to visitors such as automated gravesite locators.

Third, \$150,000 is budgeted to develop a ten-year capital investment plan for financing construction projects and full funding of capital investments in the most technically and financially efficient manner.

Fourth, \$300,000 continues an initiative started in fiscal year 1996 to expand contracts for enhancing the appearance of the cemetery, while reducing the overall cost and number of government employees as part of government-wide streamlining.

BUDGET DETAILS

The funds requested are divided into three programs, Operation and Maintenance, Administration, and Construction. The principal items in each program are as follows:

Operation and maintenance

The Operation and Maintenance Program, \$10,133,000, will provide for the cost of daily operations necessary to support an average of 20 interments and inurnments daily and for maintenance of approximately 630 acres. This program supports 96 of the cemeteries' total 102 FTE's.

Contractual services as part of Operation and Maintenance total \$4,267,000, including:

- \$1.755 million for grounds maintenance,
- \$840,000 for information guide services,
- \$698,000 for tree and shrub maintenance,
- \$110,000 for custodial services (Custodial services used to cost about \$210,000, however, competition resulted in a much lower bidder receiving this contract, leading to significant savings in fiscal year 1998 and 1999. This contractor has now worked during the busiest season at Arlington, and performed adequately.)
- and,
- \$864,000 for regular recurring maintenance items, such as headstone cleaning and realignment, maintenance of the eternal flame and many other minor contracts.

Administrative program

The Administration Program, \$928,000, provides for essential management and administrative functions, including staff supervision of Arlington and Soldiers' and Airmen's Home National Cemeteries. Budgeted funds will provide for personnel compensation, benefits, and the reimbursable administrative support costs of the cemeteries.

Construction program

The Construction Program includes \$1,412,000, of which \$792,000 is for new construction projects and \$620,000 is for ongoing construction projects. The new construction projects include:

Service Complex.—There is \$420,000 included in the fiscal year 2000 budget submission to correct building code problems at the Service Complex, bringing operations there into environmental compliance and improving the ability to service equipment at the complex.

Vehicle Storage Building.—There is \$222,000 included in the fiscal year 2000 budget submission to provide for design of a vehicle storage building at the Facility Maintenance Complex to protect the equipment used in cemetery operations and extend the life of the equipment by keeping it out of inclement weather.

Capital investment plan.—The 1997 proposed Master Plan for Arlington National Cemetery has identified projects to repair and replace aging facilities and utilities, preserve and protect historic resources, enhance visitor access and circulation, and provide sufficient capacity to ensure interment and inurnment of eligible veterans to the extent possible within the cemetery's boundaries. There is \$150,000 included in the fiscal year 2000 budget submission to develop a multi-year plan for financing such projects, consistent with full funding of capital investments in the most technically and financially efficient manner.

Ongoing construction projects include:

- \$60,000 to continue preparation of concept utilization plans for developing contiguous lands,
- \$165,000 to perform minor road repairs throughout the cemetery,
- \$60,000 to install a heating and air-conditioning system in a bay at the new facility maintenance complex, and
- \$335,000 to continue the graveliner program.

FUNERALS

In fiscal year 1998, there were 3,604 interments and 2,034 inurnments. In fiscal year 1999, we estimate there will be 3,600 interments and 2,100 inurnments, and in fiscal year 2000, we estimate there will be 3,700 interments and 2,150 inurnments.

CEREMONIES

Thousands of visitors, both foreign and American, visit Arlington to participate in events. During fiscal year 1998, about 2,700 ceremonies were conducted and the President of the United States attended the ceremonies on Veterans Day and Memorial Day.

During fiscal year 1998, Arlington National Cemetery accommodated approximately 4 million visitors, making Arlington one of the most visited historic sites in the National Capital Region. This budget includes \$25,000 to continue a study, begun in fiscal year 1998, to develop more reliable estimating procedures and meaningful estimates of the kinds of visitors that Arlington National Cemetery serves. This increased orientation to our "customers" is consistent with the Government Performance and Results Act and the National Partnership for Reinventing Government.

DONATIONS

A donation of \$250,000 was recently accepted by the Secretary of the Army for replacing trees on Arlington National Cemetery grounds, above that of normal maintenance.

CONCLUSION

The funds included in the fiscal year 2000 budget are necessary to permit the Department of the Army to continue the high standards of maintenance Arlington National Cemetery deserves. I urge the Subcommittee to accept this budget.

Mr. Chairman, this concludes my remarks. We will be pleased to respond to questions from the Subcommittee.

FEDERAL DEPOSIT INSURANCE CORPORATION

OFFICE OF INSPECTOR GENERAL

PREPARED STATEMENT OF GASTON L. GIANNI, JR., INSPECTOR GENERAL

Mr. Chairman and Members of the Subcommittee: I appreciate the opportunity to appear before this Subcommittee to discuss the fiscal year 2000 budget request for the Office of Inspector General (OIG) of the Federal Deposit Insurance Corporation (FDIC). This is our third year as an appropriated office, and it is my second appearance before the Subcommittee to request an appropriation.

FDIC OIG FUNDING HISTORY

The FDIC OIG has had an appropriated budget since fiscal year 1998 in accordance with Section 1105(a) of Title 31, United States Code, and is the only appropriated entity in the Corporation.¹ Our proposed fiscal year 2000 budget for \$33,666,000 represents a decrease of \$1 million, or approximately 2.9 percent under the fiscal year 1999 budget and a decrease of 10 full-time equivalent positions. This reduction is consistent with the OIG's downsizing plans developed in 1996 and the overall downsizing plan of the Corporation. The appropriation to fund OIG expenses is derived from the Bank Insurance Fund (BIF), the Saving Association Insurance Fund (SAIF), and the Federal Savings and Loan Insurance Corporation (FSLIC) Resolution Fund.

The proposed appropriation will fund 231 full-time equivalent staff, less than half the 370 employees and approximately 150 independent public accountant contractor equivalent staff that the OIG employed in January 1996. The proposed fiscal year 2000 budget is 44 percent less than the FDIC OIG's 1996 corporate budget of approximately \$60 million, adjusted for inflation. The budget and staffing reductions have been possible due to the shrinking size of FDIC, completion of much of the

¹ Prior to fiscal year 1998, the OIG budget was part of the FDIC annual operating budget approved by the Board of Directors from deposit insurance funds and other funds under the Board's stewardship.

carryover work that came from the Resolution Trust Corporation OIG in 1996, and prospects for continuing strength of the banking industry.

THE FDIC—A LONG HISTORY OF SUCCESS

The FDIC was created by Congress through the Banking Act of 1933 to provide protection for bank depositors and to foster sound banking practices. During the period from 1980 through 1994, the FDIC managed the failures of 1,617 depository institutions. From 1988 through 1992, the Bank Insurance Fund reported net income losses totaling \$25.3 billion, the first losses since the Great Depression. However, in every year since that period, the insurance fund income has been positive. The FDIC successfully liquidated billions of dollars in assets from failed banks in the 1990s and assets of failed thrifts transferred from the former Resolution Trust Corporation in 1996. Banks and thrifts in recent years have had strong earnings, and FDIC experienced no significant bank failures for 2 years until July 1998. Consequently, the BIF and SAIF accumulated the largest reserves in FDIC history, totaling \$38.8 billion in November 1998.

Given the overall stability of the banking system in more recent years, the FDIC has been able to shift its focus quite significantly. Rather than managing and resolving failed institutions as it did during the 1980s and into the 90s, the FDIC's focus now is on monitoring and assessing various existing and emerging risks to insured depository institutions. As of September 30, 1998, the FDIC insured deposits totaling \$2.8 trillion at 10,649 banks and savings associations and is the primary regulator for almost 6,000 state-chartered nonmember banks whose deposits are covered by FDIC insurance funds.

Ms. Donna Tanoue, Chairman of the FDIC, has identified the potential computer glitches in Year 2000 as "the number one safety and soundness priority" facing the FDIC and the banking industry. The Chairman has pointed out in recent speeches that there are also other risks to the insurance funds, such as stressed economies in Asia, Latin America, and Eastern Europe; rapidly growing banks with high concentrations of commercial real estate lending; sub-prime rate lending practices; insuring and supervising large, complex institutions formed through merger activities; and banking activities related to cyberbanking, electronic cash, and other highly technical financial delivery systems.

OIG FOCUS ON EXISTING AND EMERGING RISKS TO THE CORPORATION

During fiscal year 1998, the OIG's work resulted in approximately \$50.7 million in total actual and potential monetary recoveries and benefits. Additionally, our 103 audit and evaluation reports contained 165 non-monetary recommendations to FDIC management to improve internal controls and operational effectiveness in diverse aspects of the Corporation's operations, including automated systems, contracting, bank supervision, financial management, and asset disposition.

Our investigations during the year resulted in 26 indictments, 21 convictions, 53 referrals to the Department of Justice, 9 employee disciplinary actions, and 3 contractor actions. Our office also completed a 2-year joint effort with FDIC management to close out 414 contracts and resolve over 1,000 open recommendations issued by an RTC contracting oversight group. This effort resulted in \$94.6 million in disallowed costs and agreement to seek recovery of an additional \$28.8 million.

OIG WORKS IN PARTNERSHIP WITH FDIC

Notwithstanding our hallmark of independence, the OIG must work with many others as we pursue our mission of promoting economy, efficiency, and effectiveness in FDIC programs and operations and protecting the Corporation from fraud, waste, and abuse. As I discuss the major issues that face the Corporation and the nature of the OIG's work to address those issues, it will be evident that we have many successful cooperative efforts in place and at work. I will briefly elaborate on each area.

FDIC year 2000 readiness

The most immediate risks to the banking industry and the FDIC are those brought about by the coming of Year 2000. The FDIC Chairman, in testimony before the House Committee on Banking and Financial Services, outlined the Corporation's three roles in addressing the Year 2000 date change. First, in its capacity as regulatory supervisor, the FDIC must oversee institutions' management of their Y2K projects, identify potential shortcomings in advance, and, if necessary, take aggressive actions to induce institutions to take timely steps to prevent disruptions caused by the date change. Second, given its deposit insurance role, the FDIC must maintain public confidence in the financial system. Finally, if institutions do experience

disruptions or failure, the FDIC must be ready to resolve failing and failed institutions.

The FDIC established a five-phased approach to ready its internal systems and monitor the institutions it oversees: awareness, assessment, renovation, validation, and implementation. In monitoring each of the five phases, the OIG has adopted a proactive approach—briefing responsible officials and then issuing advisory memorandums when issues of concern arise. Our approach has been successful, and prompt action has been taken to improve internal and external Y2K efforts. The proactive approach has allowed us to assist the Corporation in avoiding unnecessary costs that result from incomplete requirements, not considering alternatives, inaccurate or overly optimistic feasibility and cost-benefit studies, and inadequate testing. In addition, my office is quickly raising issues for management consideration and closely coordinating with the Offices of Inspector General of the member agencies of the Federal Financial Institutions Examination Council to address Y2K issues. Thus far, the FDIC has made positive Y2K progress in both readying its internal systems and operations and in monitoring the efforts of the institutions it oversees. According to the FDIC Chairman, as of February 1999, 97 percent of the industry is on schedule in making sure their computer systems are ready for the Year 2000 date change and there is no safer place to keep your money than in a federally insured account at a bank or savings institution.

Supervising insured institutions

Another challenge to the Corporation is to ensure that its system of supervisory controls will identify and effectively address financial institution activities that are unsafe. To help the FDIC more effectively fulfill its bank supervision responsibilities, the OIG has targeted a number of key areas, including: safety and soundness examinations; coordination with other federal and state banking regulators; problem bank identification, supervision, and monitoring; specialty areas in supervision, including capital markets instruments, international banking, and on-line banking activities; the compliance examination program, including the frequency, priority, and scope of these examinations, and the Community Reinvestment Act examinations and related programs.

Here are some recent results of audits:

- We completed a material loss review on the failure of BestBank, Boulder, Colorado. This review is mandated by section 38(k) of the Federal Deposit Insurance Act, and in accordance with that statute addressed the FDIC's supervision of the institution and causes of the bank's failure. BestBank was closed in July 1998 and is the most significant bank failure in the last 2 years, with losses to the insurance fund estimated by the FDIC to be at least \$171.6 million. We reported that FDIC's regulatory oversight of BestBank could have been more effective in controlling the bank's rapid asset growth and curbing the subsequent insurance fund losses.

Obstacles created by BestBank management impeded the regulators' access to the bank and questions regarding existing regulatory authority restricted access to a third-party entity that directly controlled a majority of the bank's assets. The examiners continued to rate BestBank although they did not have sufficient or reliable information to support the ratings, particularly asset quality. Moreover, the supervisory tools that were available to the regulators were not aggressively pursued in a timely or effective manner. The audit recommends that examiners have full access to all pertinent bank records when conducting safety and soundness examinations.

- The OIG completed an audit of the Corporation's policy for determining the frequency, scope, and priority of compliance and the effectiveness of CRA exams. The FDIC revised its policy on examination frequency, scope, and priority to allow for a period of up to 5 years between full-scope examinations for an estimated 90 percent of FDIC-supervised banks. Our audit report focussed on the risks associated with the new policy as it related to extended examination frequencies and methods used to identify compliance risk in FDIC-insured institutions. As a result of our audit, FDIC management has agreed to rescind its policy and to conduct all compliance reviews on a maximum 3-year cycle.

Additionally we have initiated the following audit:

- We initiated an audit of FDIC's Community Reinvestment Act examination process in Washington headquarters and selected regional offices. The objectives will be (1) to determine whether CRA criteria and benchmarks are well defined, (2) determine whether CRA examination guidelines are consistently applied within and among regional offices, (3) determine whether CRA examination procedures are applied in a manner that ensures that the resulting ratings provide an accurate measure of the banks' performance, and (4) evaluate the consist-

ency of the application of procedures on an interagency basis based on the results of the 1998 FFIEC CRA Examination Consistency Project.

Maximizing returns from failed institutions

The FDIC's challenge in its receivership management program is to reduce the negative financial effects of failing and failed insured depository institutions. The Corporation focuses its efforts on four areas: resolving institutions in the least costly manner, managing and marketing failed-institution assets to maximize return, pursuing monies due to the failed institution, and resolving debts to the institution fairly. As of March 31, 1999, the FDIC managed receivership assets totaling \$2.134 billion in book value. The FDIC held \$3.3 billion in its reserve fund balance for securitizations and as of February 28, 1999, held \$786 million in book value of assets for equity partnerships. In addition, of the \$1.2 billion in court-ordered restitution owed to the FDIC from several hundred individuals and entities, about \$139 million has been collected as of March 31, 1999.

As the amount of retained assets decreases, the FDIC's asset management and disposition responsibilities will be reduced, and the overall risk associated with this area will decline. Similarly, receivership and resolution activities will lessen. However, two of the most current significant risk areas for FDIC assets are securitizations and equity partnerships. These areas are critical because of the large dollar amounts involved and the structure of the transactions. During the last 3 years, the OIG has issued 19 audit reports and 1 survey memorandum related to securitizations and equity partnerships. Our work in this area has resulted in almost \$8 million in questioned costs and recommendations to improve FDIC's oversight. We currently have 6 audits ongoing in the securitization and equity partnership areas and will focus on calculations of realized losses, unallowable expenses, the adequacy of oversight, and affiliate transactions.

Our Office of Investigations has been active in investigating cases in the area of contractor fraud and concealment of assets by FDIC debtors. Some recent results of OIG investigations include:

- The Ryland Mortgage Corporation pled guilty to two counts of impeding the functions of the Resolution Trust Corporation (RTC). Ryland Mortgage was ordered to pay \$8.7 million in restitution and fines, the largest monetary recovery ever to result from an FDIC OIG investigation. Our 3-year investigation uncovered a complex scheme in which the contractor defrauded the RTC of \$3.5 million by misrepresenting the amount of funds it collected in connection with the servicing of loans on RTC's behalf. Two former officials of the corporation who pled guilty to similar charges received sentences comprised of monetary fines, home detention and probation.
- In partnership with the Corporation's Division of Resolutions and Receiverships, the U.S. Attorney's Offices, and other federal agencies, we have begun to see significant results from a series of investigative initiatives involving FDIC debtors who have concealed assets or committed other fraud in attempting to avoid repayment of their obligations to FDIC. One of our initial efforts in this area resulted in a \$1.1 million recovery from two felons who concealed assets and lied to the court to avoid paying their court-ordered restitution. In another joint investigation with the FBI and IRS, an FDIC debtor was criminally convicted, sentenced to serve 37 months in prison, and was ordered to pay \$2.9 million in restitution. Our investigation found that the debtor, who defaulted on a \$4.9 million loan from a failed financial institution, concealed his financial interests during a bankruptcy proceeding.

Our investigators will continue to seek to uncover similar situations in order to help the Corporation receive the restitution it is due.

Oversight of contracting activities

The FDIC and the former RTC relied heavily on the private sector to accomplish the mission of managing and selling assets of failed banks and saving institutions. Over the past 9 years, the FDIC and RTC spent billions of dollars in contractor fees to assist the Corporation in fulfilling the many urgent assignments mandated by legislation and the banking and thrift industry crises. Although 3 years have passed since the RTC's sunset and RTC-related contracting has lessened, the FDIC continues to rely on private-sector contractors in conducting its work. Contractors assist the FDIC in many areas, including legal matters, property management, information technology, and financial services.

The OIG has continued to focus its resources on auditing contracts and agreements and during fiscal year 1998 we identified a total of \$19.3 million in questioned costs for the strategic area of contract award and oversight. Overall, during

the period April 1996 to September 1998, our work in the contracting award and agreement area has resulted in about \$75 million in questioned costs.

One of the most significant areas of contract audits has been our joint effort with the Corporation's Legal Division to review legal fee bills submitted by firms doing business for both the former RTC and FDIC. In fiscal year 1998, we issued 62 legal fee bill audits in which we questioned over \$13 million. Management agreed to disallow slightly more than \$4 million of that amount. In total, the former RTC and FDIC OIGs have issued nearly 300 legal fee bill audit reports with questioned costs of more than \$37 million.

Our partnership with FDIC management to close out over 414 RTC contracts since 1996, previously discussed, is another example of the OIG's efforts to contain the costs of FDIC and the former RTC's use of contractors.

Other OIG reviews

My office continues to work with the U.S. General Accounting Office (GAO) toward the goal of the OIG assuming full responsibility for the annual audits of the FDIC's financial statements that the Chief Financial Officers Act requires of all government corporations. The OIG's increased involvement with the annual audit began in 1995, and the OIG continually assumes additional duties. For the 1998 financial statement audit, the OIG has assigned 65 percent of the staff, as the OIG has assumed full responsibility for several key areas of the audit including cash management, investments, and asset valuation. My office is committed to this project and OIG and GAO management have agreed that there are mutual benefits of the OIG assuming responsibility for the annual financial statement audit. We expect to streamline the audit process and provide cost savings to the Corporation through our work on this audit.

During this fiscal year we have provided advisory assistance to FDIC management on its revised Strategic Plan for 1998–2003 and its Annual Plan for 1999 to assure that these plans comply with the Results Act. The OIG will continue to monitor and review proposed legislation in the Congress to amend the Results Act and will actively participate through the President's Council on Integrity and Efficiency and interagency groups it sponsors to define an appropriate OIG role in the Results Act arena. In the interim, we have initiated evaluations to verify and validate the data and systems supporting information reported by the Corporation in its GPRA reports. We also plan to address GPRA objectives and goals, when appropriate, in the course of doing audits and evaluations.

We issued 5 evaluation reports to FDIC management that covered a wide range of issues, including the Corporation's Office of Diversity and Economic Opportunity's discrimination complaint program. As a result of our recommendations on the discrimination complaint program, the Corporation has completed and issued agency decisions on a number of older cases; agreed to develop office-wide performance goals and performance expectations for individual staff, and to carry out EEO-required tasks more timely; implemented a new case tracking system, and taken positive steps toward developing an alternative dispute resolution program. Another evaluation report on the corporate lease acquisition process resulted in the following actions: (1) better and more timely information being provided to FDIC's Board of Directors on proposed leases for its use in making decisions; (2) justification for lease terms in excess of the Corporation's staffing projections; and (3) improved tracking and reporting of renovation costs.

We referred 65 substantive Hotline allegations for review or investigation during fiscal year 1998. During its most recent 3-year period, the Hotline has referred almost 200 allegations for further review or investigation, targeting a wide variety of alleged wrongdoing, including employee misconduct, contract abuse, and asset management issues. Almost 40 percent of these cases were referred to the OIG Offices of Investigations, Audits, or Evaluations, and the other 60 percent were referred to FDIC management for review and action.

We reviewed 61 proposed corporate policies and reviewed 25 draft regulations and proposed legislation, and provided comments when warranted. In addition, we responded to 51 Freedom of Information Act and Privacy Act requests and appeals during fiscal year 1998. We have also provided oversight of FDIC's internal control activities under the Chief Financial Officers' Act and the Federal Managers' Financial Integrity Act.

We participated with 3 other OIGs—Department of the Treasury, Federal Reserve and the National Credit Union Administration—on an interagency task force, which reviewed the Federal Financial Institutions Examination Council (FFIEC) training program. The FFIEC was created in 1979 as an interagency body to prescribe uniform principles, standards, and report forms for the federal examination of financial institutions and promote uniformity in the supervision of these institutions. The

task force reported to the FFIEC Chairman that the Council is reasonably successful in fostering coordination of training activities among the 5 federal financial institution regulatory agencies. The report detailed two recommendations for the Council to consider immediately, one related to the FFIEC's appropriation and another dealing with a supervisory issue. The report also outlined plans for future joint audits of the FFIEC.

OIG MANAGEMENT INITIATIVES

Since I became Inspector General in April 1996, we have continually sought to enhance the OIG's effectiveness. During fiscal year 1998, we began an effort at self-evaluation of our work processes, including having a peer review of our audit operations by another OIG. The peer review concluded that the system of quality control used by the FDIC OIG was designed in accordance with standards established by the President's Council on Integrity and Efficiency and provided reasonable assurance that our office was in conformance with professional standards in the conduct of its audits. We also updated our own strategic plan and annual performance plan to be consistent with the Corporation's plans and to comply fully with Results Act requirements. Our 1999 annual performance plan is included in the fiscal year 2000 budget we previously sent to the Subcommittee. Our strategic goals, objectives, and operating principle are intended to provide a value-added focus to the Corporation and are directly related to the FDIC's mission, strategic goals and objectives, and corporate operating principle. Also, consistent with our strategic and annual plans, we recently initiated client and employee surveys to identify opportunities to improve our effectiveness as an organization.

In addition, we are moving forward in assuming the personnel and contracting authority afforded the OIG under the Inspector General Act. The FDIC Chairman agreed in July 1998, that, in line with the independence of the OIG, my office should have the authority to make its own personnel and contracting decisions—authority that had previously resided with other corporate officials. We are in the process of hiring staff and anticipate that we will fully take over this responsibility in fiscal year 1999. I view the Chairman's decision as a major step in enhancing the OIG's independence.

Another significant initiative is our effort to review workplace diversity issues. The Corporation and the OIG strive to ensure that our workforce draws more broadly from the diverse population found in various American professions. By including individuals with diverse backgrounds in every aspect of our operations, we strengthen our ability to serve OIG employees as well as our clientele. The Corporation is developing a plan with several diversity initiatives designed to maintain and enhance the quality and diversity of its workforce. Likewise, my office is conducting its own study, in accordance with the House Subcommittee on VA, HUD, and Independent Agencies; Committee on Appropriations' report on the fiscal year 1998 appropriation, that will address the diversity of our staff and issues that staff believe are important to successfully have a diverse workplace.

FISCAL YEAR 2000 BUDGET

Our reduced budget will result in a slightly lower level of audit and investigation activity for fiscal year 2000 than planned for fiscal year 1999, but this reduction is consistent with planned corporate downsizing. The fiscal year 2000 budget reflects decreases in salaries and benefits consistent with the reduced staffing funded by the budget. The budget also includes money to (1) fund higher travel expenses, (2) pay outside printing expenses required by the OIG, and (3) replace computer equipment in accordance with the Corporation guidance on equipment replacement cycles.

In fiscal year 2000, the OIG will continue to focus on areas of highest risk to the Corporation and deposit insurance funds. A key goal is to assess the manner and extent to which FDIC programs and activities achieve their intended objectives, as outlined in the Corporation's Strategic Plan. Among specific audit work planned, we will continue to review FDIC's efforts to ensure that banking institutions and the Corporation itself have automated systems capable of recognizing dates properly in Year 2000. Also, we plan to closely oversee the Corporation's large investment in information technology initiatives, including automated systems development and security over access to information. We will continue to review the strategic area of contract award administration and oversight; the supervision of insured institutions; and play a greater role in our cooperative effort with the General Accounting Office to audit FDIC's financial statements. Investigative work will focus on fraudulent bankruptcies where FDIC is a creditor, hiding assets to avoid paying court-ordered restitution to FDIC, and making false statements to FDIC to secure favorable loan compromises and settlements. Also, we anticipate continuing our active role in

providing advisory assistance to management in its strategic and annual performance plan initiatives.

Mr. Chairman, throughout my testimony I have addressed existing and emerging risks to the Corporation and its insurance funds. Also, I have discussed how my office is working with the Corporation in a partnership to address these risks and to help make FDIC programs work better. FDIC Chairman Tanoue has been supportive of the OIG since she took office last spring. She has recognized the need for an independent OIG and has been receptive to my advice—making this a true partnership.

In closing, I believe very strongly that the OIG continues to be a valued asset to FDIC. As the FDIC OIG marked its 10th anniversary and we celebrated over 20 years since passage of the Inspector General Act, I want to thank the Subcommittee for its commitment and urge your continued support for our work.

Additional details supporting our budget request are in documents that have been provided to the Subcommittee staff.

GENERAL SERVICES ADMINISTRATION

CONSUMER INFORMATION CENTER

JUSTIFICATION

Mr. Chairman and Members of the Subcommittee, thank you for the opportunity to present the fiscal year 2000 budget request of the Consumer Information Center (CIC).

The Consumer Information Center was established by an Executive Order in 1970, and for 30 years CIC has served consumers through partnerships with more than 40 Federal departments and agencies. CIC provides an effective vehicle to inform the public about vital topics such as health and safety issues, developments in Federal programs, and the impact and effects of Federal research and regulatory actions. CIC fulfills its mission mandate by ensuring public awareness of and access to this information and by making it available to the public through a variety of new and time-proven programs.

In recent years, we have been experiencing a revolution in the ways that Americans obtain and use information. During much of CIC's history, the public got Federal consumer information primarily by writing for printed publications from CIC's distribution facility in Pueblo, Colorado. But with the dominance of computers and their emphasis on instant access to information, Americans are now relying less on printed materials for information, especially those ordered by mail.

To meet this challenge, CIC has reinvented the way it serves the public. Moving from a concentration on the printed word to a larger vision of a central reservoir of information that can be accessed in a variety of ways, CIC continues to make it easy for citizens to use and benefit from Federal information. Specifically, last year CIC significantly improved its toll-free telephone ordering service and, at the same time, added a publication ordering system to an expanded and improved web site.

Consumers can now place publication orders by calling the toll-free number, 1 (888) 8 PUEBLO, while customers with Internet access can visit the CIC web site (www.pueblo.gsa.gov). They can then view the information online, copy it to their home computers, or use CIC's secure online ordering system to place credit card orders for printed copies of the information. CIC has the full text of approximately 500 consumer publications available on the Internet along with Federal agency recalls and special notices, consumer news, and links to consumer sites in the Federal and the private sector.

Reflecting the nation's new information environment, CIC saw printed publication distribution decrease from 8.3 million in fiscal year 1997 to 7.6 million in fiscal year 1998. During the same time, page accesses to CIC's web site increased from 4 million to 6.5 million and CIC's toll-free telephone system received nearly 300,000 requests. These program successes and accomplishments reinforce CIC's commitment to its mission mandate. Throughout any program transition that CIC undergoes, our goals and objectives remain focused on delivering to the public useful and reliable information that is a by-product of ongoing Government activities.

In keeping with the goal of delivering the best government consumer information, in fiscal year 1998 CIC updated and released the 1998–99 Consumer's Resource Handbook (CRH). The CRH is a prime example of Government empowering individuals to solve their own problems and answer their own questions by providing them with the best and most direct sources of assistance. Published continuously since 1979, the CRH is one of the most popular consumer documents ever issued by the

Government. The requested appropriation of \$2,622,000 includes an amount of \$300,000 for producing and distributing the CRH. During fiscal year 1998, CIC distributed 340,000 copies and will distribute a comparable amount in fiscal years 1999 and 2000.

CIC also produces the Consumer Information Catalog which lists the CRH and hundreds of other popular titles on subjects such as money management, health, and Federal programs and benefits. I'm pleased to present our newly redesigned Catalog featuring four colors, bright graphics, a photographic cover, livelier copy, and simplified ordering instructions. The new version makes it easier than ever to order Federal consumer publications, and offers the options of mailing in the order form, or faxing it, or calling in to our toll-free number, or reading the publications and ordering them online. In fiscal year 2000, CIC will distribute approximately 12 million Catalogs primarily through educators, nonprofit associations, large and small businesses, libraries, and Members of Congress.

During fiscal year 2000, CIC will also continue to build the cooperative publishing program, where private sector entities share the costs of making publications available for listing in the Catalog. In fiscal year 1998, 19 private sector partners worked with Federal agencies to develop and fund publications on topics of mutual interest, bringing the total number of cooperative publications to date to 162.

In conclusion, CIC will continue to meet the information challenges offered by the new century. Its accomplishments will be measured by its successful research and identification of valuable Federal information; its media and marketing programs; its centralized publication distribution system in Pueblo, Colorado; and its widely acclaimed web site. I am confident that the services CIC delivers to the public will continue to play an important role in maintaining a healthy consumer economy and in providing a vital communications bridge between citizens and their Government.

Mr. Chairman, again I thank you for the privilege on behalf of the Consumer Information Center to present its budget request for fiscal year 2000. We trust that the Committee will agree that CIC is a valuable Federal program and that it will look favorably upon our request.

NATIONAL CREDIT UNION ADMINISTRATION

PREPARED STATEMENT OF NORMAN E. D'AMOURS, CHAIRMAN

Thank you for allowing me to present the National Credit Union Administration's request for the NCUA Central Liquidity Facility (CLF) and report on the condition of federally-insured credit unions.

The CLF, established in 1979, serves as a liquidity source for credit unions. It is funded by its credit union members and may borrow from any source; it currently has a borrowing arrangement with the Federal Financing Bank. The CLF borrowing authority is not used to build up loan volumes because the Federal Credit Union Act prohibits using proceeds from CLF loans to expand credit union portfolios. Rather, the funds are advanced strictly to meet credit union liquidity needs, in response to circumstances dictated by market events. NCUA is not requesting an appropriation for the CLF, merely removal of the appropriations cap on the CLF's borrowing authority. Removal of this cap would have no budgetary or scoring impact.

The limit on CLF borrowing for new loans to credit unions has remained at \$600 million for the last 18 years. The budget submitted by the Office of Management and Budget requests a \$600 million limit on borrowing and a \$257,000 limit on administrative expenditures for fiscal year 2000. Although the statutory language submitted in our justification tracks the OMB's request, we are requesting the removal of this borrowing cap in anticipation of possible liquidity demands credit unions may face due to the approach of the Year 2000.

Removing the appropriations cap on CLF borrowing does not mean that there is no cap on CLF borrowing, but rather that the cap contained in Section 307 of the Federal Credit Union Act (12 U.S.C. 1795f) applies. Under the provisions of the Federal Credit Union Act which established the CLF, the CLF is permitted to borrow up to 12 times its subscribed stock and surplus, or currently about \$18.5 billion. While the \$600 million appropriations limit has, in the past, been adequate to address isolated liquidity needs in credit unions, this amount represents less than 3.25 percent of the \$18.5 billion which the CLF would be permitted to borrow under its enabling legislation. When the \$600 million limit was first inserted into the Appropriations measures, in 1980, \$600 million exceeded 12 times the subscribed stock and surplus of the CLF. Clearly, Congress did not intend to restrict the borrowing ability of the CLF to an amount less than the cap contained in the Federal Credit Union Act.

Despite general inflation, dramatic growth in credit union assets, and the increase in the CLF's subscribed stock since 1980, the appropriations limit has never been adjusted. The approach of the Year 2000 may trigger a system-wide increased demand for liquidity, and the \$600 million CLF borrowing cap could frustrate NCUA's ability to address short-term liquidity needs of credit unions at the end of this year.

Before I go any further, I want to emphasize that credit unions are quite prepared for the Year 2000 transition. As of December 31, 1998, 97 percent of all federally insured credit unions were Y2K ready or on schedule to become so. The few credit unions which have not met NCUA's deadlines are subject to intense supervision and we will ensure that they are also ready. Although NCUA sees no need for credit union members to withdraw larger than usual amounts of cash before the year 2000, it is possible that excessive media focus on the date change will cause an increased demand for cash at the end of 1999. I repeat—there is absolutely no substantive reason to withdraw large amounts of cash. But we all know that sometimes human actions are not based on logic, and NCUA has a responsibility to ensure that credit unions are able to deal with the threat of increased liquidity demands at the end of 1999. The \$600 million limit on CLF borrowing could impede our efforts in that regard.

While it is difficult to gauge the potential demand on the credit union system due to the Year 2000 date change, estimates range from \$2 billion to \$20 billion. For example, if each of the estimated 15 million households which use a credit union as their primary financial institution withdraws an extra \$500 at the end of 1999, the credit union system will be faced with an extra liquidity demand of \$7.5 billion. While the credit union system, through its network of wholesale credit unions known as corporate credit unions, has some capacity to supply liquidity and may have the capacity to meet this level of demand, it would need to rely on the CLF in order to meet liquidity needs above this level. While some have suggested that credit unions access the Federal Reserve's discount windows, 42 percent of credit unions do not offer the types of accounts which would allow them to qualify for discount window access. Further, the number of credit unions with actual access is extremely low—only 20 of more than 11,000 credit unions currently have discount window access, with an additional 300 in the application process. Moreover, eligibility to apply to the discount window does not guarantee approval.

NCUA is committed to achieving a workable solution to the potential Y2K liquidity demand. Removal of the CLF's borrowing cap is by far the best solution because it eliminates the need to create new, untested systems and structures to distribute liquidity. Nonetheless, we have been examining other alternatives with the assistance of the Federal Reserve. Such alternatives should accomplish the goal of providing the credit union system with adequate liquidity, but they have not been tested, they are not yet in place, and they lack the economy and simplicity of lifting the cap.

I am pleased to report to the Subcommittee that we continue to streamline the CLF, resulting in cost savings for credit unions. Our fiscal year 1998 operating expenses were \$154,000—significantly below our budget limitation of \$203,000. In 1998, all of CLF's net income was returned to member credit unions in the form of capital stock dividends. While next year's operating expense request of \$257,000 is slightly higher because of the addition of one staff member, this still represents a substantial decline over the past few years, as CLF expenses in fiscal year 1993 were \$767,000.

Mr. Chairman, we respectfully request that you support our authorization request in order to continue the NCUA's and CLF's ability to respond to adverse liquidity situations.

Turning to another subject, I would like to thank the Subcommittee for providing an additional \$2 million for NCUA's Community Development Revolving Loan Fund in fiscal year 1999 for loans to low-income credit unions. Since 1987, when the NCUA began administering the Fund, we have revolved our \$10 million appropriation (\$6 million initially, \$1 million in both fiscal years 1997 and 1998, and \$2 million in fiscal year 1999) into 141 loans totaling \$19.3 million. In 1998 alone, we approved 17 loans to 17 credit unions for a total of \$3 million. As of January 31, 1998, our pending applications total \$1.4 million. We appreciate the Subcommittee's support of our efforts to provide assistance to low-income credit unions.

Finally, I would like to briefly summarize the current condition of credit unions and the National Credit Union Share Insurance Fund (NCUSIF). Once again, credit unions had a banner year in 1998—assets are at a record level, while the number of problem credit unions remains low. During 1998, total assets of federally-insured credit unions increased by 7.4 percent, from \$351.2 billion to \$388.7 billion. Despite the increase in assets, credit unions' overall capital to asset ratio remained strong at 11.5 percent, on average. The number of problem credit unions (those rated code

4 or 5) is also down, to 297 from 330 at year-end 1997; these problem credit unions represent less than 1 percent of total shares. These figures demonstrate the continued overall safety and soundness of the credit union system.

The credit union insurance fund also remains strong. For the fourth consecutive year, and the fifth time in its history, the National Credit Union Share Insurance Fund returned a dividend to credit unions on their deposits in the fund. The dividend this year—\$118 million—was the largest dividend ever returned to credit unions. In October, before the dividend payout, the equity level of the Share Insurance fund reached 1.32 percent. Even after the largest dividend in its history, the Insurance Fund returned to the 1.30 level by December 31, 1998.

In summary, the credit union industry remains in excellent condition, with a strong insurance fund. While demand still outstrips supply, low-income credit unions are receiving more assistance than ever before, thanks to this Subcommittee's efforts. With the removal of the CLF's borrowing cap, we will be able to address any possible Y2K credit union liquidity needs. NCUA's justification and budget tables follow below.

NEIGHBORHOOD REINVESTMENT CORPORATION

PREPARED STATEMENT OF GEORGE KNIGHT, EXECUTIVE DIRECTOR

Thank you, Mr. Chairman and Members of the Committee, for the opportunity to submit a written statement supporting our fiscal year 2000 budget request and especially for your long-time support of the NeighborWorks® network and the Neighborhood Reinvestment Corporation. I am honored to update you on the exciting results of fiscal year 1998 and present the Corporation's fiscal year 2000 budget request for level-funding of \$90 million.

FISCAL YEAR 1998 RESULTS

FY 1998 was an amazing year! Building on the opportunities in this unprecedented era of economic growth, over the last year the 184 organizations in the NeighborWorks® network:

- Assisted 13,769 families by creating new homeowners, sustaining existing owners through major rehabilitation, and creating affordable mutual and rental housing units— a 20 percent increase;
- Repaired an additional 12,702 homes, enabling better living conditions and more attractive neighborhood blocks—an 18 percent increase
- Owned 19,296 units of affordable mutual and rental housing (at year's end)— a 28 percent increase; and
- Secured public/private investments of more than \$819 million—a 48 percent increase over fiscal year 1997.

In addition, through this NeighborWorks® system which includes the national NeighborWorks® network, Neighborhood Reinvestment and Neighborhood Housing Services of America (NHSA), we:

- Purchased (through NHSA) \$42.8 million in loans made from NeighborWorks® organizations' revolving loan funds;
- Expanded by 9 organizations the number of NeighborWorks® organizations that now serve 825 communities nationwide; and
- Provided over 7,297 community development practitioners 149,106 contact hours of nuts-and-bolts training.

FISCAL YEAR 1999 YEAR TO DATE

None of these exciting achievements would be possible without this Committee's steadfast commitment and confidence in the NeighborWorks® system. Last year's fiscal year 1999 appropriation allowed for a significant expansion of the NeighborWorks® Campaign for Home Ownership 2002 by dedicating \$25 million to a Homeownership Pilot. The pilot allowed for expansion from 25,000 to 35,000 homeowners and requires securing an additional \$700 million in lending capital. The two-year pilot requires a significant increase in productivity at the local levels, strengthened systems (including financial controls), and increased conventional capital available for first mortgage lending and property casualty insurance. I am pleased to report that the Campaign's major partners, as exemplified by our national partners: Allstate; BankAmerica/NationsBank; Fannie Mae and the Fannie Mae Foundation; Fleet Bank; Freddie Mac; State Farm; USAA; and World Savings; as well as 12 regional partners and more than 100 other local partners are stepping up to the plate with enthusiasm.

In order to meet the ambitious two-year goal of creating 10,000 additional homeowners, Neighborhood Reinvestment had to play its part in expeditiously committing the funds in the most effective and efficient manner. Our plan was to commit 92 percent (\$23 million) of the Homeownership Pilot's \$25 million in grants to NeighborWorks® organizations' revolving loan funds, systems development and financial/rehab counseling needs. By targeting these grants to removing the bottlenecks to greater productivity, our anticipation is that 10,000 additional homeowners may be secured without experiencing unacceptable delinquency and default rates. Perhaps most importantly, these activities institutionalized an increased capacity for the future.

I'm pleased to report that all but \$1 million is committed:

- We issued the Request for Proposals on October 30, within one week of the fiscal year 1999 VA, HUD and Independent Agencies enacted Appropriations bill;
- 97 Responses were received by the deadline, December 9; and
- Neighborhood Reinvestment's board committee met on January 12 and finalized 74 awards totaling \$22 million.

Most of the additional \$1 million was awarded to participating NeighborWorks® organizations based on applications received on April 15, 1999; the remainder will be disbursed by the end of the fiscal year.

Needless to say, the local NeighborWorks® partnerships are grateful for the opportunity and are hard at work. The Neighborhood Housing Services (NHS) in Ithaca, New York, for example, has been able to commit counseling and financing assistance to customers of a local credit union who have been saving for their home purchase. These lower-income potential homebuyers have saved carefully but, in many instances, will be purchasing homes in need of repair. The Ithaca NHS will be able to provide second mortgages for rehabilitation through its revolving loan fund, thus ensuring the viability and safety of the property, the first mortgage holder, the property-and-casualty insurer, the city tax base, and the health of the neighborhood. In a host of other cities such as Ithaca, these funds are providing NeighborWorks® organizations with an extraordinary opportunity to assist potential homebuyers who have consistently fallen through the cracks—families with incomes that are marginally too high to qualify for most available public assistance and decidedly too low to go it on their own. The flexible resources available through this pilot will make both existing subsidy programs and conventional resources work in our neighborhoods as never before.

Highlights of the first 12 months of the five-year (1998–2002) NeighborWorks® Campaign for Home Ownership 2002 follow. As of December 31, 1998, the participating 107 NeighborWorks® organizations: Created 6,874 new homeowners, of which: 91 percent are low- or moderate-income households; 55 percent are ethnic or minority households; 63 percent are single heads of households; 44 percent are women; 95 percent are first-time buyers; and for 31 percent of these, owning is less costly or only marginally more costly than renting.

—Secured \$585.6 million in private/public investment from outside partners.

I'm concerned that I may be leaving the impression that the only activity of NeighborWorks® organizations is to increase home ownership. Far from it! Consistent with the basic philosophy of the network that home ownership and healthy neighborhoods are inextricably bound together and mutually reinforcing, during fiscal year 1999 NeighborWorks® organizations will add 2,850 units of additional mutual and rental affordable housing, conduct hundreds of volunteer projects ranging from new home construction, clean-up/fix up, community gardens, alley sweeps, and similar efforts. NeighborWorks® organizations will also use their revolving loan funds to assist business owners to establish and/or expand businesses, work with local governments to create neighborhood parks, conduct after-school programs, and initiate numerous other community-building activities.

Part of the NeighborWorks® system's success over the years is due to Neighborhood Reinvestment's ability to monitor local financial controls and provide technical assistance, training and limited grants to support the wide variety of locally generated strategies and approaches. In preparing for fiscal year 2000's submission, I felt it was important to emphasize that our intent is to support locally designed strategies rather than to create a series of "programs" which then force local organizations to contort their efforts to "fit" the eligibility requirements for financial or technical assistance.

LOOKING AHEAD TO FISCAL YEAR 2000

Thus, you'll see that our objectives for fiscal year 2000 seek to balance our resources to meet the highly varied and diverse needs of the communities served by the 184 NeighborWorks® organizations. We hope to slightly expand the number of

communities served and the number of charter members as well as continue to provide high-quality training to the entire community development field. We also hope to provide grants to augment local revolving loan funds, which have been one of the most critical engines for community revitalization.

Housing rehabilitation for existing homeowners has long been the cornerstone of NeighborWorks® revitalization efforts, and remains key. Only when each responsible owner can borrow the necessary capital to meet his or her needs will communities return to stability and attractiveness to new homeowners.

A recent empirical study in Cleveland, by Cleveland State University, shows that every \$1 investment in home rehabilitation adds 13 cents to the value of homes located within 150 feet of the rehab project. Thus, the average investment (in the Cleveland study) of \$31,000 in substantial rehab added \$4,000 to the sale price of every home located within 150 feet. The study also shows that above-average rehab investment, or multiple rehabs in a block, have even a larger effect on the value of nearby homes.

Our technical assistance will focus on specific local needs as well as on strategic initiatives inspired by members of our network that promise to benefit the network as a whole.

THE NEIGHBORWORKS® CAMPAIGN FOR HOME OWNERSHIP 2002

The NeighborWorks® Campaign for Home Ownership 2002 focuses on expanding its impact in terms of the number of new homeowners served and strengthening the capacity of local systems to manage expanded productivity.

In order to meet this mission, over the next five years the NeighborWorks® Campaign for Home Ownership 2002 intends to:

- Create 35,000 new low- to moderate-income homeowners;
- Counsel an additional 270,000 potential owners; and
- Generate \$2.5 billion of public/private investment in underserved communities.

With the fiscal year 2000 appropriation of \$90 million, we would further expand the NeighborWorks® Campaign for Home Ownership 2002. Grants would enable NeighborWorks® organizations to provide prepurchase as well as postpurchase counseling, first and second mortgages, home-repair loans, and foreclosure-intervention assistance. Neighborhood Reinvestment estimates that this assistance will:

- Yield 7,000 additional new homeowners;
- Enable the NeighborWorks® organizations to assist thousands of families to maintain home ownership (through rehabilitation, property repairs, postpurchase counseling and foreclosure intervention);
- Leverage a total of \$390 million in additional outside investment; and
- Prevent millions in foreclosure losses.

The NeighborWorks® Campaign for Home Ownership 2002, with the proposed fiscal year 2000 appropriation, will create more than 42,000 new homeowners! This is nearly three times the number created in the first five-year campaign from 1993 to 1997.

MULTIFAMILY INITIATIVE

Affordable, quality multifamily housing is also essential to helping distressed communities. Many NeighborWorks® organizations have approached community revitalization through ownership and management of multifamily units within the mutual or rental tenure mode. Several now own more than 1,000 units and provide—in addition to affordable quality units for families—after-school programs and day care and summer activities. In an effort to better meet the requests for technical assistance a group of NeighborWorks® organizations launched in February of this year a five-year initiative to:

- Strengthen asset management practices throughout the NeighborWorks® network to ensure that properties owned and managed by NeighborWorks® members are financially, physically and socially secure and thus able to serve their communities for the very long run;
- Develop strong resident leaders and services such as after-school learning centers, tutoring, and adult learning opportunities so that families can enjoy successful long-term tenure, thus leaving energy and dollars to pursue other family goals;
- Attract \$600 million in public- and private-sector investments; and
- Add 10,000 multifamily units to the 19,000 currently owned by NeighborWorks® organizations.

MEETING THE NEEDS OF RURAL COMMUNITIES

The work of the Rural NeighborWorks® Alliance (a group of 25 NeighborWorks® organizations which banded together in 1991) is to find creative, proactive ways to address rural housing concerns and increase the focus on organizational resources for rural development. Rural NeighborWorks® Alliance operates a revolving loan fund and, with investments from Fannie Mae, the MacArthur Foundation and Neighborhood Reinvestment, the total capitalization has grown to more than \$1 million in just four years. The fund is used primarily for low-interest rate, short-term, deferred construction loans, which provide needed gap financing for affordable housing development in rural areas.

Recently, RNA joined with the Department of Agriculture's Rural Housing Services' Rural Home Loan Partnership (RHLP) to partner with financial institutions to leverage and maximize USDA's Section 502 programs and access the community facilities fund in order to provide opportunities for very low-income households to become homeowners in America's poorest rural communities. Twelve NeighborWorks® organizations were awarded over \$4.2 million in Section 502 monies to assist the building and renovation of 113 housing units.

At present, Neighborhood Reinvestment Corporation is also involved with the Rural Housing Services to develop the first of a series of training sessions to educate and connect interested community-based organizations with financial institutions about the Section 502 programs. During the training sessions, there will also be opportunity to learn about successful case studies of how these programs have made a difference in rural communities. The first training session is scheduled for April 28, 1999, in Memphis.

OVERVIEW OF THE NEIGHBORWORKS® SYSTEM

In order to comprehend how we plan to meet the ambitious goals we have set for fiscal year 2000, it is important that you understand how the NeighborWorks® system operates and what makes it successful.

The NeighborWorks® Network

At the heart of this system is the NeighborWorks® network, consisting of 184 locally directed partnerships composed of community residents and the business and public sectors, serving more than 825 communities nationwide. Often known as Neighborhood Housing Services, each NeighborWorks® organization's local board of directors establishes strategies for revitalization of their neighborhoods and community. NeighborWorks® organizations share common characteristics:

- Led by a board of directors composed of local residents, financial and business sector leaders, and public officials;
- Are state-chartered, not-for-profit organizations with 501(c)(3) status;
- Operate a flexible revolving loan fund;
- Work with conventional lenders to develop flexible loan products;
- Promote physical, economic and social revitalization of designated target areas;
- Create and sustain affordable housing;
- Meet Neighborhood Reinvestment chartering and ongoing performance guidelines; and
- Develop and support strong resident leaders who work to enhance the viability of their communities.

Our belief is that home ownership in strong, healthy neighborhoods gives residents an equity stake in the economic mainstream of America, building long-term assets for their families as well as their communities. Home ownership also improves city tax bases, creates an environment for reputable lending and insurance firms, stabilizes school attendance and builds a positive social environment. However, the full benefit of home ownership accrues to communities only when these homes become secure investments that have at least a strong potential for asset accumulation for the buyer. When they do, the buyer, their neighbors on the block, and the overall neighborhood all benefit. To make sure that revitalizing communities receive the full benefits of home ownership, it is important to create a strong nucleus of buyers as well as default-resistant owners.

Neighborhood Reinvestment Corporation

Created by Congress in 1978, Neighborhood Reinvestment's mission is to encourage, support and facilitate these organizations' efforts to revitalize distressed communities through the local public/private partnerships. We do this through:

- Technical assistance—delivered by specialized practitioner experts geographically placed around the country in nine district offices;
- Flexible grants—to capitalize and operate revolving loan funds;

- Training—“how-to,” nuts-and-bolts coursework for community-based practitioners; and
- Our secondary market, Neighborhood Housing Services of America (NHSa)—a unique secondary market backed by national investors. This ensures the local liquidity of revolving loan funds.

We also manage the risks inherent in the NeighborWorks® system through a multifaceted risk management system. In essence the risk assessment system backs up strong local board leadership that monitors local financial controls, programmatic activities and program changes.

Neighborhood Housing Services of America

The NeighborWorks® system's unique secondary market, Neighborhood Housing Services of America (NHSa), serves as a financial backstop to local NeighborWorks® organizations' loan funds. Each NeighborWorks® organization may sell loans to NHSa at whatever rate and term is locally affordable. This kind of secondary market outlet ensures a continuous source of capital through the local revolving loan fund, which, in turn, enables local organizations to utilize the plentiful private sources of capital that are available for conventional lending. Last year \$80 million in lending from revolving loan funds sparked an additional \$740 million in coordinated private and public lending. NHSa enables us to continuously meet the capital liquidity needs of the NeighborWorks® network.

Together, Neighborhood Reinvestment and NHSa assist in the growth and capacity development of local NeighborWorks® organizations to meet the capital, technical and organizational needs of their communities.

REVOLVING LOAN FUNDS

The engines that drive this system are the flexible local revolving loan funds. Neighborhood Reinvestment provides seed capital to attract additional capital that may come from local banks, insurance companies, local government, foundations and other investors. Each NeighborWorks® organization sets its own underwriting terms and policies. The loans made from the revolving loan funds fill the gaps in an otherwise-fragmented set of resources available to lower-income borrowers. Local determination of best use and the flexibility of these funds together comprise the critical resource for broader community revitalization. For example, the revolving loan funds are used for:

- Gap financing—used in conjunction with conventional loans to assist families rehabilitate and purchase their homes ;
- Equity capital—to secure blighted properties for rehabilitation and sale, secure mutual or rental units as well as purchase property for future rehab or development.
- Major rehabilitation, minor repair and emergency loans—used to help existing very low-income and frequently elderly homeowners maintain their homes and avoid the predatory lending scams that often target this population;
- First- and second-mortgage loans—for those buyers who cannot fully qualify conventionally; these loans are tailored to the buyers' ability to repay;
- Down-payment and closing costs for first-time homebuyers; and
- Economic development—for small business start-up or expansions.

The revolving loan funds serve both as a capital resource for the community and as a way of attracting and securing private investment. In fiscal year 1998, investment from NeighborWorks® revolving loan funds rose by 23 percent, from over \$65 million in fiscal year 1997 to over \$80 million in fiscal year 1998.

CONCLUSION

The NeighborWorks® system has proven to be an effective mechanism over time to revitalize distressed communities nationwide. It has improved its efficiency and effectiveness over its 20-year history in leveraging limited public funds with private capital. In 1994, total public- and private-sector investments totaled \$268.4 million; in 1998, total investments in distressed communities amounted to more than \$820 million.

In fiscal year 2000 and beyond, Neighborhood Reinvestment and Neighborhood Housing Services of America look forward to continuing our mission to support NeighborWorks® partnerships of residents and private-sector and public-sector leaders as they work to revitalize distressed neighborhoods and communities in rural, small town, suburban and urban settings.

We are extremely grateful for the Committee's support and look forward to a successful year and continued opportunities in fiscal year 2000.

SELECTIVE SERVICE SYSTEM

PREPARED STATEMENT OF GIL CORONADO, DIRECTOR

INTRODUCTION

As we approach the millennium, I am enthusiastic about the future of the Selective Service System. Fiscal years 1998 and 1999 so far have been banner years. The Agency's accomplishments reflect the professionalism of our modest number of full-time and part-time employees and the dedication of nearly 11,000 part-time civilian volunteers. I am proud to say that the Selective Service System stands ready to mobilize national manpower should the President and the Congress decide a draft is needed for a crisis that may exceed the capabilities of America's standing Armed Forces.

Although Selective Service is a compact Agency with a modest annual budget, it continues to furnish America's only time-proven defense insurance policy. Since World War II, every President, every Secretary of Defense, all the Armed Services chiefs, key Members of Congress from both sides of the aisle, national veterans and patriotic organizations, and more importantly, the American people, have all agreed that the Selective Service System must remain in place to underpin America's role as a beacon of freedom and strength in a turbulent world.

But the Selective Service System is far more than just a defense manpower insurance mechanism. For present and future generations of America's young men, it represents a very critical link between society-at-large and today's volunteer military. It is a reminder that, as Americans, every young man is personally responsible for "providing for the common defense." Each and every day, Selective Service is a reminder to the world that, if necessary, we will defend our Nation as our fathers, grandfathers, and great grandfathers have so gallantly done in the past.

The President's budget request for fiscal year 2000 proposes funding the Selective Service System at \$25,250,000. This is the third increase since fiscal year 1995. Numerous tradeoffs and adjusted priorities were implemented to accommodate constrained resources since fiscal year 1995. Notwithstanding, at the current level the Agency continues to perform its statutory missions.

AGENCY PURPOSE

The Selective Service System remains ready to furnish its primary customer, the Department of Defense, with personnel for military service in a national crisis. It also remains ready to implement an Alternative Service Program for conscientious objectors. Consequently, Selective Service is a vital component of national defense preparedness for our Nation. Its missions, organizational structure, and programs have been thoroughly and repeatedly reviewed since 1990. Each review also embodied the principles and objectives of the ongoing National Partnership for Reinventing Government. Most recently, the Agency's missions and structure were analyzed and evaluated, leading to a September 1997 General Accounting Office report which provided two alternatives: suspending active registration and placing the Agency into "deep standby." Ultimately, any decision to change Selective Service would require policy judgments that involve other considerations, some of which cannot be quantified, in addition to cost and time required to respond to a national emergency.

I am proud of the workforce's uninterrupted professional response and its sustained national security contributions. The employees of the Selective Service System continue to do the public's business with demonstrated enthusiasm and focused commitment. And for my part, I continue to manage the Agency austere, looking for cost savings and greater programmatic efficiencies through information technology and staffing levels.

RECENT PROGRESS IN CUSTOMER SERVICE

Since I last testified before this committee, there have been a few dramatic and dynamic changes with regard to serving our customers. Four are most noteworthy because they provide the public with effective service and satisfy the Congressional charge to Federal agencies to evolve into performance-based organizations.

- Young men are able to register on-line, and anyone can verify a registration at our web site. <http://www.sss.gov>. These new options are major accomplishments in customer convenience, speedy operations, and greater accuracy of data.
- We continue to streamline our authorized full-time and part-time workforce, achieving a net reduction of over 19 percent in civilians and over 13 percent in part time military staffing. This continues in concert with the Government

Performance and Results Act objectives and mandated strategic and performance measurement planning.

- Extensive registration improvement campaigns were conducted in 21 geographic areas across the Nation experiencing low registration rates. Focused chiefly in America's inner cities, efforts not only garnered registrations which add to the fairness of any future draft, but they also protect Federal and state benefits for young men, many of whom are minorities or disadvantaged.
- Twenty-seven states now have laws which reinforce the Federal requirement to register with Selective Service. In these states, the laws vary, but they generally condition student financial aid, public college enrollment, and government employment upon a young man's compliance with the national registration obligation. The new state laws and several similar municipal ordinances increase a young man's awareness of the registration requirement.

AGENCY AREAS OF EMPHASIS

Program and Performance Measures.—In concert with the requirements of the Government Performance and Results Act, as coordinated by OMB, the Agency has identified numerous measurable performance goals that define and qualify many expected program accomplishments for fiscal year 2000. The goals reflect programmed levels of accomplishment which are consistent with the funding and resource levels contained in the President's Budget. Additionally, measures identified in the Selective Service System's fiscal year 2000 Performance Measurement Plan, define annual progress toward the achievement of particular goals and objectives also delineated in the Agency's fiscal year 1997–2002 Strategic Plan. Measures of performance effectiveness are: qualitative improvements over specific time frames; more accurate and faster turnaround of data; lower levels of personnel staffing; improved customer services; and the completion of all Y2K requirements. Recently, the White House commended Selective Service on its excellent progress in addressing Y2K issues. With the application of ever evolving communications, software and hardware technologies, the Agency continues its mandate to accomplish its missions smarter, better, and more cost-effectively.

Registration Improvement & Public Awareness.—For some time we were aware that our registration rate has been declining over the past several years, but it is only in 1999 that we saw the first big drop. For calendar year 1998, it appears that we are about 2 percent under 1997. Consequently, we are about 89 percent for ages 18 thru 25. This concerns us because we believe that once you fall below 90 percent compliance, the public would perceive our system as unfair. The public would believe, rightly, that not everyone who should be in the pool is there; and therefore those who are there, are disadvantaged because they are more vulnerable to be called. This is why I have placed such a priority on raising the registration rate.

Recognizing this trend, we implemented aggressive steps to correct the situation, such as focused blitzes in low registration areas. Naturally, the resources are traded off among other programs. However, if additional resources became available, we would expand mass mailings to targeted zip codes with low registrations. Further, we would develop and distribute more public service broadcast messages to specific markets, together with new focused printed materials. And finally we would expand our efforts to maximize tape matching programs and partnerships to identify potential nonregistrants. I estimate that the cost would be about \$1.00 additional per registration, or a total of about \$2 million. And any registration does triple duty: it documents that a man complied with the law, it preserves a young man's eligibility for Federal/State benefits, and it provides men with information about military service. It would take SSS about \$5.00 to contact the same young man that DOD does for \$13,000.

The Agency is strengthening its programs aimed at improving registration rates. Already underway are advanced registration improvement efforts. Again this year, Selective Service is making a strong attempt to reach young men in selected states where registrations appear to be low. Registration improvement "blitzes" are being scheduled to publicize the peacetime registration requirement. We strive to reach the unregistered, not only to assure fairness and equity if there needs to be a future draft, but because the law requires a man to register with Selective Service to remain eligible for student loans and grants, most Federal jobs, and training under the Department of Labor's Job Training Partnership Act. No man should unwittingly deny himself these opportunities. To support this effort, additional radio and television public service announcements (at no cost for airtime) in English and Spanish are being distributed nationally to relevant communities. These high-quality products have received laudatory comments from viewers around the country and are receiving no cost annual air play commercially valued at over \$2 million.

Selective Service maintains a home page on the World Wide Web (<http://www.sss.gov>) where registration and other Agency information is now available to anyone with access to the Internet. A convenient and highly efficient method of registration is the recent provision for the public to register through the Internet. Our fiscal year 1999 goal of providing an on-line capability for a man to register and immediately receive his Selective Service number was achieved on December 2, 1998. This efficient method is averaging about 15,000 registrations per month. That average will increase as more men become aware of the capability to "Save a stamp. Save time. Register on -line." Selective Service continues to expand its Web Page with other Federal agencies to enhance public education and customer responsiveness. Site content is constantly being improved. On-line now is the capability to verify a man's registration status. It can be used by anyone or any organization, such as colleges, universities, state and Federal agencies. The purpose of all these changes is to provide outstanding service to our customers: service which is responsive, convenient, and more timely.

Information Technology (IT).—We are also investing in IT as the vehicle to improve customer services. Modernization of the Agency's technology infrastructure began in fiscal year 1997 and is planned to continue through fiscal year 2003. In accordance with the requirements of the Information Technology Management Reform Act of 1996 (Clinger-Cohen Act), the Agency is developing an IT architecture that describes the work of the Selective Service System, the information it uses, and the IT needed to carry out its missions. Aligned with these efforts is the Agency's capital planning initiative which is also being developed to satisfy the Act. Further, our Information Management Modernization Plan focuses on adding new information technologies and Y2K mandates to the Agency's infrastructure. This is mainly driven by changing customer needs and revised government requirements. The goal of upgrading the Agency's IT platforms is based on reengineering critical mainframe computer systems while targeting other systems for use on small computer platforms. Integrating the Selective Service mainframe computer systems into more user-friendly client/server applications is our strategy over the next several years with the potential to move off of a large mainframe. Selective Service has modified its computer application programs to be Y2K compliant. These programs have been tested and validated by in-house staff. Independent validation and verification is underway by a contractor. These are the type of proactive efforts which the White House recently characterized as "excellent progress."

By embracing change and applying technology, Agency activities are leading toward a paperless work environment and a more economic means of doing business. We are exploring and implementing new methods of sharing information with other government agencies to verify Selective Service registrant data. This is necessary to verify that men are eligible to participate in state and Federal benefits in accordance with the Solomon Amendment to the Military Selective Service Act and the Thurmond Amendment (5 U.S.C. 3328). As the Agency moves forward with its IT improvements, updated and appropriate performance measures are being employed to monitor progress toward the attainment of objectives and milestones.

Revamping these systems will pay important dividends in end-user productivity and better service to customers. The Selective Service System is confident that its IT initiatives will improve customer service and increase the productivity of the Agency's workforce.

SUMMARY

Today, Mr. Chairman, the Selective Service System stands prepared to perform its crucial, time-tested responsibilities if directed to do so. The missions of this small Agency are even more fundamental to our National Military Strategy as the United States deploys its Armed Forces in ever more scattered world trouble spots and as recruiting and retention for our volunteer military become more challenging. The Selective Service System remains resolute in its rightsizing and streamlining of operations. The fiscal year 2000 appropriation request of \$25,250,000 will be invested very prudently in one of the Nation's greatest security assets. Its rationale for existence and its credentials are the same: a compact structure with the means to provide manpower to our Armed Forces as required in a national emergency, and to do it timely, fairly, and equitably.

I am especially proud to lead a dynamic and productive Selective Service System. I can assure you, Mr. Chairman, that with the ambitious efforts underway, America is maintaining a low-cost insurance policy against underestimating the nature and size of future threats our Armed Forces may face. Selective Service has accomplished much since I last appeared before this committee. My pledge to you is that our achievements this year and next shall be even greater.

Thank you, Mr. Chairman.

COMMUNITY DEVELOPMENT FINANCIAL INSTITUTIONS

PREPARED STATEMENT OF THE COALITION OF COMMUNITY DEVELOPMENT FINANCIAL INSTITUTIONS

Chairman Bond, Senator Mikulski, and distinguished members of the Subcommittee, thank you for the opportunity to submit testimony on the President's budget request for the Community Development Financial Institutions (CDFI) Fund. The President has requested \$125 million for the CDFI Fund in fiscal year 2000. The CDFI Coalition, representing more than 465 CDFIs working in all 50 states, urges you to support the President's full request.

The CDFI Coalition formed in 1992 to respond to initiatives by the Administration and Congress to support CDFIs. We served as a primary resource in drafting the legislation that created the CDFI Fund. Since that time we have devoted our efforts to building public and financial support for the CDFI industry through advocacy, public education, knowledge building, and outreach. The CDFI Coalition represents community development loan funds, community development banks, community development credit unions, microenterprise lenders, and community development venture capital funds. Together our members have loaned and invested some \$4 billion in our nation's most distressed communities.

WHAT ARE CDFIS?

CDFIs bring private sector capital to bear on problems that have historically required public sector solutions. CDFIs emerged in response to the credit and capital-related assistance needs of our nation's most economically and socially distressed and disinvested rural, urban, and tribal communities. Their purpose is to create permanent solutions in these communities. They are bridge institutions that link unconventional borrowers and conventional financial institutions. They all have community development as their primary mission and carry out that mission by financing businesses and community facilities, job creation and development, and affordable housing in low and moderate-income communities.

The government did not create CDFIs. Some CDFIs have histories stretching back five decades. These organizations are the responses of hundreds of local communities to fill market niches that banks and other conventional financial institutions do not. They are based on bipartisan principles of building private markets, creating partnerships, and providing the tools to enable poor individuals and communities to become self-sufficient and stakeholders in their own future.

WHY IS THE CDFI FUND IMPORTANT?

The CDFI Fund is a unique government effort created to capitalize financial institutions committed to serving and improving low-income and low-wealth communities. The Fund bolsters economic development by investing in and assisting CDFIs. By investing in institutions, not just projects, the Fund helps CDFIs better respond to their markets by increasing their ability to manage risk, to enhance capacity, and to be flexible in their financing. With capital from primarily private sector sources, CDFIs excel in using sound business practices to leverage conventional, private financing into poor communities.

Support of these organizations through the CDFI Fund makes the most effective use of limited federal resources. It uses relatively small amounts of federal money to leverage significant amounts of private and non-federal dollars, promotes private entrepreneurship and encourages self-help and self-sufficiency.

WHAT HAS THE CDFI FUND ACCOMPLISHED?

The CDFI Fund has been innovative, investment-oriented, and business-like in approaching its funding. Through its rigorous review process, the Fund has made awards that have provided opportunity and insisted on institutional viability. Recognizing that there are diverse organizational levels, the Fund has established different windows for participants. In addition to the "Core CDFI Program," the Fund has implemented an "Intermediary Program" through which organizations in need of assistance can participate through CDFI intermediaries, and a "Technical Assistance Program" which offers financial support to CDFIs working to build their organizational capacity.

The CDFI Fund has been productive and successful in issuing its first three rounds of awards. Thus far, the Fund has awarded \$122 million to 117 CDFIs through its Core Program Component, \$3 million to 70 CDFIs with its Technical As-

sistance Program, and has reached more than 200 CDFIs through its \$7 million invested in CDFI Intermediaries. The Fund has also awarded \$58 million to more than 170 banks and thrifts through the Bank Enterprise Awards Program resulting in more than \$700 million in direct financing services in distressed communities as well as \$271 million invested in CDFIs. Through these awards the Fund has built a balanced national portfolio of urban and rural and large and small CDFIs with geographic diversity.

WHY CONTINUE TO SUPPORT THE CDFI FUND?

CDFIs, their borrowers, and the communities in which they work need the capital that the CDFI Fund offers. Support for the CDFI Fund is essential to their vital work. Increased support will enable CDFIs to continue to rebuild and revitalize our nation's communities. From its survey of its First Round Core Program awardees, the Fund's initial findings illustrate the significant impact of the Fund's assistance on CDFIs. Collectively, this group of 30 CDFIs has taken a \$34 million investment and turned it into \$565 million in loans and investments to help create or expand 1,148 businesses and 1,895 microenterprises; create or retain more than 12,000 jobs; and develop more than 8,600 affordable housing units and 285 community facilities.

The CDFI Fund offers the combination of increased access to capital and the institutional capacity building that is vital to CDFIs and, through them, to our nation's distressed communities. CDFI Fund's programs are consistently oversubscribed. In the midst of its growth the CDFI industry is experiencing substantial demand. In the first three rounds of Core Component awards, over 560 CDFIs have requested more than \$662 million. The Fund has awarded a total of \$119.5 million, barely eighteen percent of the funds requested.

An increased appropriation to the CDFI Fund generates substantial private dollars to distressed communities. In an analysis of its 1996 Core Program awardees, the Fund found that its First Round investment resulted in CDFI asset growth of 122 percent, increasing from \$473 million to \$1.05 billion by 1998. CDFIs are very successful at leveraging private dollars. They build bridges between conventional financial services and unconventional borrowers and often work where banks do not. The dollar for dollar match required by the CDFI Fund represents only a fraction of the long term leveraging potential of this program. Every dollar of CDFI equity investment can leverage up to \$50-\$100 into low-income communities.

CDFIs will continue to benefit from the CDFI Fund's Training and Technical Assistance Initiatives. A key part of the Fund's institution-building mandate is its training and technical assistance initiative. No issue is more critical to the viability of this much-needed industry than building its human capacity. The CDFI Coalition, with a Ford Foundation grant, conducted an extensive study of the human capacity needs of the CDFI industry. Our findings stressed the need for training and proposed efficient and economical approaches to enhance the industry's performance.

With increased support the CDFI Fund can broaden its reach and impact, enabling CDFIs to better reach poor communities. The CDFI Fund can and should maintain a blend of emerging and mature CDFIs by creating a Small and Emerging CDFI Access Program (SECAP) as part of its core CDFI Program Component. SECAP would fill a gap between the Core Program and the Technical Assistance Program. By providing access to limited capital assistance with a streamlined business plan, flexible matching requirements and training and technical assistance funding, SECAP will greatly expand the Fund's potential customer base.

Given the demand and success we have described above it is appropriate for the Congress to continue to invest in this program. We are strongly urging you to provide increased support by appropriating the full \$125 million requested by the President. In this era of scarce resources it is incumbent upon the government to use those resources strategically and effectively and to maximize their impact. The CDFI Fund can use its support to enable organizations with proven track records to expand and diversify their services, grow responsibly, and sustain themselves over time.

NONDEPARTMENTAL WITNESSES

[CLERK'S NOTE.—The following testimonies were received by the Subcommittee on VA, HUD, and Independent Agencies for inclusion in the record. The submitted materials relate to the fiscal year 2000 budget request.

The subcommittee requested that public witnesses provide written testimony because, given the Senate schedule and the number of subcommittee hearings with Department witnesses, there was not enough time to schedule hearings for nondepartmental witnesses.

DEPARTMENT OF VETERANS AFFAIRS

PREPARED STATEMENT OF THE JOSLIN DIABETES CENTER

Mr. Chairman, thank you for this opportunity to submit a statement for the hearing record for the VA concerning fiscal year 2000 funding. The purposes of this statement are for Joslin Diabetes Center (1) to provide the Committee a status report on the VA's participation in the joint Joslin/DOD/VA Diabetes project funded through DOD appropriations for the past two years; and (2) to request direct funding through this bill of \$2 million for fiscal year 2000 for the VA to expand the pilot program into new VA regions and facilities.

Background

Attached are background fact sheets on Diabetes, Joslin Diabetes Center, and the Joslin Vision Network (JVN).

By the end of fiscal year 1999, the Joslin/DOD/VA Diabetes Detection, Prevention and Care Project will have accomplished the following at selected VA sites:

In Hawaii, we have set up the Joslin Vision Network (JVN) at the Honolulu VA Clinic and the Tripler Army Medical Center.

The Joslin Diabetes Outpatient Intensive Treatment (DO IT) program has been deployed in Hawaii where the first DO IT implementation practice program with patients was completed in December.

At New England VA (VISN-1), we have the JVN located at the West Roxbury/Boston and Brockton VA Hospitals with Togus, Maine scheduled for mid-summer deployment.

The JVN has been deployed at the West Roxbury/Boston VA Hospital.

Research protocols for the JVN and DO IT programs have been cooperatively developed and are in the early stages of implementation. From these pilot models, we will develop evidence based practice models that can be implemented effectively in current and future additional sites.

The clinical studies and trials that validate this treatment and detection protocol for VA and DOD implementation for the JVN and DO IT programs will commence in New England in May and in Hawaii in July.

Fiscal year 2000

DOD Funding

For the fiscal year 2000 project phase through requested DOD funding, we have planned the following tasks, targets and activities:

- The three fully operational JVN sites in Hawaii will utilize Tripler Army Medical Center as the Reading Center.
- Tripler will provide the DO IT program on a monthly basis for military personnel, families and veterans.
- The three Image Acquisition Sites for the New England VA will utilize Joslin as the Reading Center component.
- The VA Hospital in West Roxbury/Boston will provide one DO IT program on a monthly basis for veterans and family members.

—All research protocol trials will be completed while new phases will be developed for the program evaluation component.

VA Funding

With the support of VA policy and program officials, we propose to enhance the VA component of the program. The VA and Joslin have developed a plan to expand the research and clinical trial protocols and to establish and implement Joslin Diabetes Detection, Prevention and Treatment programs in an additional region to serve a new veterans population group.

Fiscal Year 2000 Program Summary

Under current plans, and the pending request for a DOD funded program, use of the JVN equipment and the expansion of screening opportunities in three VA regions will be the focus for fiscal year 2000 activities. The advancements in VA and DOD capabilities to detect and treat diabetes will result in health care benefits and cost savings to patients. This also results in cost savings to the health care systems of VA and DOD. The real thrust of the program's importance is not the introduction of the new equipment and techniques—the real importance is the use of the detection equipment and education in treatment protocol that minimize the incidence and severity of the impact of diabetes.

Following the expansion of the JVN and the incorporation of the DO IT protocol within the three regions planned for fiscal year 2000, Joslin will provide technical assistance in file management, patient follow up and monitoring, and the design of long term studies to measure the impact of the introduction of these two new elements (JVN and DO IT) into the VA and DOD medical networks and infrastructure.

Joslin will also work with VA and DOD medical personnel on developing documentation for use in other VA/DOD locations and with their respective geographically adjacent civilian populations. The promise of the pilot programs lies in their ability to reach the civilian population outside the traditional medical systems and in their expanding use within both the VA and DOD.

The VA enhancement funds we are seeking—\$2 million through the VA-HUD Appropriations Act—will permit the VA to treat more patients with the improved methods, techniques and technology derived from the base DOD funded pilot program. This enhancement will enable the VA to better accomplish its health care mission, and result in reduced agency and patient costs and improved patient treatment.

Fiscal Year 2000 Joslin Diabetes Center Funding Request—\$2 Million

Joslin Funding Summary

VA Program Participation Costs (expanded)	\$1,000,000
Joslin Diabetes Center Program Technology Development	500,000
Joslin Diabetes Center Program Participation Expenses	500,000
Total, Joslin/VA Project Cost	2,000,000

Summary

The proposed expansion of the Joslin/DOD/VA project with the VA will provide for the continuing improvement of health and costs related to diabetes for the Department of Veterans Affairs for a wider population group. We are grateful that we have the policy and programmatic support of the VA in our efforts. We understand that the VA supports this request for an additional \$2 million.

Conclusion

Mr. Chairman, expansion of this cooperative effort in fiscal year 2000 will cost \$2 million for the expenses of both Veterans Affairs and Joslin Diabetes Center. We respectfully request that you carefully consider the potential program benefits and cost savings associated with this modest investment for fiscal year 2000 funding. We are pleased to be a part of this project with the Department of Veterans Affairs and appreciate your Committee's support.

Thank you again for this opportunity to submit this statement for the hearing record.

STATEMENT OF THE RETIRED ENLISTED ASSOCIATION

On behalf of The Retired Enlisted Association's (TREA) National President Fred Athans and National Auxiliary President Ethel Hale as well as over 100,000 members and auxiliary, we appreciate the opportunity to testify before this subcommittee

concerning fiscal year 2000 Department of Veterans Affairs Appropriations. TREA is a federally chartered Veterans Service Organization (VSO) representing retired, active, guard, reserve and family members who are serving or have served in every component of the Armed Forces of the United States: Army; Marine Corps, Navy, Air Force, and Coast Guard. There are several issues which affect the members of this organization, and all veterans, that will be impacted by the actions of this subcommittee. These issues include:

VA SUBVENTION

Increased access to health care for military retirees is TREA's greatest concern. The majority (sixty-one percent) of our members are over the age of 65 and have been disenfranchised from their "earned" military retiree health care benefit. That is why TREA supports legislation authorizing the Department of Veterans Affairs to receive payments from Medicare to serve Medicare-eligible veterans (including military retirees). The Senate has already included a demonstration program in S. 4, the Soldiers', Sailors', Airmen's, and Marines' Bill of Rights. The VA Subvention program would be a good step in the direction of improving retirees access to health care. Further, the VA Subvention program would help all those veterans who are on Medicare, not only military retirees. As we work with the Ways and Means Committee on this issue, we are hopeful that the members of this committee, the advocates for veterans in Congress, will support VA Subvention when it is addressed in the House of Representatives.

Due to the fact that Medicare Part "B" would be a requirement of VA Subvention, TREA supports legislation which would eliminate the penalty for military retirees that did not elect Medicare Part "B" and now wish to enroll. Unfortunately, many military retirees were counseled by active duty hospital representatives not to enroll in Medicare Part "B" stating that their care at military health care facilities would continue for the rest of their lives. Today, however, we have seen several rounds of base closures which have left hundreds of thousands of military retirees without quality health care. Waiver of the Medicare Part "B" penalty and opening VA Hospitals to Medicare-eligible retirees will help correct this situation. Again, TREA recognizes that this issue falls under the jurisdiction of your colleagues on another Committee but we need your support, as advocates for veterans on this important issue.

LONG TERM HEALTH CARE

H.R. 1432, recently introduced in the House by Representative Kelly of New York calls for public funding of long term health care for veterans with a service connected disability rating of 50 percent or higher. While the Department of Veterans Affairs has been providing long-term care for veterans for many years out of its annual health care appropriation, the increasing cost of health care makes it imperative that Congress provide the funding to carry out this mission. Congress can not allow this benefit to cease due to a lack of funding.

CONCURRENT RECEIPT

Presently, military retirees pay is being off-set based on the percentage of VA disability they receive. As such, military retirees are the only class of American citizen required to waive their earned retired pay, dollar-for-dollar, to receive VA compensation for service connected disability. There are numerous bills pending in the House of Representatives to eliminate this off-set. TREA supports any legislation which would address this disparity which exists. We support the same treatment of military retirees as U.S. citizens with service connected disabilities. The support of the members of this subcommittee would be appreciated when your colleagues on the Defense Appropriations Subcommittee address this issue.

VETERANS BENEFIT ADMINISTRATION

Following along with the issue of Concurrent Receipt is the existing backlog in the processing of claims for a VA disability. The current wait is, in a word, shameful. It is an understood fact among veterans that if you do not have a Veterans Service Officer working for you, your claim will not be acted upon by adjudicators for a considerable period of time which may last for years. Veterans with service connected disabilities should not be discouraged from applying for their earned entitlement to disability compensation because they know that the system will be working against them. TREA was pleased to hear the Department of Veterans Affairs plans to hire more claims processors in fiscal year 2000. However, we remain skeptical that these additions will have enough of an impact to truly correct this problem.

The most recent figures on claims processing show that the existing backlog makes the stated goal of 74 days for a rating-related action unlikely. Further, the increasing complexity, both medically and legally, will continue to have a significant impact on timeliness. The Board of Veterans Appeals currently renders a decision within 120 days of receiving an appeal. However, the total elapsed processing time for an appeal in the first quarter of fiscal year 1999 was 968 days, and this is an improvement from fiscal year 1998! A time-frame of nearly two and one-half years is not satisfactory. TREA is pleased the VA is working to correct this delay but the fact remains that it still exists.

Outside the Department of Veterans Affairs Headquarters is a quote from President Lincoln which reads, "To care for him who shall have borne the battle and his widow and his orphan." In reality, many who have borne the battle do not receive what they earned for fighting in that battle. The process of filing a claim needs to be reviewed to ensure that veterans who deserve compensation receive it in a timely and efficient manner. Please appropriate the necessary funding to improve the claims process and the lives of deserving veterans.

COMMISSION ON SERVICEMEMBERS AND VETERANS TRANSITION ASSISTANCE

Along with many other Veterans Service Organizations, and members of Congress, TREA anxiously awaited the report of the Dole Commission. There were numerous points made by the Commission which greatly affects TREA's members. One point of particular concern is the following statement:

"Although healthcare coverage for Medicare-eligible Service retirees would be expensive, the central issue is fairness and equity, not affordability. In 1997, the Federal Government spent \$2.9 billion to provide FEHBP coverage to 1.67 million federal civilian beneficiaries aged 65 or older, and budgeted for immigrant healthcare. Thus, in the interest of fairness and equity for those who have endured the hardships and dangers of a service career, the cost of FEHBP-65 would be a small price to pay."

Military retirees cannot understand why immigrants have more health care options than themselves and their families. We believe that eligibility reform at the Department of Veterans Affairs, an issue we address later, and the previously addressed VA Subvention program would help improve this situation.

One particular area of concern for those of us who spent twenty or more years in the military is the recommendation concerning the limiting of the VA Home Loan guarantee to one use. Certainly, individuals who make the military a career may choose, at some point in time, to buy a home that meets their needs. Perhaps this may come with the arrival of a child or at a location where base housing may not be available. These servicemembers should not be forced into having to determine whether or not to buy a home while still on active duty or wait until retirement. The VA Home Loan program has been a successful program for decades. I do not doubt that a program created following World War II can use some readjustment, but to limit the program to one use will force career servicemembers into difficult decisions that their predecessors did not have to make. Instead of being a transition benefit, this could cause a difficulty veterans should not have to deal with when separating from the Armed Forces. TREA urges Congress to continue to provide full funding for the current VA Home Loan program.

The Commission has also recommended significant changes to the Montgomery GI Bill. The GI Bill is certainly one of the best recruiting tools the armed forces have today. Further, the impact it has had on society has been profound as more and more Americans have had the opportunity to earn college degrees. However, the education system in this country has changed greatly over the years. College tuition increases have nearly always doubled inflation over the past few years. That has made the pursuing of a college degree much more difficult for separating servicemembers as the value of the GI Bill has, therefore, steadily decreased. Further, education itself has changed. No longer is a four year degree the only form of higher education. Often, separating servicemembers may take a course over six months which costs thousands of dollars. The Commission's recommendation concerning the increase in the amount payable for tuition and fees along with the speeding up of payment for the GI Bill recognizes the fact that education has changed over the years.

The Subcommittee's support of these improvements to the veterans benefits package would be appreciated, not only by TREA's members, but by current and future veterans nation-wide. Further, we recognize there are numerous other proposals in the Commission's report such as merging of DOD and VA purchasing programs as well as facilities. We understand that Congress will need to study these recommendations and determine if they work in the best interest of veterans and the

country. However, the recommendations we have addressed here, we believe, are those which can be addressed immediately and will have a significant impact on those who have served our nation.

VA ENROLLMENT

TREA is very pleased with the current VA policy of enrolling all veterans for health care. This is a positive step towards showing all veterans that their nation is thankful for their service. We urge that full funding be granted to ensure that the Department of Veterans Affairs will be able to continue to enroll veterans in future years. We do not want veterans who have enrolled in the VA to be told in one or two years time that the health care they are being guaranteed today has come to an end. We are concerned, however, that disabled veterans are not receiving their guaranteed health care. TREA has been working on a particular case where one of our members, who is rated at 70 percent disabled, was told there was no space available to treat his service-connected disability. This veteran, in fact, is a priority 1 veteran, those rated 50 percent or higher. He should not have been told there is no space available due to the large number of new enrollees into the VA system. Just as it is important that all eligible veterans have access to the VA, it is more important that veterans with service connected disabilities can receive treatment and are not told there is no space available. Promising veterans care is wonderful, but not at the expense of the current patient priority system.

ELIGIBILITY REFORM

The Retired Enlisted Association supports the efforts of Chairman Stump to provide for eligibility reform concerning the enrollment categories in the Department of Veterans Affairs. Presently, many military retirees fall under Category 7, the lowest enrollment category which means military retirees, who have often lost their access to military treatment facilities, cannot access VA facilities either. Chairman Stump's proposal to create a separate enrollment category for retirees is greatly appreciated by the members of this organization and will certainly go a long way towards increasing the health care options for military retirees. Further, we believe it is a justifiable benefit for those who have dedicated twenty or more years of service to this nation. We urge members of this committee to provide adequate funding to create this special category.

FISCAL YEAR 2000 BUDGET

"Pay Go" is an expression which TREA and the other military associations have heard for years. If one program was going to be funded, its cost would have to be offset by taking money away from another program. Now, we have come to find that this is not always the case. Last year, the infamous "Highway Bill" was offset by taking \$10 billion from, among other agencies, the VA. Our members ask, why does "Pay Go" not apply to the Transportation Bill like it does to the VA and DOD Appropriations Bills? In an effort to increase funding for the Department of Veterans Affairs, TREA has supported VA Committee Chairman Bob Stump in his efforts to add additional funding for Veterans health care and other issues. The grossly underfunded budget submitted by the Department of Veterans Affairs to Congress was shameful. As the budget surplus was diced up into new programs and securing old ones, the VA saw an increase in its budget that barely kept up with inflation. That is why we must come before you today, to fight for our earned benefits that have, over the years, been gradually reduced due to a lack of sufficient funding. However, we recognize the budget agreement of 1997 limits the increase in spending which is possible. Further, as an association which represents military retirees, we fear an off-set which takes funding from the Department of Defense would have a severe impact not only to retirees and their families but our active duty troops and their dependents as well. The Budget Resolution passed by the Senate included an amendment which increased VA funding without off-sets from other Defense and Veterans programs. TREA urges this Committee to include funding levels equal to, and with the protections guaranteed, in the Senate Budget Resolution.

GULF WAR ILLNESS

Health care and disability compensation for veterans of Operations Desert Shield and Desert Storm are another area of concern for TREA. The concept of service connected disability is relatively simple. If you leave the military with an illness you did not have when you entered, you are no longer a "whole person" as defined by the VA and are, therefore, entitled to a disability rating and proportionate compensation. Many veterans of the Persian Gulf returned with symptoms of no par-

ticular illnesses or injury. In response, Congress passed legislation allowing the VA to compensate these veterans with undiagnosed illnesses.

Currently, the VA has extended the eligibility period to December 31, 2001 for compensation for undiagnosed illnesses in Gulf War veterans. We are certainly pleased that the VA has done this. We are also pleased that the GAO reported in 1998 that the VA has taken a number of steps to improve its processing of Persian Gulf claims (General Accounting Office, Veterans' Benefits, Improvements Made to Persian Gulf Claims Processing). However, the work is not finished. Let us not repeat the mistakes that were made over the issue of Agent Orange twenty years ago, where many died while studies were trying to determine the cause of their illness. We may never know what happened to our men and women who served in the Gulf. But we do know that they are sick and in need of our help. TREA would like to thank the many members of Congress, from both sides of the aisle, who have introduced legislation calling for increased research, expansion of the list of illnesses which are service connected and other issues relating to Persian Gulf illness. We sincerely hope these veterans will not be forgotten as time goes by and memories of our nation's efforts in 1990–1991 become part of history.

CONCLUSION

Mr. Chairman, distinguished Subcommittee members, we are at an interesting time in history. Through a balanced budget we have the opportunity to correct nearly three decades worth of injustice on our nation's veterans. We have been told in the past that once the budget situation is resolved, our issues would be addressed. Today, the budget issue is resolved and we are here asking that our needs be met. Veterans realize there is a budget surplus which does not have a penny directed to their programs. Why have those who put the nation before themselves been put last by the nation? Now you, Congress, have the opportunity to correct this by providing enough funding so veterans can receive their earned benefits. The Department of Veterans Affairs must receive full funding, be authorized to begin the VA Subvention program, improve veterans educational benefits and continue to treat veterans fairly and justly. By doing this, Congress can help ensure that veterans once again become prophets of patriotism and service to the nation as well as the best recruiters the Armed Forces had.

Mr. Chairman, I would like to thank you for giving The Retired Enlisted Association the opportunity to present its views on these important issues.

PREPARED STATEMENT OF THE AMERICAN HEART ASSOCIATION

YOU ARE A TARGET

Chances are heart attack or stroke will be the death or disabler of you or someone you love. Heart attack, stroke and other cardiovascular diseases are America's No. 1 killer and a main cause of disability. Cardiovascular diseases account for nearly 1 of every 2 American deaths.

The American Heart Association is pleased to provide recommendations on fiscal year 2000 appropriations for the Department of Veterans Affairs' Medical and Prosthetic Research program. This program consists of four components: Cooperative Studies Program, Health Services Research and Development Service, Medical Research Service; and Rehabilitation Research and Development Service.

YOU CAN MAKE A DIFFERENCE

The AHA, dedicated to reducing death and disability from heart attack, stroke and other cardiovascular diseases commends this Committee's support of the VA Medical and Prosthetic Research program. The AHA is alarmed that the President's budget flat funds this vital program. Enactment of this budget would severely jeopardize ongoing studies and adversely impact planned innovative research. If a no-growth budget is enacted, the VA would be negatively impacted by about \$10 million in out-year costs for previously approved research programs and \$10 million in expected biomedical research inflation. At a minimum, VA research needs \$336 million just to maintain its current level of effort. The AHA is concerned that insufficient money is being devoted to America's No. 1 cause of death—heart disease—and our No. 3 cause of death and a leading cause of permanent disability—stroke.

HOW YOU CAN MAKE A DIFFERENCE

The AHA recommends an fiscal year 2000 appropriation of at least \$360 million for the VA Medical and Prosthetic Research program. Our recommendation, con-

sistent with that of the Friends of VA Medical Care and Health Research, will allow maintenance of fiscal year 1999 initiatives and implementation of new initiatives for fiscal year 2000. The AHA challenges our government to significantly increase funds for heart and stroke research through the VA Medical and Prosthetic Research program. We strongly urge the VA to establish heart and stroke research centers to advance the battle against heart attack, stroke and other cardiovascular diseases—America's No. 1 killer and a leading cause of disability. Our government's response to this challenge will help define the health and well-being of citizens in the next century.

STILL NUMBER ONE

Heart attack, stroke and other cardiovascular diseases have been the leading cause of death since 1919. Nearly 60 million Americans—1 in 5—suffer from one or more of these diseases. Millions of Americans have major risk factors for cardiovascular diseases—about 50 million have high blood pressure, 39 million have high blood cholesterol (240 mg/dL) and 48 million smoke.

While heart disease and stroke occur at all ages, they are most common in Americans over age 65—an age group that is now about 13 percent of the U.S. population and will be 20 percent by year 2020. By the year 2020, the percentage of veterans over 65 years of age will be about three times that of the general population or 51 percent of the veteran population. The VA's planning models recognize that its aging patient population demands more care. More than 4.49 million or 16.4 percent of the veteran population reported suffering from "heart trouble" in the 1993 National Survey of Veterans. More than 990,000 or 3.6 percent of the veteran population are stroke survivors. As the veteran population ages, the number of veterans afflicted by heart disease and stroke will increase substantially.

Cardiovascular diseases put an enormous burden on our economy. Americans will pay an estimated \$287 billion for cardiovascular-related medical costs and lost productivity in 1999. No other disease costs this nation so much money and that amount is expected to increase dramatically with the growth of the senior citizen population.

INSUFFICIENT VA RESOURCES DEVOTED TO HEART AND STROKE RESEARCH

The Department of Veterans Affairs Medical and Prosthetic Research program plays an important role in heart and stroke research and deserves the strong support of Congress. In fiscal year 1998, VA support for research on heart disease was \$20 million (a 24 percent increase from fiscal year 1997), accounting for 7.4 percent of the fiscal year 1998 VA's Medical and Prosthetic Research budget. In fiscal year 1998, VA-supported stroke research represented \$4.6 million or 1.7 percent of the VA's Medical and Prosthetic fiscal year 1998 budget. In addition to its own program, the VA investigators spent an additional \$33.2 million on heart research and \$6.9 million on stroke research from outside sources.

VA HEART AND STROKE RESEARCH BENEFITS ALL AMERICANS

The mission of the VA Medical and Prosthetic Research program is to "discover knowledge and create innovations to advance the health and care of veterans and the nation." While the primary purpose of the VA health care system is the provision of quality health care to eligible veterans, VA-supported research contributes to the quality of care by bringing talented and dedicated physicians into the VA system. Discoveries from VA-supported research benefit veterans, science and the world's health.

VA cardiovascular research represents an integral part of the overall scientific effort in this field. VA researchers include many nationally recognized, distinguished scientists and several Nobel Laureates. Most recently, 1998 Nobel Prize winner Ferid Murad, M.D. for research demonstrating the role of nitric oxide in regulating blood pressure, had been supported by the VA. Several VA investigators have been acknowledged for their work in cardiovascular research. For example, American Heart Association volunteer Gerald F. DiBona, M.D. was awarded the prestigious VA Middleton Award in 1995 for internationally recognized research on kidney and cardiovascular diseases. Also, VA investigators provide core faculty support at major medical schools affiliated with VA institutions.

The Medical Research component of the VA Medical and Prosthetic Research program supports both basic and clinical research, primarily investigator-initiated peer reviewed studies. This component provides funds for support of VA-based faculty members (M.D.s or Ph.D.s) at various stages in their careers, multicenter cooperative studies—a large portion of which are cardiovascular studies—and research equipment. The presence of a VA research program aids the VA. This small, but

internationally recognized, highly competitive research program in fiscal year 1999 supports 2,165 investigators at 107 VA facilities nationwide.

VA cardiovascular research is largely clinical in nature. The VA is a major contributor to this nation's clinical research, playing a unique role in the research community because of its ability to immediately translate research findings into clinical practice.

VA-supported research has produced landmark results and revolutionized treatment in the cardiovascular area. You and your family have benefited directly for VA heart and stroke research. Several cutting-edge examples follow.

Inflamed Arteries.—Many heart attacks and strokes are the end result of atherosclerosis, the disease process that causes obstructed blood vessels. VA-supported research has shown a major way inflammation causes atherosclerosis or hardening of the arteries. Scientists have identified large numbers of a certain receptor on inflammatory cells in heart blood vessels. If researchers can create a way to block that receptor, progression of atherosclerosis might be prevented.

Heart Bypass Surgery.—In 1996, an estimated 598,000 heart bypass surgery procedures were performed on 367,000 patients in the United States at an average cost of \$44,820 per procedure in 1995. Generally, one year after surgery, 10 to 15 percent of the vein grafts used in these procedures become blocked. VA research has found that reducing the temperature of the solution used to harvest the vein grafts may stop heart arteries from becoming clogged with atherosclerosis. The study also discovered that while a daily aspirin stops artery vein blockage for a year after surgery, long-term survival depends on the extent of underlying disease before the procedure and the length of time of the procedure. In a landmark study, VA researchers found that heart medication works just as effectively as coronary artery bypass surgery for certain groups of patients with blocked arteries.

Gene Therapy May Help Heart Failure.—About 4.6 million people in the United States suffer from congestive heart failure, the leading cause of hospitalization for Americans age 65 and older. VA researchers have found in animal studies that inserting a gene in heart cells affected by heart failure started an active increase in the chemical that triggers the cells to beat more strongly. Additional research in this area could provide a new lease on life for millions of Americans. Also, VA scientists, using gene therapy in animals, increased the number of blood vessels that transport oxygen to the heart.

Stroke Risk Reduction.—About 9 percent of older Americans suffer from the most common type of an irregular heartbeat, atrial fibrillation, a risk factor for stroke. Research has shown that low doses of the blood thinner warfarin can lower the risk of stroke by about 80 percent in patients suffering from atrial fibrillation.

Stroke Survivor Improvements.—Stroke is a leading cause of permanent disability in the United States and the No. 3 killer. VA studies have produced therapies to enhance quality of life for survivors. VA researchers have created a software program to assess and treat the stroke-related speech disorder aphasia, have shown that strenuous exercise can benefit stroke survivors who are paralyzed on one side of their body, and have developed a rehabilitation procedure to restore arm movement. Researchers have identified seven pathways associated with motor recovery from stroke, allowing more precise predictions about functional recovery of stroke survivors.

Aspirin and Angina.—About 6.2 million Americans suffer from angina (chest pain) due to insufficient blood supply to the heart. In another landmark study, VA research found that aspirin cuts deaths and heart attacks by 50 percent in patients suffering from unstable angina.

Angioplasty Benefits.—In 1996, an estimated 666,000 angioplasty procedures were performed in the United States to restore blood flow to the heart by widening narrowed arteries. VA research was the first to evaluate this procedure. Results showed that after undergoing angioplasty, patients suffered less pain and can exercise longer than those taking only medication. Another study showed that clot-busting drugs produced comparable results to those of angioplasty at cost savings of \$3,000 per patient. Each year more than 150,000 people are candidates for clot-busting drugs, according to the VA.

Heart Failure Drugs.—About 4.6 million Americans suffer from congestive heart failure, the often disabling inability of the heart to pump sufficient blood throughout the body. A VA study showed that heart medications can enhance the heart's pumping ability and keep sufferers of congestive heart failure alive. These study results have revolutionized heart failure treatment.

Non-Q-Wave Heart Attack.—Of the estimated 1.1 million Americans who will suffer a heart attack this year, an estimated 750,000 will experience the non-Q-wave—EKG classification—version. VA research showed that noninvasive treatment of certain non-Q-wave heart attack survivors saves money and is just as effective or in

some cases better than invasive procedures such as coronary angiography. Higher death rates for victims were associated with invasive procedures.

High Blood Pressure.—An estimated 50 million Americans have high blood pressure, the leading risk factor for stroke and a major cause of heart attack. VA research showed that consistent with private sector statistics, physicians increase antihypertensive medicine in only 25 percent of patients and that even those patients who had their blood pressure monitored were poorly controlled. Better management of these patients will reduce the number of heart attacks and strokes, America's No. 1 and No. 3 killers, respectively. An inexpensive computerized reminder system helps doctors manage patients and cut costs.

Cholesterol.—About 39 million Americans adults have elevated blood cholesterol levels (240 mg/dL), a major risk factor for heart attack and stroke. An estimated 11 million veterans are at increased risk of heart disease due to high cholesterol levels, according to the VA. A clinical trial showed that daily use drug gemfibrozil reduces coronary heart disease risk by 22 percent with major reductions in coronary heart disease, heart attack and stroke for individuals with low levels of "good" cholesterol and normal levels of "bad" cholesterol. Results could mean cost savings because gemfibrozil is more economical than statin drugs. Also, VA research showed the effectiveness of cholesterol screening, when broken down into HDL, the "good" cholesterol and LDL, the "bad" cholesterol, for adults—even those over age 65. Another study found that the addition of soy protein to a low-fat diet substantially lowers cholesterol with moderately high cholesterol levels.

Wheelchair Aerobic Fitness Trainer.—This VA-developed trainer has become an alternative to drug-induced stress testing for cardiorespiratory fitness and coronary artery disease in people with lower limb disabilities.

Heart and Stroke Research Challenges and Opportunities for VA

The research advances highlighted above and other progress have been made possible by congressional support of the VA Medical and Prosthetic Research program. Thanks to research, no longer does a heart attack or a stroke necessarily mean immediate death. Now that more people are surviving, heart attack and stroke can mean permanent disability, costly medical attention, and loss of productivity and quality of life.

Challenges and research opportunities to advance the battle against heart disease and stroke abound. Examples of on-going VA research are highlighted below.

Heart Failure Studies.—The growing number of sufferers from congestive heart failure has earned this disease the title of "the new epidemic." VA research is examining whether the addition of beta-blockers to standard treatment reduces deaths and enhances health and quality of life of patients. If beta blockers prove to be effective against heart failure, the drug could save the VA \$9.4 million a year. Another study is creating a large DNA bank of sufferers to examine the genetic basis of heart failure. A third study, the first large scale, international, randomized clinical trial is assessing the role of digitalis in the treatment of congestive heart failure. It is evaluating the effects of this 200-year old treatment in preventing deaths from heart failure, the leading cause of hospitalization of Americans age 65 and older. Heart failure represented more than 22,000 VA hospitalizations in 1990 at a cost of about \$100 million. Results will improve treatment of heart failure.

Heart Attack Research.—An estimated 1.1 million Americans will suffer a heart attack this year. VA research is assessing the most cost-effective way to diagnose and treat suspected heart attack victims without the use of costly invasive procedures. One such procedure being examined is a computer analysis of the heart's electrical signals during exercise. Findings from this study could save money, improve health care and reduce the number of surgical procedures.

Warfarin and Aspirin Study.—Heart attack remains America's single largest killer. A VA-sponsored study is analyzing the effects of warfarin, a blood thinner, plus aspirin versus aspirin alone in reducing deaths from heart attacks. Results could save 20,000 lives each year, according to the VA.

Atherosclerosis and Iron Research.—Atherosclerosis or hardening of the arteries is a major risk factor for heart attack and stroke. VA research is evaluating the concept that too much iron in the blood stream contributes to atherosclerosis. Results of this research could revolutionize the treatment of heart attack and stroke.

Irregular Heart Beat and Stroke Drug.—An estimated 1 million Americans suffer from atrial fibrillation, the most common irregular heart beat, which causes more than 75,000 strokes a year. A VA study is evaluating the efficacy of two promising drugs in maintaining normal heart beat. Research results will enhance treatment for atrial fibrillation and reduce stroke risk.

Stroke Rehabilitation.—Stroke will strike about 600,000 Americans this year; most survivors will remain permanently disabled. Studies to enhance functional capacity and capabilities of stroke survivors are underway.

The number of VA research applications has grown slightly over the last five years, but funding cuts and/or inflationary increases severely restrict support for approved applications. For the programs, which were reviewed for fiscal year 1998 funding, more than 30 percent of approved applications were funded. Ten years ago, 50 percent of the approved applications were funded.

Through fiscal year 1999, total dollars appropriated for the Department of Veterans Affairs Medical and Prosthetic Research program have increased \$123 million since 1985 at an average annual rate of about 3 percent. However, there has been a decrease in terms of constant “1985 dollars” of \$7 million. The Medical Research programs highlighted below are of interest to the AHA.

Investigator-Initiated Studies.—During fiscal year 1999 this program will constitute 65 percent of the Medical and Prosthetic Research appropriated budget. Under the President’s 2000 budget, this program would be level funded from the fiscal year 1999 appropriated level. These investigators comprise the core of all VA research and provide the preceptorship for career development awardees.

Cooperative Studies.—In fiscal year 1999 this program supports 41 clinical trials. The VA offers a unique opportunity for cooperative studies due to close linkage among hospitals. These studies provide a mechanism by which research on the effectiveness of diagnostic or therapeutic techniques can achieve statistically significant results by pooling data on patients from a number of VA hospitals. The Cooperative Studies Evaluation Committee evaluates proposals developed by teams of VA clinicians and biostatisticians. The VA under this mechanism has supported many landmark clinical trials in the cardiovascular field (e.g., studies in high blood pressure treatment and coronary artery bypass surgery). Under the President’s fiscal year 2000 budget, this program would be level funded.

Career Development Awards.—Applications for these awards are reviewed both locally and by the VA Central Office. This program experienced a decrease in the number of awards by 58 percent from a high in 1991 of 212 awards to a low of 88 awards in fiscal year 1997. In response to the Research Realignment Advisory Committee suggested rejuvenation of this program, a review began in fiscal year 1997 for the VA’s Medical Research Service, Health Services Research and Development Service and, for the first time, Rehabilitation Research and Development Service. This will result in an anticipated 187 Career Development Awards in fiscal year 1999.

ACTION NEEDED

Today’s investment in biomedical research will lead to future returns. These returns include continued decreases in death rates from heart attack, stroke and other cardiovascular diseases, reduced federal outlays for hospital and long-term care expenses, a well-trained cadre of biomedical researchers and a more healthy and productive society.

The American Heart Association recommends an fiscal year 2000 appropriation of at least \$360 million for the VA Medical and Prosthetic Research program. Our recommendation is consistent with that of the Friends of VA Medical Care and Health Research. An appropriation of this amount will allow maintenance of fiscal year 1999 initiatives and implementation of new initiatives for fiscal year 2000. An fiscal year 2000 appropriation of at least \$360 million for this program would continue current research momentum in cardiovascular diseases within the VA and help to maintain the VA’s vital role in the overall scientific effort in this field. We strongly urge the VA to establish heart and stroke centers to advance the battle against heart attack, stroke and other cardiovascular diseases—America’s No. 1 killer and a leading cause of disability.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION FOR UNIFORMED SERVICES

INTRODUCTION

The National Association for Uniformed Services (NAUS) appreciates the opportunity to submit this statement concerning the association’s legislative agenda.

BACKGROUND

The National Association for Uniformed Services represents all ranks, branches and components of uniformed services personnel, their spouses and survivors. Our nationwide association includes all personnel of the active, retired, reserve and Na-

tional Guard, disabled and other veterans of the seven uniformed services: Army, Marines, Navy, Air Force, Coast Guard, Public Health Service, and the National Oceanic and Atmospheric Administration.

NAUS VETERANS AFFAIRS GOALS—106TH CONGRESS

The purpose of this association is to ensure a strong national defense as provided by a highly trained volunteer force. To ensure that high quality young people will be attracted to service in the armed forces the nation must ensure that adequate recruitment and retention incentives are available and that any promise of benefits to be earned by military services are honored. Unfortunately, over the past years many of the promises have been broken because of inadequate funding for veteran programs. The “breach of faith” by the government and the subsequent impact on retirees and veterans has been noticed and is affecting the numbers and quality of those considering military service—as shown by services missing their new member recruitment goals.

Health care

NAUS recommends enactment and adequate funding for legislation to authorize VA/Medicare subvention legislation on a fee-for-service basis. NAUS also supports subvention on a managed care basis as well. Both fee-for-service and a managed care component would provide for the most efficient and cost-effective delivery care.

We also recommend that Congress eliminate all co-payments for military retirees and TRICARE/CHAMPUS beneficiaries for care received in VA medical facilities and return to system whereby VA would be reimbursed by the military services for care provided to their beneficiaries. This would be a major step towards honoring the lifetime medical care promise and restore much of the faith lost in the government to fulfill its promises.

With an aging veterans population it is important that we improve the VA’s ability to provide long-term care needs for disabled and poor veterans through a combination of VA facilities for veterans requiring specialized care and expansion of long-term care contracting.

Survivor’s benefits

NAUS Strongly Urges the Principle of Replacement Income for Survivor’s Benefits Payable to Widows of Catastrophically Disabled Veterans.

The DIC payable to widows of catastrophically disabled veteran’s needs to be restructured to more closely parallel the percentage of replacement income provided by other Federal survivor’s benefit plans such as the Military’s Survivor’s Benefit Plan, or the Federal Survivor’s Annuity.

Catastrophically disabled veterans receive additional allowances because of their service-connected multiple disabilities and the family income may be \$36,000 or more a year. While living, their wives are their primary care givers and often provide skilled nursing care. However, in performing this full-time duty they are not able to work and earn retirement or Social Security benefits in their own right. In these cases both the veteran and his family are dependent totally upon income from the Department of Veterans Affairs (VA).

Consequently, after their husband’s death, the income of these widows drops to about \$10,000 to \$12,500 per year—depending upon the number of years of their husband’s total disability, and the over lapping years of marriage. In the cited examples the percentages of income replacement are 28 percent and 35 percent.

As an issue of fairness we believe the replacement income for these widow’s should parallel that of federal survivors, which is a about 50–55 percent. This change would affect about 32,000 widows of catastrophically disabled veterans.

NAUS also recommends that legislation be enacted to continue DIC payments for widows who remarry after age 55.

Education

There is now near universal agreement that the veteran education benefit is in need of sweeping reform. That statement in no way diminishes the Association’s appreciation for the improvements made to the education benefit in the last two years, improvements that are a credit to all members of this Committee. NAUS is sincerely grateful for the enhancements enacted last year, particularly for the increase of 20 percent in the basic entitlement. We would like to see the following improvements enacted in the current Congress:

- Pay eligible veterans full tuition, fees, books and supplies + \$400 per month for up to 36 months. Provide indexes for inflation and include non-institutional training.
- Eliminate the \$1200 payroll reduction.

- Allow the services discretionary authority to transfer the benefit to a family member.
- Allow service members 10-years from first enrollment to use the benefit, not to exceed 15 years from separation.
- Exempt subsistence from counting as income for purposes of loan eligibility.
- Allow accelerated lump sum payments
- Allow VEAP participants to elect MGIB if they were on active duty on October 9, 1996 and pay \$1200.

Employment and Reemployment

NAUS seeks the following improvements in veterans' employment benefits and programs:

- Congressional oversight in efforts to determine the military occupations for which it is feasible to meet civilian licensure, certification, and apprenticeship requirements.
- Equity for military retired veterans regarding military service creditable for civil service leave accrual and service creditable during reduction's-in-force.
- Improvement in the programs and services of the Small Business Administration that require special consideration for veterans.
- Establishment of programs to assist reserve and retiree entrepreneurs to sustain their business or self-employment during and to aid recovery following involuntary military service in the Armed Forces for war and contingency operations. This is especially needed in view of the immanent call up of the reserve forces to support what will be the long term operations and commitment required for peace in Kosovo.
- Repeal of the current law that inequitably imposes age restrictions on the "original appointment" to certain occupations (i.e., law enforcement, fire fighters, air traffic controllers) or amend current law to authorize a "computed age" for veterans and military retirees that credits prior military training and experience
- Repeal of the current law that prohibits civil service appointments in the Department of Defense only after 180 days immediately following military retirement.

Memorial affairs

NAUS seeks the following improvements in these final benefits received by most veterans:

- Codification of the eligibility requirements for burial in Arlington National Cemetery that includes elimination of all waivers (HR-70)
- Legislation authorizing conveyance of government land adjacent to Arlington National Cemetery for expansion of burial space
- Construction of a National Military Museum with sections for each armed service.

Concurrent receipt

NAUS seek enactment of legislation authorizing the concurrent receipt of VA disability compensation and military retired pay without an offset of either.

CLOSING

The National Association For Uniformed Services (NAUS) appreciates the opportunity to submit this statement concerning our Legislative Agenda for the 106th Congress.

PREPARED STATEMENT OF THE FLEET RESERVE ASSOCIATION

INTRODUCTION

Mr. Chairman. The membership is pleased that the Fleet Reserve Association (FRA) has been invited by this distinguished Subcommittee to present its request for funding the Department of Veterans Affairs for fiscal year 2000. On behalf of nearly 155,000 shipmates, I extend gratitude and a salute for the concern and active interest generated by you, Mr. Chairman, and the Members of the Subcommittee in providing funds for the protection, improvement, and enhancement of programs that are made available to the Nation's veterans.

Mr. Chairman, there seems to be some confusion with the name of the Fleet Reserve Association (FRA). Many believe that FRA is an organization of Reservists. Although FRA does proudly lay claim to Reservists among its membership, the majority are active duty and retired members of the Navy, Marine Corps, and Coast

Guard—collectively known as the Sea Services. Its name is derived from the Navy's program of transferring to the Fleet Reserve (Fleet Marine Reserve for Marine Corps personnel) persons who leave the service after 20 years of active duty but do not have 30 years to fully retire. During the required period of service in the Fleet Reserve, personnel assigned earn "Retainer Pay" and are subject to recall by the Secretary of the Navy.

This year FRA is commemorating its 75th Anniversary. It is the oldest and largest professional military organization exclusively serving and representing enlisted men and women of the Sea Services. It continues to seek protection and equity for those who serve or have served in the Sea Services, and those veterans requesting assistance. Since 1924, FRA has been active in pursuing Congressional and the Administration's support for enlisted quality of life and veterans' programs. FRA is proud of its service to the Nation and its veterans.

DVA FISCAL YEAR 2000 BUDGET

FRA's major goal for fiscal year 2000 is to seek increased funding for the Department of Veterans Affairs (DVA). Without additional funds, the Nation's veterans will be short-changed if the Administration's inadequate budget request is approved.

FRA's anxiety over the VA budget is well founded. In the chart below, the Association has selected a Federal Cabinet level department and several agencies whose programs may be compared somewhat to those provided the Nation's veterans. It is noted that for comparability, VA isn't getting its fair share of the Federal budget. From fiscal year 1995 through fiscal year 1998, for example, the Financial Management Service, Department of the Treasury, reports that of the five federal entities listed below, the lowest percentage increase following that of DVA is 3.6 percent greater. If a 14.2 percent increase in funds would have been provided DVA, an additional \$1.3 billion could have been used for sorely needed improvements in veterans' programs.

[Dollars in millions]

Dept./agency	Fiscal year		Percent of increase
	1995	1998	
DVA	\$37,769	\$41,776	10.6
PHS	20,725	23,670	14.2
NIH	10,883	12,501	14.8
HCFA	310,657	379,950	22.3
H&HS	303,075	350,563	15.6

Further testament to the inadequacy of DVA budgets can be found in The Economic and Budget Outlook: fiscal years 2000–2009. It cited the VA for having one of the smallest percentages in discretionary spending in fiscal year 1999. Of the nine (9) categories (not including "Other") listed under "Non-defense Discretionary Spending," veterans' benefits was seventh, 1.2 percent less than the sixth place "Natural Resources and Environment."

Additionally, the Administration on February 1, 1999 announced that DVA's fiscal year 2000 budget is \$200 million above last year's funding. \$124,141,000 of that "increase" is to be obtained through the Medical Care Collection Fund (MCCF) from third party payers. To show further disregard, the Administration included a total of \$749 million in its proposal that the DVA must collect from third party payers in order to fund improvements in veterans' health care.

In its belief that the VA budget continues to be grossly underfunded, FRA lists below the programs that should be authorized or expanded in the Department of Veterans Affairs (DVA) for fiscal year 2000. The Association urges the adoption of its recommendations and their eventual funding to assure full recognition of America's veterans and, if applicable, that they're compensated for the sacrifices made in service to the Nation and its citizens.

FRA RECOMMENDATIONS IN BRIEF

The following recommendations are submitted for consideration from the perspective of FRA's members whose average age is 67 years. Some are veterans of as many as three wars and most are retired from the Sea Services yet they are very concerned with the state of readiness of the Nation's Armed Forces and the dwindling VA budgets.

1. Appropriate funds to expand health care for all veterans to include the construction and leasing of additional nursing and long-term care facilities.

2. Provide additional funds to improve educational programs and provide voluntary open enrollment in MGIB for all current and past VEAP participants.
3. Appropriate sufficient funds to maintain and modernize cemetery facilities and equipment (including Arlington National Cemetery) and expand the number of cemeteries and burial spaces.
4. Provide support for the adoption of concurrent receipt of military retired pay with veterans' compensation without loss to either.
5. Deny funding to DVA for the enforcement of civil court orders directing the division of veterans' service-connected disability compensation and encourage the adoption of laws that will repeal the practice. And, further, to support amendments to the Uniformed Services Former Spouses Protection Act (USFSPA) as outlined in H.R. 72.
6. Support the repeal of the statute requiring the repayment of separation pays or bonuses if the recipient enlists in the Reserve components or becomes entitled to reserve retirement pay.

VETERANS HEALTH CARE

Expand Access to Veterans Health Care.—FRA seeks adequate funds for the Department of Veterans' medical treatment and care centers. The Association believes that VA health care should be open to all veterans' regardless of their ability to pay. The Association quite agrees that there must be a system granting priority access for certain veterans; i.e.—service-connected disabled at 30 percent or more; however, all veterans rated 20 percent or less, or non-rated, should be granted access on an equal basis—first come, first served.

The latter group would include non-disabled military retired veterans who were promised free medical care for life but do not now have access to military treatment facilities (MTFs). These military retirees are forced to seek treatment from other than MTF sources. Congress, through the Base Closure and Realignment Acts (BRAC), voted to close more than 50 percent of MTFs near which the retirees resided for the purpose of obtaining the benefits promised to them and their families. It is only fair that Congress allow them a higher priority access to VA health care and direct the Department of Defense to reimburse the VA for care tendered. Frankly, FRA further believes that extending equal access to veterans as suggested above will improve quality and the administration of care in veterans' health care programs.

In making its recommendation, FRA is aware of the comments attributed to Senate Report 105–216, page 14, that the “VA has underutilized capacity that will allow treatment of additional veterans . . .” For those requiring hospitalization, page 15 notes that there are an “increasing number of unused inpatient hospital beds since outpatient care is on the rise.” FRA knows that a major part of the problem is the scarcity of employees. This, coupled with complaints that the VA is either reducing, consolidating or eliminating health care services, points directly to the need to increase funding for the Veterans Health Administration (VHA).

Congress should shame President Clinton into standing by his remarks of March 6, 1995 (when he stated that his Administration “fought to fully fund [veterans] benefit programs”) and provide full funding to strengthen and enhance the VA's health care system.

Subvention and MCCF.—Addressing the latter first, FRA recommends that to aid in providing additional funding for the VA health care system, DVA should continue to collect monetary receipts through the Medical Care Collections Fund (MCCF). However, receipts or estimated receipts from this program should not be included in the VA budget.

With an estimated 66 percent of the over-65 male population in the year 2000 expected to be veterans, it should be cost-effective for the VA and the Health Care Financing Administration (HCFA) to allow Medicare-eligible veterans to voluntarily utilize VA facilities for their health care. HCFA would reimburse the VA for care provided Medicare-eligible veterans and at the same time collect from third party insurers providing veterans Medigap or other commercial healthcare policies. Instead of Medicare dollars going to a commercial entity, authorizing Medicare subvention for the VA would then become one of the major building blocks to encourage DVA to continue and expand modernization of its health care program. Further, subvention will help in the quest to “fully utilize (the system's) capacity” and “increase the use of inpatient hospital beds.”

FRA recommends that a demonstration project for the VA be authorized and funded to test the feasibility of establishing Medicare subvention programs within its health care facilities.

Tobacco-related Illnesses.—FRA recommends that the DVA be authorized and appropriated funds for the pursuit of monetary retribution from the tobacco industry. The funds obtained, if any, would be used for the purpose of establishing care and treatment for tobacco-related illnesses attributed to smoking while veterans were active members of the Nation's Uniformed Services.

The idea that tobacco-related illnesses for many veterans are not service-connected is ludicrous, especially if it pertains to those who served in combat environments. Cigarettes were once distributed free by tobacco companies and the military services and made available practically at cost in military stores. And, too, military seniors may have encouraged the use of tobacco by simply announcing, "The smoking lamp is lit."

Many service members may recall that cigarettes were a refreshing respite from the ordeal of combat, they soothed the nerves, calmed fears, comforted the wounded, eased distress in body and mind, and even aided in the subsiding of hunger pangs. The VA has been treating veterans for alcoholic and drug-related illnesses for years. Since the use of drugs is illegal, and alcohol is a craving (as is tobacco use) it's hypocritical not to treat tobacco-related illnesses and consider tobacco-related claims. FRA believes DVA need not hesitate any longer in initiating or joining negotiations against the tobacco industry for payments to support its VHA in providing the required care and treatment of affected veterans.

Nursing Homes, Long Term Care, and other Health Care Programs.—Our veterans are aging. World War II and Korean veterans are in their 60s and above. As noted above, by the year 2000 sixty-six percent of the male population in the United States will be veterans. More and more of them will become dependent upon the VA to provide the necessary care in nursing homes, domicilaries, state home facilities, and its underused hospital beds. The Nation can ill afford to wait for out-year appropriations before it expands nursing or long-term care.

The Federal Advisory Committee on the Future of VA Long-Term Care recently suggested that VA discontinue funding for the construction of nursing homes and, instead, expand contracts with home health agencies and nursing homes. FRA, however, has a problem with this approach.

In recent years there's been a rush of recommendations for Federal entities to turn over many of their operations and programs to the private sector. Some have merit, others do not. For our veterans, FRA believes that only the VA should be responsible. By placing veterans in private facilities, DVA could pass the blame to others. Still, the Association is acutely aware that some contracting is necessary. Consequently, FRA recommends the adoption of increased appropriations in fiscal year 2000 for the construction and leasing of facilities. Also included is an increase in grants to States for the purpose of constructing and operating such facilities for the benefit of its veterans.

Health Care Costs.—Recent reports by benefits consultant Towers Perrin and Hewitt Associates estimate health care costs will increase 7 to 10 percent in 1999. On average, HMO costs are rising 8 percent for enrollees without dependents. Medigap insurance premiums have soared to greater costs beginning January 1 of this year. These facts and more support the need for greater funds for the VA's health care system in fiscal year 2000. If increased funding is not appropriated, less care will be provided and quality will decline further.

Medical and Prosthetic Research.—FRA continues to support adequate funding for medical research and for the needs of the disabled veteran. The value of both programs within the veterans' community cannot be overstated. The need is there.

EDUCATION

Montgomery GI Bill (MGIB).—The MGIB is one of the major incentives for enlisting in the United States Armed Forces. It is with gratitude that FRA witnessed the fiscal year 1999 actions of the 105th Congress in increasing educational benefits for veterans eligible to participate in the program. But there are many others who should be authorized to enroll in MGIB and, for those currently in receipt of benefits, to receive increased funds that are commensurate with today's economy.

Since 1991 military operations and personnel tempo levels have increased dramatically. For example, optempo soared 143 percent since the Cold War ended. The Navy alone responded to orders to deploy 77 times during the past six years of the Clinton Administration but only 40 times during the eight years President Reagan was in office. All this with less manpower following Congress' authorizations to cut military personnel levels by more than 25 percent.

For these veterans and those who participated in the Veterans Education Assistance Program (VEAP), whether they withdrew voluntarily because it failed to offer satisfactory benefits or as a result of bad advice from senior officials, FRA believes

they should be provided an opportunity to enroll in the MGIB. Further, benefits under the MGIB should be revamped to offer benefits comparable to earlier GI Bills.

FRA continues to subscribe to (a)—the belief once offered by the Treasury Department that veterans who take advantage of their GI bill will return more money to the U.S. Treasury for every dollar spent by the Federal government for their education, and (b)—as stated by the Commission on Servicemembers and Veterans Transition Assistance (CSVTA), “a more financially attractive MGIB would enable our Nation to fully capitalize on the unique national resource of veterans’ skills, training, experience, and character.”

In relation to the MGIB and VEAP, FRA concurs with the CSVTA recommendation to improve and adequately fund the Military’s Transition Assistance Program. (See below.)

Education Benefits for Active Duty Personnel.—FRA proposes an amendment to the current practice of not providing stipends to active duty personnel pursuing education under the MGIB. If the service member has two (2) or more years of honorable active service and the inclination to enroll in a course of education after regular duty hours, he or she should be authorized a partial stipend dependent on the number of hours completed each month. Today, many Service members find that they must seek employment after duty hours in order to provide additional—sometimes every day—comforts for the family. If the member receives a stipend for enhancing his or her level of education instead of “moonlighting,” then additional strength is added to the CSVTA statement that: “America’s leadership will include veterans, only if veterans can obtain the best education for which they qualify.” FRA recommends appropriations to fund such a program.

CEMETERY SYSTEMS

National Cemetery System.—There’s no question regarding the need for expanding the VA’s cemetery system. The new National Cemetery Administration (NCA) and its predecessor have and are doing much to meet the demand for burial spaces for aging veterans who are passing away in greater numbers than ever. It could do more, but without the necessary funds, the system will never meet the demand. Further, the practice of not providing adequate funds for the system is placing many of its facilities in jeopardy. The Nation cannot afford to allow these cemeteries to deteriorate in the maintenance of its facilities and grounds and the operation of burial services for the Nation’s veterans.

FRA urges increased funding, fenced so that the NCA has exclusive use for the purchase of land, preparation, construction and operation of new cemeteries, the maintenance of existing cemeteries, and the expansion of grants to States to construct and operate their own cemeteries.

Additionally, to deter vandalism, FRA suggests funding appropriations to hire local police or security companies to patrol cemeteries during hours of closure.

Arlington National Cemetery.—FRA endorses the bill, H.R. 70, recently passed by the House, that establishes new eligibility requirements for burial in the Arlington National Cemetery. The Association requests that funds provided for the operation and maintenance of the cemetery be prohibited in their use for interments of any person or persons not meeting the requirements of H.R. 70.

Additionally, FRA supports the appropriation of funds for the future expansion of the cemetery to include portions of the property now housing the Arlington Navy Annex and any available property adjacent to the cemetery grounds.

CONCURRENT RECEIPT

FRA continues to advocate concurrent receipt of military retired pay and veterans’ service-connected disability payments without loss to either.

Oft time actions proposed for military personnel are ignored by Congress because Federal civilian employees aren’t to be recipients of like considerations. An example of this is currently being touted in Congress following the Department of Defense’s recommendation to increase military pay in fiscal year 2000 above that for civil service employees. Yet, when the shoe is on the other foot, it is rare when military personnel are granted identical benefits proposed or provided for Federal employees. These are many, but most retired military veterans cite the law that authorizes their Federal civilian counterparts to receive their government pension concurrently with veterans’ compensation for service-connected disability. Even more difficult to comprehend is the statute permitting retired military personnel, unauthorized to draw military retired pay concurrently with veterans’ compensation, may gain employment in the Federal establishment, switch his or her military retired pay to a Federal employee pension, and then be eligible for concurrent receipt of both the pension and the veterans’ compensation.

Some people argue that the reason concurrent receipt cannot be authorized is the same period of service to the Nation cannot be compensated twice. But, if this were true, why is a federal employee, who is also a member of the National Guard or Reserve, paid by the military for the annual 14 day training period and, at the same time, be a recipient of payment for his or her federal employment—plus a credit for both civilian and military retirement purposes? This is, without a doubt, dual payment for the same period of service.

(Note: This is in no way to be construed as advocating a change to the procedure of rewarding Guard and Reserve personnel who also are Federal employees.)

Another argument favoring concurrent receipt is the military's way of offering the military member little opportunity to choose non-disability or service-connected disability retirement. For example, a member of FRA had no choice but to retire under the military's non-disability provisions; his disability was rated as zero. Subsequently, within the year VA rated his disability at 60 percent. Others have retired from the military services with zero to ten percent disabilities only to have the VA grant them higher ratings. Since the military failed to offer many service members an appropriate service-connected disability rating, and the VA later gave them a much higher one, concurrent receipt in the form of H.R. 44, H.R. 65 or H.R. 303 should be given strong consideration for passage.

FRA recommends that the distinguished members of this Subcommittee actively support and encourage the repeal of 5304.(a)(1), 38 USC, and the enactment of H.R. 44.

COURT-ORDERED DIVISIONS OF VETERANS' COMPENSATION/RETIRED PAY

State Courts have been overly generous in awarding spouses and/or former spouses a portion of veterans' service-connected disability payments and military retirement pay. The former should be outlawed by Congress. Service-connected disability payments are made for the express purpose of compensating the veteran for physical sacrifices made in the Nation's military service, not by the veteran's spouse. Service-connected disability payments are to financially assist a veteran whose disability may restrict his or her physical or mental capacity to earn a greater income from employment.

FRA believes that this payment is exclusively that of the veteran and should not be a concern of the States' civil courts. If a civil court finds the veteran must contribute financially to the support of his or her family, let the court set the amount allowing the veteran to choose the method of contribution. If the veteran chooses to make payments from the VA compensation award, then so be it. The Federal government should not play the roll of the States' collector. FRA recommends the adoption of stronger language offsetting the provisions in 42 USC, now permitting Federal enforcement of State court-ordered divisions of veterans' compensation payments. Otherwise, to recommend that the appropriations process deny funds for the purpose of processing state court orders that direct the division of payments from the account of veterans who are authorized service-connected benefits.

FRA is truly grateful to the Chairman, House Committee on Veterans Affairs, and 15 other Members of this Body who are concerned that a Federal law allows the States to unjustly treat veterans with impunity. Not only does this affect the veterans described immediately above, but those entitled to military retired pay for their long and faithful service to the Nation in the uniformed services. Last year, and again early in the 106th Congress, Mr. Stump and his colleague, Mr. Norwood, had the courage to sponsor legislation that provides sorely needed equality in the treatment of military retired pay by State Civil Courts but, most importantly, by the very government to which the veteran has devoted years of honorable service.

Late last year, Chairman Stump held hearings on the Uniformed Services Former Spouses Protection Act (USFSPA). It was clear that the original law made its way through Congress under suspicious circumstances and has become a one-way weapon used by many former spouses and their attorneys to financially bleed their military spouses of outrageous sums.

A significant number in Congress speak of returning the money and power to the States, the very States that cry for more State-rights, but continue to look the other way so that Federal statutes will void the right and responsibility to enforce their own laws. FRA says; "Give back to the States not only the right to decide who is what, but the authority to enforce its own laws without using the Federal government as their 'bill collector'."

FRA strongly endorses Messrs. Stump and Norwood's proposal, H.R. 72, and urges all members of this Subcommittee to support its proposed amendments to the USFSPA which should be as fair to the military retiree veteran as it is for his or her spouse.

SEPARATION PAYS

The dismissal from honorable service in the uniformed services as a result of Congressionally-approved “downsizing” caused many mid-career young men and women to seek opportunities in the civilian sector. To ease their transition, Congress—at the urging of the FRA and The Military Coalition—agreed to provide certain separation payments for service members with six or more years of active service, but less than 20. On departure from their uniformed service, they were encouraged to join the Reserve or National Guard. However, few knew or were aware that if they eventually retired and received retirement pay, their separation pay, special separation benefit (SSB), or voluntary separation incentive (VSI) payment would have to be repaid to the Federal government. The same applies to those who later are awarded service-connected disability payments from the VA.

FRA is totally opposed to the repayments. The Association believes its shoddy treatment of the men and women who wanted a career in the uniformed services but were unable to complete that career because incumbent Administrations and Congresses did not authorize their retention.

Under current law the service member who is released from active duty and qualifies for certain pays or benefits never has to repay any portion of that stipend if he or she doesn’t qualify for veterans’ disability payments or is not accepted by the National Guard or Reserve Forces. If qualified for either, however, it’s time for pay-back. It is difficult for FRA to understand why the individual willing to further serve the Nation in uniform or is awarded service-connected disability compensation should have to repay the Federal government for that privilege. The Association recommends the repeal or the necessary technical language to amend the applicable provisions in Chapters 51 and 53, 38 USC, to terminate the requirement to repay the subject benefits. (Also requires an amendment to 1704(h)(2), 10 U.S.C.)

OTHER RECOMMENDATIONS

In the event some of the recommendations of the Commission on Service Members and Veterans Transition Assistance (CSVTA) are adopted in the authorization process, FRA submits the following comments for the Subcommittee’s consideration.

Veterans Health Care.—FRA has reviewed the recommendations of the Commission on health care and believes that some have merit. It is certainly agreeable that neither the VA nor DOD can meet the demand for health care, but this is a matter of funding. FRA does not agree with either the expansion of TRICARE or that VA beneficiaries should have access to Military Treatment Facilities (MTFs). This thinking also extends to the recommendation to provide transitional health care for recently separated service members and their families.

FRA does not support HMO-style health care for military personnel. However, TRICARE is all that is now available, but even it needs much work to improve its system of delivery. Active duty personnel and their families, for the most part, are not pleased with TRICARE. Neither are retirees and their families. Further, there is little if any space available for the latter group of beneficiaries in MTFs. Otherwise, FRA would not have recommended authorizing non-disabled military retirees to utilize VA facilities for their health care.

The current dissatisfaction with DOD’s TRICARE system is adequate reason to oppose the CSVTA recommendation to expand the program within the VA Medical Services.

Transition Assistance Program (TAP).—FRA concurs with the Commission’s recommendation to improve and adequately fund TAP. In the past few years FRA has opposed attempts by the Department of Defense to reduce this critical program that offers assistance to service members returning to civilian life when their periods of active service in the Armed Forces are concluding.

FRA believes that if the Armed Forces had an effective program it would encourage members enrolled in the MGIB to pursue their education benefits upon separation. In this respect, the Association is pleased that H.R. 4110 (Public Law 105–368) requires the VA and, in another section, military service secretaries, to “ensure separating service members are well informed of the eligibility requirements for education benefits.” However, FRA is concerned that the law is limited to service members released from active or reserve commitments at the “convenience of the government.” And, also, restricted to those enrolled only in VEAP. FRA has recommended that the language be amended to cover all departing service members whether enrolled in VEAP or MGIB.

Transfer of Education Benefits to Spouses and Children.—FRA advised the House and Senate Committees on Veterans Affairs that it was opposed to this recommendation by the Commission. The Association believes that the cost of providing education benefits to veterans’ family members will soar to new heights. It’s difficult

not to remember the years 1975 and 1976 when the high cost of funding the Vietnam GI bill caused the major veterans organizations and the Ford Administration to call for its demise. Many Vietnam veterans lost out on education benefits.

The MGIB, whose title: "All Volunteer Force Educational Assistance Program," was primarily adopted as a recruiting and retention incentive and is not so much a rehabilitation program as the GI bills designed for veterans of WW II, Korea, and Vietnam, most of whom were draftees.

The very language of 3001(4), 38 U.S.C., which FRA fully endorses, firmly establishes the MGIB exclusively for those who serve on active or reserve duty in the All Volunteer Force (AVF).

However, in discussing the issue with the senior enlisted Master Chiefs of the Navy and Coast Guard, their recommendation is to offer the transfer proposal only to those service members who reenlist and complete a minimum 20 years in the active components of the Armed Forces. The provision could very well be an excellent re-enlistment incentive.

Termination of the \$1,200 contribution (Payroll Deduction) to the MGIB.—In view of the probability that the MGIB will undergo further improvement, FRA is on record as opposed to the CSVTA recommendation to terminate the \$1,200 contributions of service members electing to receive MGIB benefits upon attaining eligibility. It believes the contribution adds an incentive for the service member to further his or her educational pursuits because of the investment made. However, in lieu of \$100 per month for 12 months, the Association recommends \$50 monthly deductions over a 24 month period. At the end of the two-year period, he or she is now eligible to begin receipt of MGIB benefits. Also recommended is the reimbursement of contributions if, at the end of the enlistment or period of honorable service, the member chooses not to participate in the MGIB. Further, if the member fails to complete the term of enlistment or service, or is in receipt of less than an honorable separation, no refund of contributions would be authorized.

Thrift Savings Plan.—FRA is also opposed to this recommendation unless it provides Federal matching funds as offered civilian employees for their participation in a similar program. Otherwise, the Association is concerned that a Thrift Savings Plan for uniformed personnel is not beneficial to most junior grades. Many have financial problems or barely manage to live within their budgets. Others work a second job after their regular duty requirements to provide day-by-day needs or additional comforts for their families. Since there is no incentive (matching funds) for junior personnel to participate, FRA believes the program will be perceived as "an officer benefit," not conducive to enhancing the morale of the troops. Again, FRA will subscribe to the program only if it has matching funds.

Refocus VA's Housing Program Toward Veterans in Transition.—FRA disagrees with limiting the VA home loan guaranty to one use. This restriction would place an undue hardship on the active duty service member and family who may wish to possess their own residence wherever assigned under military orders. To be able to do so, frees a housing unit on the military installation for a service member unable to afford a down payment to purchase a home or afford to rent a residence on the civilian market. Further, the Association believes that the veteran who becomes sufficiently affluent to upgrade his or her choice of residence should have the opportunity to do so.

Deliver Cost-Effective Services to Homeless Veterans.—FRA has concern that an inordinate amount of VA funds have been targeted to serving homeless veterans. In many cases the same veterans are in receipt of more than a fair share of existing benefits. FRA believes that the availability of rehabilitation, education and vocation programs, and the housing program established in H.R. 4110 (Public Law 105-368), are more than adequate to assist in turning homeless veterans into responsible citizens, although admittedly so, there are those who cannot be rehabilitated. Any further needs of affected veterans should be made available in the same manner as prescribed for beneficiaries of other veterans' programs.

Consolidate DOD and VA Disability Compensation Systems.—FRA isn't certain that the two systems are or could be compatible. The Association would support a study but withholds any recommendations until FRA reviews the final report. At this time, the Commission's recommendation to include "necessary changes in legislation" with the proposed report should not be granted.

CONCLUSION

Mr. Chairman. In closing allow me to again express the appreciation of the Association's membership for all that the Subcommittee has done for our Nation's veterans over these many years. FRA also is grateful for the opportunity to address the distinguished members of this panel on the issues so important to its members

and the millions of other veterans concerned that the DVA budget is inadequate. They look to this Subcommittee for a satisfactory resolution.

PREPARED STATEMENT OF THE VIETNAM VETERANS OF AMERICA, INC.

Mr. Chairman, Vietnam Veterans of America (VVA) thanks you and your distinguished colleagues for this opportunity to comment on the appropriations process for the VA fiscal year 2000 budget. VVA strongly believes that the Administration's budget request of \$44 billion for operation of the Department of Veterans Affairs (DVA) is woefully inadequate, especially the \$17.3 billion in actual appropriated dollars suggested for the Veterans Health Administration (VHA). VVA respectfully seeks your assistance in correcting a reckless budget request, that if passed, will inflict damage on an already troubled VHA.

VVA asks that you and your colleagues appropriate an additional \$3.2 billion to ensure that the VHA will deliver quality health care and provide other needed services to our nation's ill and disabled veterans. While reasonable people can and do disagree on exactly how much is necessary to keep the current system operating at a reasonable level, VVA believes that the bare minimum needed under any scenario is the \$1.7 billion recommended by your distinguished colleague, the Honorable Arlen Specter, Chairman of the Senate Committee on Veterans Affairs. Our analysis leads us to conclude that a more appropriate sum to maintain basic VA operations without further damage to organizational capacity to serve veterans properly is much closer to the \$3.2 billion recommended by the "Independent Budget of the Veterans Service Organizations" (IBVSO). In any case, VVA believes that we all agree that additional resources are needed.

The VHA is a large and complex health care system. It includes a number of "Specialized Services Programs" that are at the core of the VA's mission of "Caring for he/she who hath borne the battle". These programs include such areas as Seriously Mentally Ill, neuro-psychiatric wounds of war such as Post-Traumatic Stress Disorder (PTSD), treatment for the Blind and Visually Impaired, Spinal Cord Injury, and Prosthetics. Indeed, such a comprehensive and large system is hard to manage. Unfortunately, a truncated budget will serve to only exacerbate existing managerial problems-at the cost to the veteran-patient.

VVA believes that if adequate resources are made available, VHA can further develop its capability to do a much-improved job as long as the Congress continues close oversight on outcomes. Such improvements to reduce repeated preventable use of resources include, but are not limited to such actions as taking a full and complete military/medical history on every veteran who enters the system, testing for ALL conditions that may be relevant to the branch/time/place/MOS/actual experience of the individual's military service. Such a comprehensive work up will lead to a more proper and complete diagnosis and a more effective treatment plan that will actually lead to helping restore the Veteran to the highest state of "wellness" and the greatest degree of self-sufficiency possible. VVA believes that much of the "churning" of veterans back and forth through the system can be prevented. This is better for the veterans who becomes well, and for the VA in that precious resources are not spent in dealing with preventable visits.

VVA believes that the fiscal year 2000 budget request is a recipe for implosion within VHA. The VA medical structure is set up to allocate resources utilizing a prospective payment model. This prospective payment model, however, is within a closed system where there are too few resources. Increased competition for these resources has already started to block needed resources to the smaller, more specialized parts of the VHA system. We have observed this happening for the last few years, and it is most evident right now in fiscal year 1999.

It is now commonly known that VHA does not have the finances to maintain the current VHA system. Due to a significant shortfall in operating resources in the current year, VHA has asked for authority to proceed with cutbacks that include closing of facilities and a reduction of staff, to begin immediately. It is now public knowledge that VHA is seeking authority to implement planning to contend with additional reductions due to a shortfall of at least \$1.4 billion. This is coming from a system that was already preparing for reduction before the request. The announcement of an initial cut of 926 personnel at eleven sites is only the first wave of such reductions in capacity. It is VVA's understanding that at least another twenty-five sites have been approved for significant reductions.

The most troubling aspect of the budget request is that the VA is currently undertaking a series of "new" initiatives that will clearly involve additional cost. The VA has committed to move swiftly to test, treat, and compensate for the widespread problem of Hepatitis C among veterans, especially Vietnam veterans, which was

likely acquired as a result of military service. VVA believes that this is a vital and proper expenditure, desperately needed by affected veterans. Resources are necessary in order to pay for this treatment, however.

The VA is planning to commit an additional \$40 million toward assisting homeless veterans and to increase long-term care by at least \$105 million. While we certainly applaud these long-overdue steps, we are at a loss as to how the Office of Management and Budget (OMB) and the White House thought that the VA will be able to afford these vitally needed services without either providing additional funds or significantly diluting other existing, already underfunded services. VA's budget submittal simply does not "add up." Again, we respectfully request your committee to appropriate a VA budget that does "add up."

There is ever the need for a VHA system to serve as the primary means of delivering the highest possible quality of care to veterans. The fiscal year 2000 budget request is an affront to the veteran community, especially as millions of veterans are now of the age where health care is most needed. The normal problems of aging are often greatly exacerbated by injuries incurred in military service. Veterans health care is not just important to the veterans community, it is important to the future of this nation.

VVA is aware that an additional \$2 billion for the VHA will not be acquired through the ordinary process of creating a budget. We know that the money must come from somewhere else. Mr. Chairman, a \$20 billion budget for the VHA will be enough to simply preserve the organizational capacity of VHA to deliver its current state of medical care. If the Administration's budget request is approved, many veterans will find the chances of obtaining medical care even more scarce. Funding VHA at \$20 billion would still constitute less of a percentage increase than that which was provided to Medicare over the last decade, and significantly less than medical inflation. We strongly urge you to do the right thing and preserve the VA health care system at a time when more and more veterans are counting on it. The offsets can be found, given the creativity, experience, and intelligence of you and your distinguished colleagues.

It is no secret that the Veterans' Benefits Administration (VBA) is in dire need of reform. The recent "Report of the Congressional Commission on Service Members and Veterans Transition Assistance" strongly recommends a modernization of VBA's benefits delivery and infrastructure. The article in *The Washington Post* of April 10, 1999, regarding the deplorable conditions of the Washington, D.C., Regional Office is illustrative of the worst of the problems that veterans face in attempting to get timely, fair, and accurate adjudication of claims.

The disability claims process is beset with an adjudication system that is inconsistent in quality and accuracy, and extremely poor in timeliness. Currently, according to VA officials, there are over 390,000 claims pending and another 100,000 claims on appeal. According to VA Under Secretary for Benefits Joseph Thompson, VA data shows that errors in the claims-adjudication process occur at a 36 percent rate and that 42 percent of claimants are dissatisfied with compensation and pension services. Vietnam Veterans of America believes that one of the reasons the system is so clogged is that veterans have lost faith that they will get a fair and accurate adjudication the first time around, and they are all too often correct in this assumption. If VBA would "get it right the first time" then the incessant stream of appeals would begin to diminish. However, at this point, VVA believes that we just have too few people trying to accomplish too much work at the same time that they are trying to modernize the system by which claims are adjudicated. Simply put, VBA needs more funding in order to hire more people to get the job done.

While VVA believes that the Veterans Benefits Administration (VBA) needs more staff, we also believe that VBA is plagued with an adjudication and appeals process that lacks a focus. There are no precise, definitive rules that can be effectively and fairly applied to the processing of most cases. To compound this legal problem, the VBA has failed to properly update its information management system. While trying to implement a more efficient system, VETSNET, the effort resulted in a disparate system of information management that holds no one clearly accountable for project performance and operational system capability.

It is common criticism that VBA is not all that accessible to veterans with many regional offices in areas of small population and a telephone system that is cumbersome and buttressed with layers of electronic "shields." Other stations, as in the extreme case of the Washington, D.C., VA Regional Office have virtually ceased to function. In sum, the VBA is an organization that is not accessible enough to veterans and is run on less-than-efficient databases. VBA is in real need of an organizational overhaul. While it is not just money that is needed, proper resources are certainly part of the solution.

In order for the jaded claims adjudication and processing system to become truly efficient, new information-management systems and technology must be acquired. A redesigning of both human and physical resources must also take place. Veterans deserve the benefit system that they were promised—one that provides seamless access to an effective claims-processing system centered on an adjudication process that is fair and timely.

Mr. Chairman, if these changes do not take place, we will have a 21st century VBA that is even more inept than it currently is. VVA believes that prescience is in order here and asks that your committee act now and provide a VA budget that can afford to make the necessary changes in VBA before it manifests into an even larger and more expensive problem. VVA seeks a VBA that puts veterans first and also is not a drain on taxpayers' dollars.

Mr. Chairman, I would like to respectfully remind your committee and all of Congress that we now stand on the threshold of yet another ground war in Kosovo which has the potential to consume and harm many young American men and women. Already three U.S. service members are being held prisoner. Is under funding the VA, and most especially the health care system, the right signal to send to these soldiers? VVA thinks not, and asks that you ensure that there is a system in place to truly care for these future veterans.

Again, I thank you for considering our views on this most critical issue to veterans of every generation.

PREPARED STATEMENT OF THE AMERICAN GASTROENTEROLOGICAL ASSOCIATION

SUMMARY OF RECOMMENDATIONS

The American Gastroenterological Association ("AGA") urges Congress to increase funding for medical research on digestive diseases and disorders through budgetary increases to the Department of Veterans Affairs ("VA"). Specifically, the AGA encourages Congress to provide at least a 14 percent increase over fiscal year 1999 raising the funding for VA health research programs from \$316 million to \$360 million, as recommended by the Friends of VA Medical Care and Health Research ("FOVA").

MEDICAL RESEARCH RECOMMENDATIONS

The AGA appreciates the opportunity to present its views regarding fiscal year 2000 appropriations for the VA. The AGA is the nation's oldest, not-for-profit specialty medical society, consisting of over 10,000 gastroenterologic physicians and scientists who are involved in research, clinical practice, and education on disorders of the digestive system. As the nation's largest and leading voice of the gastrointestinal research community, the AGA is uniquely qualified to advise Congress on the current status of federally-supported digestive disease research programs and the areas in need of further research.

Digestive tract disorders cost more than \$115 billion annually. Gastrointestinal cancer, foodborne illness, gastroesophageal reflux disease ("GERD") and ulcers, motility disorders, inflammatory bowel disease, and hepatitis C account for the majority of digestive illnesses, impacting the lives of millions of Americans. They affect more than half of all Americans during their lifetime, ranking second among all causes of disability due to illness in the United States. Digestive disorders likewise strongly impact America's veteran population.

For some digestive diseases, medical research has brought us close to developing lifesaving treatments and cures. Yet, in others, we lack even a basic understanding of the cause and transmission of the disease. This testimony focuses on these serious health problems and makes recommendations on how Congress should allocate this country's precious medical research dollars.

GASTROINTESTINAL CANCERS

Approximately 226,300 new cases of gastrointestinal cancers will be diagnosed this year. Sadly, 131,000 Americans will die from these cancers. Certain veteran populations are especially at risk including those exposed to ionizing radiation, such as atomic test participants and Hiroshima/Nagasaki occupation forces. The most common cancers are described below.

—Colorectal Cancer is the second leading cause of cancer-related deaths in the United States. It is estimated that 129,400 new cases will be diagnosed this year with approximately 56,000 Americans projected to die from this disease in 1999. Colorectal cancer is linked to age with over 90 percent of people diagnosed

being over 50 years old. Further, African Americans have higher prevalence and mortality rates.

- Lower esophageal and upper stomach cancers have experienced a dramatic rise in incidence rates in the last 10 years.—In this year alone, nearly 22,000 Americans will be diagnosed with stomach or gastric cancer; 13,500 will die of it. A slightly lower number of people, 12,500, will be diagnosed with esophageal cancer this year. This cancer is more prevalent among African Americans.
- Pancreatic cancer will be diagnosed in 28,600 Americans in 1999 with the same number of people projected to die from this disease.
- Approximately 14,500 new cases of liver/intrahepatic bile duct cancer will be diagnosed this year in the United States and 13,600 deaths due to this cancer will occur. The incidence of liver cancer is increasingly dramatic due to the epidemic of chronic hepatitis C, notably more common among veterans.
- An estimated 3,600 people will die of cancer of the gallbladder and other biliary cancers this year with approximately 7,200 being diagnosed with this cancer.

The good news is that biomedical research, basic and clinical, has yielded increasingly positive cancer survival rates when patients' conditions are detected early. For example, 90 percent of people who develop colorectal cancer can be effectively treated if the disease is caught sufficiently early. Improved screening alone, however, is not sufficient. We need additional research to continue our understanding of this disease.

One of the greatest breakthroughs in gastrointestinal cancer research has been the discovery of a stepwise genetic progression in the development of gastrointestinal cancer. Researchers have identified a genetic link to gastrointestinal cancers in 20 percent to 30 percent of cases. Research shows that a genetic mutation at one generational level continues to mutate at succeeding generational levels, increasing a person's likelihood of developing cancer.

The VA has made cancer a medical research priority, but has not focused research on the following areas: (1) the genetic aspects of gastrointestinal cancer including the potential identification of other genes; (2) diagnostic tests for genetic abnormalities and prevention; (3) nutritional and environmental factors relating to the development of this disease, such as diet; and (4) the development and treatment of Barrett's syndrome (a common precursor to lower esophageal/upper stomach cancer) in patients with GERD. Research indicates that people with long-standing and severe heartburn symptoms are 43.5 times more likely to develop esophageal cancer. We urge the subcommittee to include language in the report accompanying the fiscal year 2000 VA-HUD Appropriations Bill which encourages the VA to intensify its research efforts on the genetic and nutritional/environmental causes of gastrointestinal cancers.

FOODBORNE ILLNESS

Foodborne illness is estimated to cost annually \$5 to \$6 billion dollars in medical costs and productivity losses. Some 6.5 to 33 million Americans suffer from foodborne illnesses each year, resulting in 9,000 deaths. Among the more common pathogens are Salmonella, Escherichia coli 0157:H7 (the pathological strain of the bacterium E.coli), Shigella, Campylobacter, Cyclospora, Listeria monocytogenes, and Cryptosporidium.

Not only does the VA population face the average risk of foodborne illness but also an increased risk due to potential bioterrorist attacks. As the goal of war turns from political concessions to mass injuries and casualties, one expects to see more bioterrorist attacks both against the military and the general population. Although people fear the more deadly anthrax and cholera viruses, some anticipate that actual attacks will involve foodborne and waterborne pathogens especially for terrorists trying to create mass panic and high morbidity costs with fewer deaths. This type of attack has already occurred in the United States in 1984 when a religious cult sprayed salad bars with Salmonella infecting over 750 people in an attempt to influence voter turnout and election results.

Current congressional efforts, which largely focus on inspection programs and on preventing the ingestion of contaminated food and water, would not protect against a deliberate bioterrorist attack. While these prevention-oriented initiatives certainly are important, treatments for those who do get sick once tainted food is consumed is essential. For some of these pathogens, we unfortunately lack even a basic understanding. As such, we encourage Congress to channel additional resources into research in the following areas: (1) the pathogenesis of the disease to identify the pathogens, to understand contamination and transmission patterns, to understand how pathogens translate into disease in humans, and to determine the reason for antibiotic resistance; (2) the reaction of the gut to infections. The research currently

being performed has focused on the kidney where few people are affected but the mortality rate is high. Stopping the disease when it is initially confined to the gut, however, would prevent the kidney from even being affected; (3) the development of animal models to understand how the pathogens cause disease and to develop treatment; and (4) the invention of vaccines or substances that bind with the toxins to prevent the illness.

The VA should join with the National Institutes of Health, the United States Department of Agriculture, the Food and Drug Administration, the Centers for Disease Control and Prevention, and the Department of Defense in implementing the Administration's Food Safety Initiative. The VA should emphasize research required to develop a greater understanding of the pathogenesis of foodborne illness and to discover effective treatments.

MOTILITY DISORDERS

Motility disorders affect five million Americans accounting for half of all gastroenterologic visits and ten percent of the visits to primary care physicians. Eight to seventeen percent of Americans suffer from functional gastrointestinal disorders, making it a major cause of morbidity and mortality from digestive illnesses, particularly among females. A higher prevalence of motility disorders was noted in Persian Gulf veterans, suggesting a potential link between the disorder and stress.

Research is needed due to the high prevalence of this disease and the lack of knowledge on how to identify, diagnose, and cure the disease. Irritable Bowel Syndrome ("IBS"), the most common motility disorder, is especially troubling because a patient does not present with any pathognomonic symptoms or laboratory findings of the disease, making diagnosis and treatment extremely difficult. IBS research is needed on: (1) understanding how the muscular and nervous system of the gut; (2) clinical descriptions and epidemiological studies of patients with IBS including family backgrounds; (3) genes that determine susceptibility and resistance; (4) brain interactions with the gut; and (5) virus foodborne infections that appear to initiate IBS in previously unaffected individuals.

A lack of a basic understanding of IBS has made drug manufacturers reluctant to fund research. If more federally funded research was focused on IBS, it would stimulate more private-public partnerships, and lead to advances in medical knowledge.

INFLAMMATORY BOWEL DISEASE (ULCERATIVE COLITIS AND CROHN'S DISEASE)

Inflammatory bowel disease affects two to six percent of Americans or 300,000 to 500,000 people. Unlike IBS, inflammatory bowel disease ("IBD") involves an inflammation of the bowel. One type of IBD is Crohn's disease, which primarily involves the colon and small bowel. The other is ulcerative colitis affecting the inner lining of the large intestine. IBD usually begins in early adulthood and persists throughout life with remissions. IBD affects people in the prime and most productive years of their lives and results in substantial morbidity and economic loss to them and society. People with IBD experience abdominal pain, fever, bowel sores, intestinal bleeding, anorexia, weight loss, fullness, diarrhea, constipation, and vomiting. In severe cases, the patient can hemorrhage or contract sepsis/toxemia resulting in death. The cause of IBD is unknown; it may be a virus or bacteria that alters the body's immune response causing an inflammatory reaction in the intestinal wall. Studies on the cause of IBD are desperately needed to better understand the disease and work towards more effective management and treatment.

HEPATITIS C

Viral hepatitis is caused by six different viruses (commonly labeled A, B, C, D, E, and G). Hepatitis C accounts for 60 percent to 70 percent of all chronic cases of hepatitis. Approximately four million Americans are chronically infected with the hepatitis C virus ("HCV") with an estimated 200,000 new cases diagnosed annually. HCV is more prevalent among veterans than non-veterans with rates estimated at between 10 percent to 20 percent of all inpatients in VA Medical Centers. This higher prevalence may be linked to transfusions which are more common among veterans, especially those who experienced combat. Further, minority populations have a higher prevalence of HCV. This disease is projected to cost \$600 million a year in terms of medical care and work loss, excluding transplantation costs. Between 8,000 to 10,000 people are expected to die from HCV this year with the death rate expected to triple over the next decade. It ranks second only to alcohol abuse as the cause of cirrhosis (i.e., liver cell damage and scarring) and liver disease, and is the leading cause for liver transplants in the United States. Further, 52 percent of all

VA liver transplant patients have HCV. Chronic alcoholism, a common concern among veterans, may increase the likelihood of developing chronic liver disease.

Acute hepatitis C results in a chronic infection in over 85 percent of the cases with most contracting chronic liver disease. This chronic infection is often asymptomatic, making detection extremely difficult. In fact, many people are not aware that they are infected, despite easy detection through a simple blood test. Twenty-five to thirty percent of HCV infected people develop symptoms ranging from mild to moderate problems of jaundice, fatigue, abdominal pain, loss of appetite, intermittent nausea, and vomiting to more severe, life-threatening conditions such as liver disease, cirrhosis, and end-stage liver disease, including cancer. In fact, the three main risk factors associated with developing liver cancer include HCV, the hepatitis B virus ("HBV"), and alcoholic cirrhosis with the increase in liver cancer being attributed to the rise in HCV and HBV.

Despite vigorous support by Congress and the VA, long-term remission can only be attained in up to 40 percent of HCV patients receiving anti-viral therapies. Further, no vaccines are currently available to prevent hepatitis C. Accordingly, more research is needed. The AGA urges Congress to support research in the following areas: (1) the molecular biology of HCV; (2) longitudinal study on the normal clinical course of hepatitis C and factors resulting in progression to cirrhosis and liver cancer; (3) epidemiological studies on hepatitis C and alcohol consumption; and (4) the interaction between HCV and other diseases such as diabetes and acquired immunodeficiency syndrome ("AIDS"). This research would enable the development of therapies to stop the progression of the disease, a vaccine to prevent transmission of HCV, and strategies for educating at-risk groups.

S. 71, introduced by Senator Olympia Snowe (R-ME), creates a presumption of service connection for the occurrence of hepatitis C for veterans who developed hepatitis C after experiencing the following while serving: (1) transfusion of blood/blood products before December 31, 1992; (2) blood exposure on or through skin/mucous membranes; (3) hemodialysis; (4) tattoo, body piercing or acupuncture; (5) unexplained liver disease or abnormal liver function tests; and (6) working in a health care occupation. S. 71 would raise the number of veterans eligible for treatment of hepatitis C at VA Medical Centers, making this research on a treatment even more pressing and cost-effective in the long term.

FUNDING RECOMMENDATION

The diseases, illnesses, disorders, and syndromes described above continue to take a huge toll on the American public and economy. The AGA appreciates Congress' commitment to biomedical research and to digestive diseases research in particular. However, more effort is needed. Many of the illnesses described above are only now beginning to emerge as the next epidemic. For others, like certain gastrointestinal cancers, research advances have placed the hope of eradication within our grasp. In either case, now is not the time to shortchange VA research programs. As such, we encourage Congress to ensure that the VA has adequate resources to appropriately pursue research opportunities in the areas discussed above by increasing funding 14 percent, from \$316 in fiscal year 1999 to \$360 in fiscal year 2000.

The AGA appreciates the opportunity to present its views on the fiscal year 2000 appropriations. Please call Michael Roberts, Vice President of Public and Government Relations at the AGA, at (301) 941-2618 if you have further questions.

PREPARED STATEMENT OF THE AIR FORCE SERGEANTS ASSOCIATION

Mr. Chairman and distinguished committee members, thank you for this opportunity to present what we believe should be among this committee's funding priorities for fiscal year 2000. As a nation, we ask our servicemembers to turn their mortal beings over to the dictates of their country. Their term of service is always arduous, and the job they do for all of us is fantastic. This committee among all segments of our national leadership holds the key to protecting and honoring our nation's warriors. You, in a very real sense, are the conscience of a nation in ensuring that our veterans are viewed as a vital national resource—not a financial burden.

As you work toward your appropriations decisions, the Air Force Sergeants Association and its 150,000 members urge you to ensure sufficient funding to provide for the integrity of the entire VA system. This funding and this nation's commitment to our veterans should ensure, with no delay, the full benefits, entitlements and medical treatment that those who have served have so rightfully earned.

AFSA members view all honorably discharged veterans as worthy of a full range of benefits that they earned through sacrifice and voluntary subjection to the unlimited liability clause: they formed a covenant with the nation to sacrifice their lives,

if necessary, to protect its interests. This nation's reciprocal response should be based on certain principles that this association urges you to use as a guide during your deliberations.

GUIDING PRINCIPLES

1. First, this nation owes its veterans dignified, transitional, recovery assistance . . . not based on rank or status, but simply because they served in the most lethal of professions.

2. Any decisions on care for the member must factor in a realization that most veterans are enlisted veterans. These veterans served with lower pay, generally re-entered the civilian populace with non-transferrable military skills, probably had relatively little civilian education, and served in skills that are less marketable.

3. This nation's commitment cannot waiver simply because of the large number of veterans. Congress and (in turn) the VA must never make determinations simply because "the money is just not there." It is more a situation of national will—not economic constraints.

4. Our enlisted guardsmen and reservists are full-time players. They are part of the total force. Any differences between reserve component members and the full-time force, in terms of VA programs or availability of services, need to be systematically erased.

5. It is important that the commitment of our troops to combat or high-risk situations also involves an absolute commitment to care for any malady that results.

GENERAL ISSUES

Many veterans are frustrated and disappointed because promises that were made during their careers are simply not being kept. They feel that the covenant between the nation and the veteran was one-sided, with honor on the side of the veteran. We urge this committee to support a written guarantee in writing of benefits to which veterans are legally entitled by virtue of their service.

We applaud the Veterans Administration for progress made toward the reduction in the time required to process claims and adjudicate appeals. We urge you to do all that you can to facilitate the VA's continued progress in this effort.

Despite military service draw downs and the resultant lack of the availability of "honor guard" personnel, it is incumbent that this government to ensure full military honors and burial rights for those who have served.

Because of the ravages of war, the unique nature of military service, and numerous other reasons, many veterans are homeless. These people, by and large, paid a tremendous price by serving their nation. We must expend an extra effort to assist our homeless veterans.

Over the last few years, there have been several efforts to make "Veterans' Preference" a reality. We urge this committee to support any improvement that will put "teeth" into such programs to help veterans transition back into the civilian workforce.

MEDICAL CARE

Without question, the health care system administered by the veterans administration impacts, in one way or another, those who served. Some issues that are reflected in the many phone calls we have received follow.

1. All honorably discharged veterans must have the full continuum of care—mandated by law.

2. VA-Medicare subvention is very promising, and we request full support for this effort. Under this plan, Medicare would reimburse the VA for care it provides to non-disabled Medicare-eligible veterans at VA medical facilities. This is an opportunity to ensure that those who served are not lumped in with all those who never chose to do so.

3. The enlisted force is pleased with the possibility of VA-DOD sharing arrangements involving network inclusion in the DOD health care program, and especially, the practice of consolidating physicals at the time of separation. These decisions represent a good, common sense approach that should eliminate problems of inconsistency, save time, and take care of our veterans in a more timely manner; AFSA supports these approaches so long as neither DOD or VA beneficiary access and care are jeopardized.

4. It is our contention that any limitation on the VA treatment of tobacco-related illnesses must be eliminated. Just as we care for those with other physical situations caused by their own lifestyle choices, it is absolutely wrong to draw the line here. I and many of you in this room can point out numerous situations from "care packages" with free 3-cigarette packs, to field duty and training punctuated by

“smoke ‘em if you gottem,” as indisputable facts that smoking was (until very recent times) a very real part of the military lifestyle. Full VA funding for tobacco-related illnesses needs to be reinstated.

5. While the VA's drive to save money by reducing its expenses is commendable, we caution the VA that these reductions must not be the overriding target. The only bottom line in this system should be the welfare of the veteran.

6. The VA must be fully funded to provide for long-term care including nursing home care; care for chronically mentally ill veterans; and home care aid, support and services.

7. The number of veterans who are women has significantly increased in recent years. The VA must be funded to provide the resources and legal authority to care for women to include obstetric services and after-birth care for the mother and child.

EDUCATION

Many members join our Armed Forces to get an education. Those who entered the service after December 31, 1976, and before July 1, 1985, were offered the Veterans Educational Assistance Program (VEAP). Within that program, the military member contributes up to \$2,700 which the government matches with up to \$5,400. VEAP pays \$300 a month for 27 months; however, there are approximately 55,000 members who came into the service between 1977 and 1985 who chose not to participate in VEAP because it was considered a relatively poor benefit in relation to the actual cost of classes. These G.I.s are now retiring (20-plus years of service) without any educational benefit.

Since 1985, the Montgomery G.I. Bill has been offered to new airmen entering the Air Force. If an airman chooses to participate, this program requires a \$1,200 payroll deduction, \$100 during each of the member's first 12 months of service. For that \$1,200, the member receives an educational benefit of \$528 per month for 36 months—clearly a much more valuable benefit than VEAP. However, the airman's enrollment decision must be made at basic military training; it is a one-time, irrevocable decision. At that critical juncture, many choose not to participate because they can't afford to do so due to their already-relatively-low pay. We ought to eliminate the current \$1,200 payroll reduction taken from each member who opts to enroll in the MGIB. During the pressure of basic training (and at a time of lowest pay) is not the appropriate time that airmen, many of whom have families to support, should have to make such an important decision. We should let them elect to enroll in the MGIB at any time during their first enlistment.

The 1997 VA Authorization Act created an open window for some VEAP participants to convert to the MGIB. However, 110,000 (DOD-wide) VEAP participants were excluded from converting to the MGIB because government counselors gave them faulty information. We have received dozens of phone calls and letters decrying the fact that these airmen followed the rules; but were excluded because the government decided to change the rules at the last minute. Under VEAP, there is a 2-for-1 matching. If you have money in your VEAP account, it is non-interest bearing. Accordingly, education counselors in all services advised VEAP participants not to put money into their VEAP accounts until they were ready to use the benefit. Unfortunately, when the 1997 VEAP-MGIB window opened, the law allowed only those with money currently in their accounts to convert to MGIB. Tens of thousands of VEAP participants were excluded from the conversion because they followed the guidance of government counselors. In basic fairness, we need to reopen that window one more time and allow all currently serving military members to convert to the MGIB.

Finally, while the MGIB is a good program relative to VEAP, it has not kept up with inflation. While the cost of undergraduate education has gone up 5 to 7 percent per year since 1985, the MGIB benefit has not kept pace. If the MGIB was at the same relative value as at its inception, the MGIB benefit would be approximately \$800 a month. I urge you to increase the value of the MGIB benefit and make it the same value (relative to inflation) it held when the program began.

Because many enlisted members have no choice but to go to work immediately after retirement, many never use their MGIB educational benefit. Those that are unable to use the benefit (many of whom have given the government \$1,200 to invest for a significant long-term return) don't receive a cent in return from the government. In fairness to them, and in recognition of their unique sacrifices and risks, participating members should be allowed to transfer their educational benefit to family members—we ask your support in that regard.

With all of the national attention on educational programs, it is important that we include military members in that dialogue.

HOME LOANS

The current VA home loan program primarily attracts only marginally qualified veterans. Fees, closing costs, and down payment requirements should be restructured to reduce the overall risk to the program. The best way to attract new veterans is to eliminate fees and make the program as attractive as possible.

For our reserve component members, the Selected Reserve Home Loan Program was authorized as a temporary initiative and was, last year, once again temporarily extended. Congress should permanently extend this program. The concept of "week-end warriors" is certainly an unfair, inaccurate misnomer. This nation owes our guardsmen and reservists great deal, the least of which is provision of a full benefits package for their service.

AFSA supports all programs that give veterans viable alternatives, especially in the area of housing assistance. However, if other home loan programs are made available, liberal qualification criteria and the "no down payment" feature should be maintained for all sources. Additionally, the reusability feature of the VA Home Loan program is very important to military members and veterans who are required to relocate several times during a career.

In conclusion, AFSA believes that the work your committee does is among the most important done on the Hill. Your job is not only to protect and reward those who served; it is to demonstrate to those currently serving and who someday will serve that this nation is committed to honor those who give a portion of their lives to their nation. Today, we have touched upon just a few of the important issues that you will wrestle with during the coming months.

In conclusion, Mr. Chairman, we thank you for this opportunity to present the views of the Air Force enlisted community. As you ponder and debate the proper focus of appropriations for future VA programs, AFSA asks you to determine to capture a fair portion of the reported \$1.6 trillion budget surplus for those who made that surplus and this nation's prosperity possible: America's veterans. On behalf of all AFSA members, we appreciate your effort and, as always, are ready to support you in matters of mutual concern.

DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT

PREPARED STATEMENT OF THE AMERICAN ASSOCIATION OF HOMES AND SERVICES FOR THE AGING

The American Association of Homes and Services for the Aging (AAHSA) is pleased to take this opportunity to present our comments regarding the fiscal year 2000 budget request for the U.S. Department of Housing and Urban Development (HUD) from the Clinton Administration. AAHSA is the nation's largest organization representing only nonprofit sponsors of senior housing. Our members own and manage over 300,000 units of market rate and federally assisted housing—including the largest number of nonprofit-sponsored HUD Section 202 elderly housing facilities.

As we stated in the past, as nonprofit sponsors of elderly housing we respond to entirely different motivations in developing housing for the poor, the needy, and the frail elderly. Our motivation is born of mission not profit. Ours is a mission of helping those whose needs are the greatest and of striving to provide housing and supportive services to all low-income elderly who need it.

Overview

As we begin the discussion of funding for elderly housing programs in the fiscal year 2000 HUD budget, we ask you to keep in mind the features that make elderly housing unique. Elderly housing provides a sense of physical and emotional security, which is particularly crucial for vulnerable older persons. It facilitates informal support among residents—generally an older woman living alone—and prevents a sense of isolation. It provides a cost effective means to link supportive services with housing for older persons, particularly critical in promoting independence and delaying more costly institutional care. Elderly housing has special design features unique to older persons, such as grab bars, pull-cords, lower cabinets, elevators, increased lighting, and non-skid surfaces. And, elderly housing incorporates programmatic features to encourage wellness, interaction with peers, and promotes community volunteerism. It provides and/or links community services, both formal and informal, through public and private institutions, neighbors, families and friends. As we stated in last year's testimony, housing for the elderly is more than a unit, it's home and it's a community.

Last year, AAHSA was particularly critical of an administration budget proposal that sought to fundamentally change the nature of the Section 202 elderly housing program. We believed—and appreciated this committee’s leadership to get Congress to agree—that last year’s Administration-proposed changes were ill-conceived, ill-planned, and ill-advised. Congress and elderly housing proponents believe strongly in the success of Section 202, and rather than dismantling this preeminent housing program for the elderly, were of the opinion that it could form the foundation around which other successful housing programs serving the elderly could be developed.

Last year, Congress roundly defeated each aspect of the Administration’s elderly housing budget proposal, and challenged HUD to go back to the drawing board and craft a workable model for elderly housing that focused on both the present and the future. During the past year, HUD and the Administration worked closely with elderly housing proponents in studying the state of elderly housing and sought to meet that challenge.

Fiscal Year 2000 HUD Budget Proposal

The fiscal year 2000 HUD budget proposal that eventually emerged from the Administration incorporated many of the ideas, approaches and objectives that AAHSA and other elderly housing proponents have advocated over the years. Central to the Administration’s elderly housing proposal is an historic multi-faceted housing initiative, a “Continuum of Care for the Elderly” program to “enable low-income and frail elderly to obtain decent housing and access the services that aging requires.” During the fiscal year 2000 budget briefing conducted by Secretary Cuomo and HUD’s various program Assistant Secretaries, AAHSA praised the department for taking innovative steps in this new direction to serve our nation’s senior population. Specifically, the continuum of care for the elderly builds on existing programs—particularly Section 202—and was showcased as a comprehensive “housing security” approach for the elderly. The Administration’s continuum of care includes: \$510 million for Section 202 new construction; \$50 million expansion of the service coordinator program; \$87 million for 15,000 rental assistance vouchers linked to low income housing tax credits for new construction; rental assistance vouchers linked to Medicaid for assisted living; \$100 million to renovate and retrofit existing elderly housing facilities for assisted living; use of the reverse mortgage program for rehabilitation and property improvement loans; and up to \$5 million of Section 202 funds for intergenerational learning centers.

The Administration proposal serves the purpose of opening a positive debate over how best to serve elderly housing needs as we enter the new millennium. While AAHSA has a few modifications for further refinements, we believe the Administration’s fiscal year 2000 budget proposal is a bold step positioning elderly housing as part of long term care. Because AAHSA has long been an advocate of a continuum of care approach utilizing elderly housing as part of the solution to long-term care for the elderly, our testimony will predominantly focus on that aspect of the Administration budget proposal. AAHSA’s commitment to, and vision for the continuum of care dates back to the founding of the organization in 1961 and the earlier “lifecare” practices of some of our members. As we look to the future, AAHSA encourages policymakers to see elderly housing as a key component of this “continuum for the millennium.”

Continuum of Care for the Elderly Proposal

Our comments below are designed to help the committee in its deliberation on specific parts of the Administration’s continuum of care for the elderly proposal:

Section 202.—As Section 202 celebrates its fortieth anniversary in 1999, it is recognized as the nation’s best and largest producer of affordable housing for very-low income seniors. Over the years, Section 202 has earned strong bipartisan support as the primary government program responding to the special housing needs of low-income elderly Americans. The program has coupled the cost benefits of project-based rental assistance with supportive services for frail elderly persons; has maintained a long record of sound management; and, its nonprofit sponsors have built a major portion of the nation’s supply of quality, affordable elderly housing while demonstrating long-term commitment to their communities.

Although the Administration asserts that it has maintained full funding of \$660 million for the Section 202 program in fiscal year 2000, in actuality, there are set-asides in the proposed budget that would reduce the funding level by \$150 million to \$510 million for development of 5,790 new units and rental assistance activities in fiscal year 2000. However, neither AAHSA nor the Administration should be forced to make a Solomon-like decision of choosing between supporting the continuum of care approach with its attendant parts, or supporting “full funding” for

Section 202 development. Both are needed, and neither should be shortchanged. In recent housing legislation, particularly in H.R. 202 and H.R. 1624, the Section 202 development program would be authorized at least at \$700 million in fiscal year 2000. And, H.R. 1624 would establish separate funding streams, including mixed-financing, for the other elderly housing continuum of care-type activities without “robbing Peter” or Section 202 to pay for those other activities.

Additionally, AAHSA has long advocated for flexibility in the Section 202 program to enable mixed-financed, mixed-income, and mixed-use facilities. AAHSA supports the flexibility in the program offered by H.R. 202, which allows use of funds for acquisition, modifies income limits in high vacancy areas, and allows Section 202 funds to be used in conjunction with other federal and non-federal financing sources. The “other sources of financing” feature would be particularly useful in coupling Section 202 with low income housing tax credits to develop and increase the production of new housing units.

While we strongly support much in the Administration’s continuum of care proposal, we encourage you to prevent reduction in funding for development activities under the Section 202 program and support \$710 million in fiscal year 2000 funding for Section 202 development and project rental assistance. We urge Congress to establish a continuum of care for the elderly account and provide an additional \$200 million for the Section 202 program to be available for mixed-financing and leveraging other development financing sources and enabling greater program flexibility. Program flexibility should include a change in statute to enable linkages between Section 202 and the low income housing tax credit program.

Service Coordinators.—AAHSA testified last year that the use of service coordinators in elderly housing facilities is an integral part of the continuum of care, and our facilities have come to reflect the vast support systems that enable the frail elderly to live independently with dignity and respect. Under the continuum of care concept, there are economies of scale benefits that accompany groups of older persons living together who have access to services to help make their life easier.

The Administration proposes \$50 million for an expanded service coordinator program to serve residents of HUD-assisted elderly housing and other eligible elderly persons living in a project’s neighborhood. Funding for the expanded program would be instituted as a set-aside under the Section 202 program. Over the years, AAHSA has advocated for a more reliable and stable source of funding for service coordinators, including funding service coordinators as a part of a facility’s routine operating expenses. Once again, we urge Congress to establish a more routine funding mechanism for service coordinators. We suggest that Congress provide new funding for service coordinators through the current competitive grant process, and subsequently allow grant recipients the option to build the cost of service coordinators into their operating budget upon the expiration of the grant. In addition, many elderly projects are constrained from providing a service coordinator because HUD’s 120 percent fair market rent cap prevents them from building the cost of a service coordinator into their budget. A waiver for nonprofit sponsors who specifically exceed the rent cap in order to fund service coordinators would resolve this problem. While we support the funding level proposed by the Administration—and it is consistent with the level of funds originally provided when the service coordinator program was first established—we oppose the notion that service coordinators should be funded out of Section 202 development funds as a set-aside in the Section 202 account. We urge Congress to establish a continuum of care for the elderly account in fiscal year 2000 and provide at least \$50 million in funding for (1) renewal of expiring service coordinator and congregate housing contracts, (2) new service coordinator contracts, and (3) expansion, to enable service coordinators to serve other residents residing in the community.

Assisted Living Vouchers.—AAHSA continues to favor the project-based approach over tenant-based vouchers as the preferable method of providing rental assistance to low income elderly persons for many of the reasons we outlined in last year’s testimony, including the most obvious reason that an older resident wants a place to age-in-place and prevent or delay placement in other institutional care settings. Vouchers make it more difficult for older persons, particularly more frail elderly and persons who need the service enriched environment of elderly housing, to find available and suitable housing in the community. And, vouchers do not expand the supply of affordable housing for the elderly. We continue to view vouchers as “eating our seeds,” we can live off our seeds for awhile, but it is short-sighted, and does not build or grow the future.

However, HUD proposes a change in law to allow existing Section 8 tenant-based vouchers currently used by low income elderly to cover the rent portion of assisted living costs. Given the fact that these vouchers are currently in use by elderly residents, AAHSA would support the expansion and use eligibility of these Section 8

vouchers. The purpose is to both prevent the transitioning of the elderly resident to more costly institutional care, and to provide greater options to elderly residents in their choice of residential and care settings. H.R. 1624 would also authorize an additional \$87 million for 15,000 incremental Section 8 vouchers to be utilized by low income elderly to help pay the rent cost of assisted living facilities on a 10 city/state demonstration basis. Priority would be given to very low income seniors who are Medicaid-eligible. The purpose of the demonstration is to gauge the effectiveness of Section 8 rental assistance in assisted living facilities, under controlled conditions, and report back to Congress with findings, particularly on the savings realized by serving Medicaid-eligible elderly persons in a non-nursing home environment.

These are objectives that AAHSA supports. We urge Congress to extend to low income elderly persons currently using Section 8 rental assistance vouchers the option to use their vouchers in assisted living facilities. We additionally support \$87 million in funding for 15,000 incremental vouchers to be used by frail elderly in assisted living facilities.

Assisted Living Conversion.—Just as our residents are aging-in-place, our housing is aging-in-place, and is in need of modernization and retrofit. For years, AAHSA has urged Congress and the Administration to establish a modernization and retrofit program to address the problem of aging buildings, especially since the loss of the Flexible Subsidy program and non-implementation of Project Retrofit under the Congregate Housing Services Program in the 1990 National Affordable Housing Act.

Under the continuum of care, the Administration proposes up to \$100 million of Section 202 development funds to be available for an innovative, competitive grant program to convert all or part of existing Section 202 projects to assisted living facilities through rehabilitation, modernization or retrofit. While AAHSA applauds the Administration for taking this particular half step forward, we believe that a full step is needed. This is a desirable objective, but we believe that increased flexibility would be more beneficial. H.R. 202 would allow savings generated from financial conversion of Section 202 facilities to be used for modernization and retrofit of facilities. H.R. 1624 establishes a \$100 million capital grant program for the rehabilitation, modernization, and repair of most project-based federally assisted elderly housing, and allows for conversion of elderly housing units to assisted living. We urge Congress to support a continuum of care for the elderly account in fiscal year 2000 that provides up to \$100 million in funding for the rehabilitation, modernization and retrofit of project-based federally assisted elderly housing, and up to \$100 million for conversion of elderly housing units to assisted living.

Intergenerational Learning Centers.—AAHSA has long promoted the concept of co-location, or locating services and service providers on or in close proximity to elderly housing facilities. HUD proposes to use up to five percent or \$5 million of assisted living conversion funds to provide space within elderly housing projects for Intergenerational Learning Centers where “the skills and experience of seniors will be harnessed to meet the need for affordable child care and allow seniors and children to learn new skills together.” While AAHSA supports this co-location approach, we would expand the eligible use of funds to other co-location activities, including adult day care, senior centers, home health care centers, and other types of services and service providers. We urge Congress to support a continuum of care for the elderly account in fiscal year 2000 that provides up to \$5 million in funds for co-location activities; and to provide language that encourages the use of funds from the CDBG account for co-location.

Other Issues

Financial Restructuring.—Last year, AAHSA outlined the arguments for the financial conversion of the existing debt-laden Section 202 inventory with Section 8 assistance to the capital advance program with project based rental assistance (PRAC), and urged this committee and Congress to consider changing existing budget rules to permit debt conversion while minimizing the budgetary impact. Since then, progress has been made in considering other ways of minimizing the up-front budgetary costs, including year-by-year debt abatement, prepayment and refinancing proposals. Once again, AAHSA urges the committee and Congress to allow for a range or menu of options in financial restructuring of the Section 202 inventory including debt conversion, prepayment and refinancing.

Program Funding.—AAHSA is additionally concerned with full funding for expiring Section 8 contracts; adequate funding at the Administration-requested level for the Section 811 and HOME programs; and prevention of resident displacement caused by owners opting out of the Section 8 program. We particularly urge Congress to proactively pursue ways to help stem the loss of affordable housing caused by owner prepayment and opting-out. Congress could help prevent resident displace-

ment by reducing the opt-out incentive by ensuring market returns to owners; by providing a right-of-first-refusal and other incentives to encourage the transfer or sale of opt-out properties to nonprofit organizations; by removing barriers to sales; and by facilitating acquisitions among sponsors with a long-term commitment to providing affordable housing. We also urge Congress to provide funding for "enhanced vouchers" to elderly residents in cases where expiring Section 8 contracts may cause rent levels to increase.

Conclusion

AAHSA is thankful for the leadership this committee has provided for elderly housing and for this opportunity to provide testimony. We are pleased to be able to contribute to the committee's deliberation on these critical issues, and we urge your support for the recommendations outlined in these comments. We hope that our comments will assist in helping you formulate a budget that is responsive to the increasing needs of very-low-income elderly. If you desire additional information, please contact Gerard Holder, Associate Director for Housing Policy at 202-508-9476 or gholder@aahsa.org.

LETTER FROM THE NATIONAL ASSOCIATION FOR EQUAL OPPORTUNITY IN HIGHER EDUCATION

SILVER SPRING, MD, *April 28, 1999.*

The Honorable CHRISTOPHER S. BOND,
Chairman, Subcommittee on VA-HUD-Independent Agencies, Committee on Appropriations, United States Senate, 274 Russell Senate Office Building, Washington, DC.

DEAR CHAIRMAN BOND: As President and Chief Executive Officer of the National Association for Equal Opportunity in Higher Education (NAFEO), I am writing to respectfully request your support and assistance with efforts to secure funding for minority programs in the fiscal year 2000 VA-HUD-Independent Agencies Appropriations bill. Specifically, on behalf of the 118 HBCUs represented by NAFEO, we ask that \$20 million be provided to support the HBCU-UP program.

NAFEO is the national umbrella organization representing the nation's 118 Historically Black Colleges and Universities (HBCUs). Of this number, over 100 of the NAFEO/HBCUs were founded prior to the Civil Rights Act of 1964 with the primary mission of educating African Americans. In fact, many of these schools were established during the Reconstruction Era as a means of educating persons who had been slaves. The other 14 institutions that belong to NAFEO, known as "NAFEO's Other Equal Opportunity Educational Institutions (EOEIs)" were established after 1964 and serve significant numbers of African Americans and other minorities.

Underrepresentation of minorities in science, engineering and mathematics (SEM) fields is a serious problem that threatens our nation's ability to effectively address the scientific and technological challenges of the next century. As the nation prepares for these challenges, it is essential that available resources be focused on improving the ability of young people from underrepresented groups to acquire the skills needed for meaningful employment in the high technology enterprise. Given the strong track record of HBCUs in producing a disproportionately large number of minority undergraduates with degrees in these fields, additional resources are needed to assist these initiatives.

Currently, the National Science Foundation (NSF) Directorate for Education and Human Resources (HER) provides \$6 million to three HBCUs (\$2 million per institution) with the expressed purpose of strengthening their SEM education and research infrastructure, including support for faculty, research experiences for undergraduates and scientific instrumentation. Another \$2 million is provided by the research and related activities account. While a 6 percent increase has been proposed for NSF generally, no increase is recommended for HBCU-UP, or the other minority programs administered by HER.

With respect to the fiscal year 2000 VA-HUD-Independent Agencies Appropriations bill, NAFEO is seeking increased funding for the NSF Education and Human Resources account. The request provides an additional \$12 million above the fiscal year 1999 level, and will support an additional six institutions. This would ensure that the current centers would continue to receive support at the fiscal year 1999 level of \$8 million while allowing for additional program participants.

A chart listing NAFEO's specific priority requests and the organization's general request is attached for your review. Thank you for your attention to this request. I look forward to meeting with you to discuss this and other initiatives in more de-

tail. The National Association for Equal Opportunity in Higher Education thanks you for all you do in "keeping the doors of opportunity open."TM

Sincerely,

HENRY PONDER,
CEO & President.

PREPARED STATEMENT OF THE COUNTY OF SUTTER, CALIFORNIA

Thank you, Mr. Chairman, and members of the committee for this opportunity to speak before you today on behalf of the County of Sutter, California in support of two project requests for fiscal year 2000. The County of Sutter appreciates this committee's support, and we look forward to working with the committee to continue to improve our economy.

Emergency Operations Center.—The County of Sutter, California requests a \$3.6 million earmark in the fiscal year 2000 VA-HUD Appropriations bill under Economic Development Initiative to construct a new Emergency Operations Center in Sutter County.

The County of Sutter has experienced four presidentially declared flood disasters in the last four years alone. In January 1997, Sutter County was part of the third largest evacuation in U.S. history when nearly 50 square miles were inundated. Given Sutter County location in the Sacramento River watershed, it is likely that additional emergency events will occur in the future.

The existing Emergency Operations Center (EOC) is wholly inadequate to meet the needs of the County and the region. It is located in a rural fire station pre-dating World War II that was actually dismantled and moved from San Francisco to its present location. It is small, noisy, poorly heated, and badly lit. Further, sanitary facilities are inadequate when the facility is in full operation. Perhaps most critical is the fact that modern communications devices—essential to emergency operations—do not operate in the existing EOC. And perhaps most ironically, the fire department must be relocated to a remote facility when the fire station is taken over for EOC purposes, thus placing the community at an even higher level of risk at the very time the risk level needs to be reduced.

The new facility will be located on high ground. The 10,000 square foot facility will include space for disaster operations, operational branch offices/meetings, media briefing facilities, restrooms, briefing areas, kitchen and dining areas, and off-shift rest facilities. Site improvements will include security gates, driveways, parking, a secure water source, an on-site wastewater disposal system, and security lighting.

The focus of the project is to upgrade the County's and region's disaster response capabilities by increasing usable area, centralizing vital communications and situation monitoring equipment, and adding modern support systems, such as networked computers and satellite communications.

The County is committed to constructing this facility and is willing to commit significant resources to capital facilities. However, federal assistance is needed if the County is to construct a facility capable of meeting the proven needs of the County and region. The assistance of this committee is greatly needed and appreciated.

Sutter County Industrial Development Projects.—Mr. Chairman, Sutter County also requests an earmark of \$300,000 in the fiscal year 2000 VA-HUD Appropriations bill under the Economic Development Initiative to provide critical assistance in the County's efforts to improve its economy by way of developing two industrial areas in Sutter County.

Sutter County, located north of the City of Sacramento, is an economically depressed rural region which relies heavily on agriculture for economic stimulus. Sutter County has relatively high unemployment rates and relatively low per capita income levels, and needs to diversify its economy in order to improve the lives of its citizens.

Two areas in Sutter County are well-positioned geographically to provide economic development opportunities in the form of an industrial/commercial reserve and an industrial park. The South Sutter County Industrial/Commercial Reserve provides an opportunity to develop approximately 3,500 acres of land near the Sacramento International Airport and major transportation corridors. The Sutter Industrial Park is located five miles west of Yuba City. While these two areas provide real economic development and diversification opportunities, the County lacks the financial resources to stimulate significant interest and development in these areas.

Mr. Chairman, the County of Sutter appreciates the committee's continuing assistance related to improving our region's economy. Thank you for the opportunity to appear before your committee. I would be happy to answer any questions.

PREPARED STATEMENT OF THE CITY OF GAINESVILLE, FLORIDA

Mr. Chairman and Members of the Subcommittee, my name is Pegeen Hanrahan and I am the City Commissioner of Gainesville, Florida. I would like to submit the following testimony for the record and ask for your assistance with regard to two important initiatives on which the City is currently working.

*Sweetwater Branch/Payne's Prairie Stormwater Protection Project**Background*

The Sweetwater Branch basin contains approximately 1,710 acres and is located in the southeast central portion of the City of Gainesville. The outfall from this basin discharges into Payne's Prairie, a state owned preserve and park system, which eventually flows into the Alachua Sink, a natural sinkhole that drains directly into the Floridan Aquifer. This Aquifer provides the majority of drinking water to Florida's residents.

The Sweetwater Branch drainage basin contains urban, commercial, industrial and residential area stormwater runoff. Because the branch runs through some of the oldest portions of Gainesville, most stormwater runoff is directly discharged into the Branch with very little flooding attenuation or pollution loading reduction. The runoff has the potential to affect threatened and endangered wildlife such as the Bald Eagle, the Woodstork, the Sandhill Crane, and the Southeastern American Kestrel. In addition, many domestic wells are used to obtain water from surficial and intermediate aquifers in the area.

Water monitoring sites along Sweetwater Branch indicate that inorganic constituents and nutrients are elevated. These compounds adversely impact water quality and, potentially, vegetation in Payne's Prairie and degrade water recharging the Floridan aquifer system through Alachua Sink. Specific conductance has been increasing over time, with averages ranging from 305 to 945 umhos/cm during 1997. The average total nitrogen concentrations range from 0.25 to 1.08 mg/L. Average total phosphorus concentrations are found to be 1.16 mg/L, with many values exceeding 3.00 mg/L. There is a presence of relatively high levels of total and fecal coliform, with total coliform bacteria found to exceed 1,600 MPN/100mL. Aquatic macroinvertebrate sampling and analyses performed in 1996 indicate an overall poor health of Sweetwater Branch. In summary, the situation has created concern amongst environmentalists, business leaders, and concerned citizens throughout the region that Paynes Prairie and the Floridan Aquifer are being compromised.

Project Description

The City of Gainesville intends to conduct surveying and engineering analysis to determine the most beneficial and appropriate means of providing treatment of the stormwater being transported through the Sweetwater Branch prior to discharge to Paynes Prairie. Conceptual studies have been conducted previously to identify optional locations for such treatment facilities. Based on these studies, a tentative location has been selected for further analysis.

Project Benefits

The primary goal for the proposed project is to provide a comprehensive ecosystem management solution to the problem of stormwater runoff from downtown entering Sweetwater Branch, Paynes Prairie and the Alachua Sink. The project will reduce or eliminate the sediment, debris, nutrients and general pollutants currently being discharged.

SUMMARY OF FUNDING NEEDS

Project Phase	Funding Need	Year
Engineering/Surveying	\$200,000	1st
Property Acquisition	800,000	2nd
Construction	1,000,000	3rd
Total	2,000,000	

It will be the City's intent to utilize \$500,000 appropriated last year for this project through USEPA to fund the engineering phase and assist in the property acquisition phase.

Stormwater Treatment

The City of Gainesville has been developing a multi-faceted approach to addressing stormwater runoff problems within the highly urbanized 1,700 acre Sweetwater Branch watershed.

At the upper most limit of the watershed, there is a Duck Pond Wetlands Restoration project under design. This section of Sweetwater flows through the Northeast Historic District. The Restoration project includes restoring a channelized section of the creek to a more natural flowing creek.

Sweetwater then flows through the Central City District adjacent and through the Matheson Historic Park. The City recently completed the installation of a Bafflebox treatment structure and has permitted the installation of another type of treatment structure called a Vortex Box. These structures efficiently remove sediments and floatables that are generally carried to and through the creek.

The City obtained a Brownfields designation for property located on the southern perimeter of the Central City District for purposes of designing a stormwater and groundwater wetlands treatment and flood attenuation facility that will be developed and integrated into a city park. In addition, the facility will serve as the master stormwater detention facility for the Downtown Redevelopment District.

This site is located adjacent to the Historic Train Depot that the City has recently acquired and plans to renovate. The park will provide interconnections to several major rail/trail facilities that connect Downtown Gainesville to the City of Hawthorne and the University of Florida campus. There is an intermodal transportation center under design as well to be located on property adjacent to the proposed stormwater park site.

The City's Electric Utility is in the process of designing a repowering plan for the historic Kelly Power Plant located adjacent to this site. There is consideration of utilizing the reuse water from a nearby wastewater treatment plant. This water is currently being discharged to the Sweetwater Branch downstream of the proposed stormwater park site.

The final proposed treatment facility is located towards the southern terminus of the creek as it enters into the State owned Paynes Prairie Preserve. This treatment facility will provide final treatment of the runoff prior to discharging into the preserve and ultimately into the Floridan Aquifer through the Alachua Sink.

The City of Gainesville intends to utilize the \$500,000 from USEPA to fund engineering phase and assist with property acquisition. Additional funding up to \$1.3 million is needed to provide total property acquisition and construction. The City of Gainesville is providing funding from the Stormwater Utility Program for portions of this overall master plan as well.

The Depot Avenue Project

The Depot Project includes the reconstruction of approximately two (2) miles of Depot Avenue from SR 331 to US 441 and the development of the Depot Wetlands Park. The Depot Avenue portion of the project is intended to address current safety and capacity issues and includes the construction of two travel lanes, turn lanes, curbs, sidewalks and landscaped medians. Depot Avenue traverses Gainesville from west to east, approximately one-half mile south of, and parallel to, SR 26 (University Avenue). Its western terminus is at the eastern edge of the campus of the University of Florida and its associated student housing development, and its eastern terminus is at SR 331 in Southeast Gainesville. It skirts the southern edge of downtown Gainesville at its mid-point, and its intersection with SR 329 (Main Street) is considered to be the southern "gateway" to Downtown.

Depot Avenue is located adjacent to the existing Depot Avenue Rail-Trail, which is an 8 foot wide asphalt bike trail. It alternately connects an existing recreational park and the proposed Depot Wetlands Park, residential areas, commercial areas, and industrial land uses along its length. The redesign of the road will address these varying conditions and will also provide for the involvement of the neighborhood residents it serves.

The enhancement of Depot Avenue will encourage increased utilization of mass transit, bicycle and pedestrian modes of travel and increase accessibility to a major public heritage and recreation destination for the community. The City of Gainesville's RTS Transportation Center is located on the north side of Depot Avenue directly south of the core of Downtown Gainesville. The Transportation Center is a multi-modal transportation hub for the Regional Transit System, Greyhound, Amtrak and the Bicycle Commuter Facility.

The enhancement of Depot Avenue will also provide infrastructure and improved safety while accessing from downtown and the University of Florida area to the Porters Community, just west of SR 329 (South Main Street) and Southeast Gainesville. The Porters Community lies within Census Tract 2, which extends north of

University Avenue, and Southeast Gainesville lies within Census Tract 7. Census Tract 2 is approximately 37.7 percent African American and Census Tract 7 is approximately 75.6 percent African American (Census, 1990). Approximately 35.1 percent of all families in Census Tract 2 are in poverty and approximately 31.6 percent of all families in Census Tract 7 are in poverty (Census, 1990). The socio-economic conditions of these areas include high crime rates, sub-standard housing, and lack of services and investment. The enhancement of Depot Avenue provides for safer access to the higher employment areas of Gainesville, including downtown and the University of Florida, improving physical infrastructure, including drainage improvements, lighting and streetscaping, and providing safe bicycle and pedestrian facilities that connect both east and west Gainesville to Downtown.

The Depot Avenue Project will provide for beautification, and encourage redevelopment and infill in the urban core of Gainesville and its adjacent areas. This enhancement will provide a region-based incentive for reducing sprawl development in the Gainesville Metropolitan Area by providing an alternative east-west corridor to SR 26 that allows for maximum use of alternative transportation. As a consequence, this project will increase mobility while minimizing pollution and congestion associated with the use of single occupant vehicles.

The Depot Wetlands Park is a proposed 22-acre Stormwater Wetlands Restoration Park that will serve as the stormwater management facility and developed urban recreational park that will serve many adjacent and nearby residential neighborhoods.

As part of the stormwater management component of the project, the facility is intended to provide water treatment for the Depot Avenue Project as well as the Central City District portion of the watershed that is located upstream of the facility. This project is in the planning stages as the centerpiece of a USEPA and Florida DEP funded Brownfields pilot project.

Once constructed the Park will serve as a hub for several existing and planned rail trail bikeways. The Depot Project provides linkages to the Depot Avenue Rail-Trail that links with the Waldo Road Rail-Trail, the proposed Downtown Connector Rail-Trail that links with the Gainesville Hawthorne Rail-Trail, and the proposed 6th Street Rail-Trail. This trail system provides connections between the Downtown area, the University of Florida campus, many residential neighborhoods, and other municipalities. The trail system serves not only recreational users but also serves as an alternative transportation facility.

The Depot Park is home to the Historic Train Depot Building that was recently purchased by the City of Gainesville for purposes of rehabilitation. The Old Gainesville Depot was built in 1907, and was placed on the National Register of Historic Places in 1996. The City of Gainesville was founded as a rail hub linking Fernandina Beach on the east coast of Florida to Cedar Key on the west coast in the mid-1800's and uses a train symbol as its official seal. The Old Gainesville Depot's under-roof, otherwise open loading docks will provide open vistas to the adjacent Stormwater Park. The Depot building will house a unique mix of destination-oriented cultural and commercial uses supportive of redevelopment in the Depot Area, the Depot Park, the rail-trail system, and the RTS Transportation Center. The historic Depot building's unique character and location will serve to make it both a lively destination hub for the neighborhood and a catalyst for further redevelopment of the area south of downtown. The building is a standing testament to and a significant visual emblem of Gainesville's rich history. It is also an historic symbol of transportation choice that is particularly appropriate to its envisioned new uses, the Stormwater Park, the adjoining rail-trail and its nearby connections that are being developed, and to the RTS Transportation Center that will be built across the street. The restoration of this building in conjunction with the restoration of the 22-acre Depot Park is expected to provide a major community destination and regional "eco-tourism" attraction for the community.

The City's Electric Utility is in the process of designing a repowering plan for the historic Kelly Power Plant located adjacent to the Transportation Center, Depot Historic Structure and the Stormwater Wetlands Restoration Park. The planning firm of Dover, Kohl and Partners has recently completed a community-planning process held in conjunction with the repowering project. This community-planning process included the entire Depot Avenue area adjacent to Downtown. The City encourages citizen participation in the community-planning process and actively provides opportunities for participation in the planning of public infrastructure such as the Depot Avenue Project.

The Depot Avenue Project will include property and right-of-way acquisition, design and construction activities at a cost of approximately \$18.8 million. The Depot Wetlands Park includes property acquisition, design, remediation and construction activities at a cost of approximately \$10.0 million.

PREPARED STATEMENT OF CITY OF DAYTON, OHIO

Chairman Bond, Ranking Member Mikulski, and Members of the Subcommittee, thank you for the opportunity to submit the following testimony which briefly details a concept that we call "Tool Town" for which we are seeking your partnership and support in the amount of \$2 million.

Tool Town is an idea that was created by a tooling community and machining task force during the development of the comprehensive plan for the city of Dayton. Tool Town will be a precision metalworking park for the tooling and machining industry located on underutilized industrial property in downtown Dayton. Tool Town will concentrate tooling and machining companies, support services, and educational opportunities in a unique campus-like environment. It will provide the opportunity for companies to share equipment, staff, and resources and to cooperate in new ways to meet a variety of customer needs. This unique approach will not only support the region, but also help the tooling and machining industry compete globally and retain these high-paying jobs in the United States.

In the short term, Tool Town would provide a home for 23 businesses employing over 1,500 people, and through its growth over the next 20 years, would house over 80 tooling and machining businesses and still have the capacity for additional growth. Just within the city of Dayton, this industry would be the direct supplier of 5,600 new jobs and the generator of an equal number of new, spin-off jobs.

Ensuring the success of the tooling and machining industry will help accomplish goals established in our comprehensive plan, including increased per capita income, poverty reduction, revenue generation, and job creation. These goals are relevant to the entire region, especially in areas that formerly were centers of manufacturing and distribution and whose citizens have suffered the most from the loss of those industries and the impacts of urban sprawl. The creation of Tool Town will support the long-term viability of the tooling and machining industry and provide jobs for people who need them.

Tooling and machining businesses can provide secure, well-paying jobs with benefits and the potential for advancement. The jobs are available to a high school graduate after a nine-month training program at Sinclair Community College, located in downtown Dayton. Sinclair has a tooling and machining certification program that is recognized as the best in the United States.

The average graduate has a minimum of three job offers and all graduates get jobs. They are also designing a new curriculum to provide advanced training which will produce "top gun" machinists.

The development of the Tool Town campus will also demonstrate the feasibility of reusing brownfields. We have already received an U.S. EPA Brownfield Pilot Program grant to complete an environmental assessment and develop a reuse strategy for this site. A successful brownfield project in our region will stimulate similar activities on other underutilized and abandoned industrial sites. Its location in the urban core permits economic development without additional major investments in public infrastructure by reusing the existing roadways and utilities that are already adequate to support full development of this site.

REGIONAL STRENGTHS

The Miami Valley region has tremendous strengths in tooling and machining. We are the fourth largest concentration of tooling and machining industries in the United States. A recent survey of 11 counties in this region¹ indicates that there are currently over 825 tooling and machining companies employing approximately 26,000 people. This represents a \$1 billion yearly payroll and \$2.2 billion annual sales revenue.

The industry is growing in our region. In the last five years, the number of jobs in tooling and machining has increased by 22.7 percent. This is compared to a total employment growth rate of 5.3 percent in the Dayton-Springfield area and 7.1 percent in the state of Ohio.

We have a wide breadth of capabilities in the industry, including precision machining; molds; and special machines, processes, and services. We have the ability to meet a variety of customer needs through cooperating among area firms.

Educational opportunities are also a regional strength. As mentioned above, Sinclair Community College is located near Tool Town and is currently providing train-

¹Survey completed by the Center for Business and Economic Research, the University of Dayton. Survey area includes Butler (northern portion), Champaign, Clark, Clinton, (northern portion), Darke, Greene, Miami, Montgomery, Preble, Shelby, and Warren (northern portion) counties.

ing for this industry. They are also working with Dayton Public Schools on a possible joint venture to be located at the Tool Town campus.

PARTNERS

There is a network of partners already involved in and committed to this project. Partners at the local level include public and private organizations such as the Dayton Tooling and Machining Association, whose members have contributed \$250,000 to provide two years operating capital for the Tool Town Foundation; Montgomery County; Sinclair Community College; the Brownfield Redevelopment Authority; and the Miami Valley Economic Development Coalition. Local funding contributions toward tooling and machining initiatives represent over \$1.7 million, including the construction of the Dayton/Miami Valley Entrepreneurs Center, an Edison technology incubator to be located in tool Town. Local in-kind contributions represent \$835,000 worth of staff time dedicated over the next three years to implement these initiatives.

At the state level, the Ohio Department of Development has pledged operating funds for the Entrepreneurs Center of up to \$200,000 a year and the Ohio Department of Transportation is supporting our application for a Transportation and Community and System Preservation Pilot Program (TCSP) planning grant for the Tool Town campus.

As previously mentioned, the federal government is also partnering on this project, including awarding Dayton a U.S. EPA Brownfield Pilot Program grant and the U.S. Economic Development Administration contributing \$1.1 million toward the Entrepreneurs Center. We were also selected to participate in the final round of the TCSP grant program and hope to receive a \$300,000 planning grant for the Tool Town campus. In addition, the city of Dayton has allocated \$670,000 of our HUD funds toward acquisition of a former foundry that comprises 11 acres of Tool Town.

CONCLUSION

The tooling and machining industry is globally significant. It has a bright future. It is the core technology of every kind of manufacturing and is essential to research and development, not to mention our country's infrastructure, space program, and defense readiness. It is essential, that as a nation, we maintain our ability to engineer, build, and maintain tools.

While the global market presents opportunities there are those who are working hard to take this lucrative business away from the United States. The Pacific Rim countries already have 40 percent of the world market in this industry, equivalent to the United State's share, and their stated plan is to acquire 80 percent of it. Tool Town will be a national demonstration project of a new way for businesses to work together to meet this challenge. It will help ensure that the United States will increase its share of this industry in the new century.

PREPARED STATEMENT OF THE HABITAT FOR HUMANITY INTERNATIONAL

Mr. Chairman, Ms. Ranking Member, Distinguished Members of the Committee, colleagues, and guests: It is a privilege to testify on behalf of legislation which advances the opportunity for low-income people to achieve the American Dream of homeownership. Habitat for Humanity has two basic goals: To build houses with—not for—persons who in no other way could own their homes; and to make it a matter of conscience that everyone deserves a simple, decent place to live. The SHOP and Capacity Building programs support and advance both of these goals in important ways.

Before I illustrate just how much of an impact these programs make, allow me to describe Habitat for Humanity International and its role in the process. Habitat for Humanity is an ecumenical Christian organization; for 23 years, we've been building houses with people in need throughout the United States and much of the rest of the world. Last fall, Habitat dedicated its 70,000th house. In little more than a year, we expect to complete our 100,000th house. The families who move into these houses make monthly payments on no-profit, no-interest mortgages; they also contribute as much as 500 hours of "sweat equity." Habitat for Humanity offers these families—chosen without regard to race, religion, sex, or national origin—a "hand up," not a handout. Habitat's nearly 1,500 affiliates in the United States select homeowners on the basis of need, their ability to pay the no-interest mortgage and their willingness to partner with us (invest sweat equity). Each of these affiliates carries 501(c)(3) non-profit status and is directed by its own locally elected vol-

unteer board of directors. Only about one of every four affiliates has any paid staff; the rest are operated entirely by volunteers.

Habitat uses two federal programs to help "set the stage" for its homebuilding: the Self-Help Housing Opportunity program (SHOP) and Capacity Building. These programs make grants to Habitat for Humanity International, which, in turn, makes grants to its affiliates in all parts of the country. Habitat is strictly accountable to the Congress for use of program funds. We make regular reports to the Secretary of HUD.

The Congress last year re-authorized SHOP and Capacity Building for fiscal year 1999 and fiscal year 2000; now the programs await appropriations for which national and regional non-profit groups will compete. SHOP and Capacity Building merit appropriation of funds, because they work. At Habitat, for example, we're on track to build more than 4,000 houses with the SHOP 1996 and SHOP 1998 awards we've received—in fact, when the building is done, we'll have built about 400 more homes with the assistance of the two SHOP grants than our agreement with HUD calls for. SHOP funds are used only for land and infrastructure. Organizations awarded funds must average one house built for every \$10,000 included in the two-year grants (we're averaging \$9,071 for each SHOP 1996 house and \$8,086 for each SHOP 1998 house). At Habitat, our affiliates are responsible for raising the rest of the funds to build each house, which, on average, costs at total of \$43,251.

In the three years since the inception of SHOP, Habitat for Humanity and Housing Assistance Council have been the primary users of the funds. SHOP has made a significant impact on housebuilding among Habitat's affiliates in the U.S.; affiliates participating in the program built 60 percent more units in 1998 than they did in 1996. Every day, we see SHOP do exactly what it's meant to do—give Americans in need the chance to move into their own homes and slip the bonds of poverty. We respectively request that \$20 million be appropriated for SHOP for fiscal year 2000.

The Capacity Building program allows Habitat for Humanity International to fund affiliates' initiatives to increase the number of houses they build. Affiliates are required to show us how Capacity Building funding can help them increase homebuilding volume by at least a 15 percent increase. With Capacity Building funds from the Supplemental 1997 budget, 62 Habitat affiliates plan to increase homebuilding volume by 169 percent in the next three years!

Capacity Building funds are used in two ways. Approximately one-third of the funds helps provide technical assistance to affiliates through the support of affiliate managers (each affiliate manager advises 30 affiliates). Affiliate managers provide a variety of training to local volunteers, resulting in increased production of Habitat homes. Approximately two-thirds of Capacity Building funds are made available to local Habitat affiliates to provide equipment and persons to develop capacity to increase house numbers. Since no more than one-fourth of Habitat affiliates have any staff and since Habitat's experience is that even one staff person raises the numbers of houses almost exponentially, affiliates may apply for funds for staff positions on a three-year diminishing basis (100 percent funding the first year, 75 percent the second year, 50 percent the third year). This method motivates affiliates to take full responsibility for staffing by the fourth year. Many more affiliates seek these funds than can be accommodated. It is important to note that each affiliate must first raise \$3 for each \$1 in Capacity Building funds it receives. We respectively seek \$10 million to be appropriated in fiscal year 2000 for Capacity Building.

SHOP and Capacity Building are not about statistics or processes; they're about building hope for Americans who have so little. I could not describe these programs adequately if I didn't offer at least a few examples of the lives they have touched.

Minnie Burgess, a new Habitat homeowner in Miami, Fla., only dreamed of homeownership before she heard of S.H.O.P. and Habitat. She spent much of her time keeping eight grandchildren from the drug dealers milling about her former apartment complex. Today, thanks to Habitat and S.H.O.P. funds, she and her family live in a safe neighborhood.

"I can't even explain what Habitat has done for me and my grandkids," Burgess said. "We're all prouder now and have room to get around a little more."

Carol Seumptewa, a Habitat homeowner in Arizona, couldn't afford a decent house for her 21-year-old quadriplegic daughter and herself on her receptionist's salary. But because of S.H.O.P., they will soon move into a brand new handicapped-accessible home equipped with a roll-in shower, lower sinks and handrails.

SHOP also helps improve lives by fighting crime. A Habitat-developed subdivision in Lynchburg, Va., deters wrongdoing through design features incorporated in its street layout, landscaping and lighting. The 88-home development—Jubilee Heights—can be traced to S.H.O.P. money that "set the stage" for housebuilding.

Capacity Building is also building a repertoire of success stories at Habitat. One of the best examples is that of four affiliates in the Mississippi Delta area of north-

west Mississippi that are putting Capacity Building funds to work to hire a resource developer who will target other sources of funding. The new fund-raising impetus is expected to result in about 20 houses in less than three years. It's just one instance of how Capacity Building provides the seed money for even more resources that accelerate housebuilding.

There is a story behind every new house. SHOP and Capacity Building are changing lives one family at a time and thousands with each grant. Let's keep the momentum going. Appropriations of the SHOP fiscal year 2000 and Capacity Building fiscal year 2000 programs will see to it that more Americans build better futures.

PREPARED STATEMENT OF ST. JOSEPH'S HOSPITAL HEALTH CENTER

Mr. Chairman, thank you for the opportunity to submit this testimony and for the support that this Subcommittee gave to St. Joseph's Hospital Health Center last year. St. Joseph's, located in downtown Syracuse, New York, is a non-profit 431-bed hospital and health care network providing services to Onondaga County and to patients from 15 surrounding counties. St. Joseph's is best known for its ranking as the #1 hospital in New York State for open-heart surgery in terms of lowest overall mortality rate. We are very proud of this ranking, which we have held for three consecutive years. What many people do not know is that we are also the largest hemodialysis center outside metropolitan New York. My statement is focused on these two areas of expertise at St. Joseph's and how we plan to initiate a chronic disease management model that will benefit our current patients with heart and kidney disease and enhance the quality of life for at-risk patients in the region. We see this initiative as one with not only health enhancement benefits but also with significant positive economic implications for the community and the region.

St. Joseph's provides over \$7 million in bad debt and charity care to our service region. This comes to about 4 percent of our operating budget. This number has steadily risen over the years and we feel it will continue to do so unless some dramatic steps are taken. In order to increase access to patients who are underserved and at-risk for disease, we have implemented a program of "patient-centered care." We believe we achieved our #1 ranking for cardiac care through this process, which employs a secondary prevention model for disease management. By applying a multidisciplinary team approach to heart disease and preparing patients before surgery and rehabilitating them after, we have reduced mortality rates as well as the number of second hospitalizations. We have done this to improve the overall health of an underserved and underinsured patient base, but also for practical financial reasons. While our rehabilitation and education programs for our cardiac patients are largely unreimbursed, we are rewarded by having to perform less expensive charity care on patients who would typically end up back in the hospital without disease management.

Recognizing that early assessment is important to reducing the number of expensive treatments required later in life, St. Joseph's instituted a Wellness Place at a local mall so that people could stop in at their convenience. The Wellness Place provides free, general health screenings such as blood pressure readings, cardiac and diabetes risk assessment, counseling and patient education and seminars. Last year, approximately 15,000 people used the Wellness Place. Nearly 1000 of these people were determined to be at risk for heart disease, diabetes, or vascular problems. These individuals were offered follow-up services intended to change lifestyle, such as nutritional counseling, smoking cessation, exercise programs and other similar regimens. They were also offered a choice of primary care physician if none was identified. This is all done at considerable unreimbursed expense to St. Joseph's but with the knowledge that a great deal of money will be saved in the long run—for the patient, the Medicare system and the hospital. The most dramatic economic implications I mentioned are encompassed within this concept—but not all. At risk patients are working people who may lose jobs if their disease progresses. It is important to realize, however, that patients with diagnosed diseases or who have congestive heart failure, may still work and lead productive lives if an effective disease management program is initiated at the earliest stage possible. The other economic benefits come in the form of the support required for this program. I will detail those later in this statement.

Assessment is the first line of defense in chronic disease management; but, there are many other factors involved after this step is taken. A program for management of disease must adequately educate patients and then foster a sense of individual responsibility for the importance of following prescribed regimens. This takes a great deal of initial monitoring and time spent with patients by telephone, at community health centers, and in the home. This also requires coordinated community

participation by physicians, nurses, pharmacists, physical therapists, educators, behavioral specialists and even employers.

Diabetes, leading to kidney disease and kidney failure, is the most expensive disease in the country. The second most expensive, and #1 admitting diagnosis for Medicare, is congestive heart failure. The U.S. spends more than \$7 billion annually in Medicare dollars for these diseases. The clinical relationship between chronic kidney failure and heart disease (e.g., high blood pressure) requires similar early intervention techniques as well as later management, treatment, and rehabilitation. Utilizing resources already developed and in place for our cardiac rehabilitation program, St. Joseph's is proposing to further develop a chronic disease management program focused on hemodialysis. Combining resources in this way will be cost effective and has the potential to radically change the management of kidney disease.

The specific objectives of the program will begin with early identification. Timely referrals to a nephrologist can be improved so that more aggressive treatment can be initiated to prolong kidney function and allow better preparation of the patient for dialysis. Second, we will identify, investigate, evaluate, and implement technology that will promote in-center self care and home hemodialysis modalities. The Aksys Corporation has developed a product that has the potential of achieving this objective. Third, we will utilize the St. Joseph's Cardiac Rehabilitation Model for the renal patient. This model will emphasize education and exercise with the goal of improving the percentage of patients that stay employed, reduce frequency and length of hospitalizations, and improve patient acceptance of and control over disease processes. Finally, we will apply our disease management techniques to our overall goal of reducing the percentage of candidates for kidney transplantation. The ultimate goal of the renal patient and the health care industry is to have renal patients lead a "normal" life. Currently, kidney transplantation is the modality that is most associated with that goal.

Our history of service and specialization in the areas of cardiac and kidney disease has proven that there is a demonstrable need for a chronic disease demonstration in these areas for the Central New York region. The demonstration will involve relationships and initiatives in Dialysis, Cardiac Care, Home Care, and Wellness. What we lack at this point, is a facility that can be shared by both cardiac and dialysis patients. Our current dialysis facility, the largest outside the New York Metropolitan area, is woefully inadequate in every way. The facility was originally built as a modular, temporary, unit over 20 years ago. We now treat our overload of patients in the hallways and have legitimate safety concerns that come with overcrowding and questions as to the future structural integrity of the plant itself. We have not replaced this facility for financial reasons but, fortunately, have been able to treat patients satisfactorily. We have three satellite clinics in the region that are also operating at capacity. Our goal is to implement our demonstration program in an on-campus facility that will provide the space needed for dialysis, exercise facilities, classrooms, meeting rooms, examination rooms, and nurse and allied professional training space. Training of personnel is an important aspect of implementing an innovative chronic disease model.

In terms of economic development for the region, we believe that keeping our patients healthy and productive will have the most dramatic impact on the economy albeit in the long term. For the shorter term, we believe the training programs that we currently provide and will expand in areas such as home care, nursing, rehabilitation specialists, and counseling, to name a few, will bring employment opportunities to people in and around Syracuse. As we expand our efforts, we will likely train people outside the immediate area to be able to serve the outlying areas where our satellite clinics are and in homes in more remote locations. The facility we envision will also provide many construction jobs over the next couple of years. The two-story facility, equipment and program operation will cost approximately \$12.5 million. St. Joseph's has requested Federal partnership grant funding of \$5.1 million that will also cover start-up operating costs. We estimate, based on our current services, that our operating budget will exceed \$5.5 million per year.

As you know, St. Joseph's received \$750,000 last year to begin the planning and site preparation necessary for the new Center. We are very grateful for this support and urge you to complete this investment with an additional \$2 million in fiscal year 2000 toward our total requested federal share for the initiative. Having made this request, which we realize is considerable, we would like to assure the Subcommittee that St. Joseph's will provide, through private sources, the remainder of the estimated total for this effort or \$7.4 million.

We recognize the magnitude of this request but believe wholeheartedly that this facility, and the implementation of our chronic disease management model will repay this initial investment many times over in terms of Medicare savings and in terms of providing a national model for replication across the country.

Thank you.

PREPARED STATEMENT OF THE VILLAGE OF FREEPORT, LONG ISLAND

Chairman Bond and members of the Subcommittee, I am Mayor William F. Glacken of the Village of Freeport, Long Island.

I appreciate your receiving this testimony from me about the revitalization of the Freeport Nautical Mile, a critical project affecting our Village and Region. Representative Peter King is fully aware of the importance of this project to our community, and has written to you in support of our project.

The Village of Freeport is the largest Village on Long Island's South Shore. It is located approximately 25 miles east of Manhattan. We have a population of approximately 50,000, making us the second largest Village in the State of New York.

Freeport is one of Long Island's historic commercial, residential and recreational centers, with a history of settlement stretching back over 300 years. We have welcomed successive waves of immigrants throughout our history. Large percentage increases in our population occurred at the turn of the century, in the 1920's, and particularly in the rush to the suburbs which followed World War II. Our identity as a multiracial, ethnically diverse community goes back for decades. I am particularly proud that in our community black, white and hispanic residents are almost equally represented in our total population. These residents are also equally committed to building their futures in our Village. I know they represent a tremendous asset in making Freeport a model for 21st century growth and cooperation.

As an older suburb, we share many of the problems and challenges that face urban areas and small cities. Our central business district has been "hollowed out" by competition from regional shopping malls. We have a high property tax burden in relation to other areas of the County and region, due in large part to a growing school system with a higher than average population of children at risk and new immigrants with limited English language capability.

When I came into office two years ago, the Village faced a looming deficit and a true financial crisis. In addition, Freeport had not made necessary infrastructure improvements needed in our waterfront and central commercial areas to retain small businesses and attract visitors. With hard work and tough decisions, we have stabilized that situation, but this is the situation and the context in which we face the project I want to talk about with you today: the Revitalization of one of the Freeport's priceless assets, our working waterfront, "The Nautical Mile."

Freeport is one of New York State's Historic Maritime Centers, the largest one within Long Island's South Shore Estuary. It is the only large, diverse working waterfront in Nassau County, home to commercial fishing vessels, fish markets, boat sales, seafood restaurants, charter boats and marine-related businesses and shops. Although it has been a vital engine of economic and recreational activity for more than a century, a number of factors including the economic downturn of the early 90's, changes in the region's commercial fishing industry, the closing of several marinas which had been long time anchors on Woodcleft Avenue, and a deteriorating infrastructure caused by recurrent flooding and postponed rehabilitation contributed to decline along The Nautical Mile.

We needed to act to save the Nautical Mile from irreversible decline. We have acted. We have begun to implement one of the most ambitious revitalization projects now underway in Nassau County. In the coming months, the entire one mile length of Woodcleft Avenue will be raised by as much as 2 feet as necessary to finally end the recurrent flooding that has hit our businesses so hard. Magnificent water views and public access to the water along boardwalks and bike paths will be opened, as the Village develops the Little Swift Creek Recreational Facility at the water gateway to Woodcleft Canal. A new 11 foot wide brick-paved Promenade will replace existing narrow walkways. Utility lines will be relocated underground and decorative lighting installed to further enhance the Nautical Mile. A new pier and Esplanade will be built at the center of the Nautical Mile on the grounds of the Long Island Maritime Education Center, a unique museum and educational facility also known as "The Seaport at Freeport" and the only satellite program managed by the South Street Seaport Museum.

We are also working to consolidate some of our wholesale and retail fish marketing to a "mini-Fulton Fish Market" to help retain and strengthen the Nautical Mile's remaining commercial fishing ventures. And finally, working with Nassau County we hope to reconstruct the road which Freeport named for one of its celebrity citizens, Guy Lombardo Avenue, to provide a thematically designed link between the Nautical Mile and our currently economically distressed central business district.

This ambitious project has stretched our resources to the maximum. Protecting and revitalizing Freeport's waterfront has been recognized as a regionally significant project, and we have received critical support through competitive proposals that have won support from FEMA, federal ISTEA funds, Empire State Development and other State agencies, and from private industry. I am requesting \$4.2 million today from your Committee to provide vitally needed assistance that will ensure the momentum we need to make the Nautical Mile Program a success. I thank you on behalf of all of Freeport's citizens for your consideration and help in working with us to build Freeport's future on high ground.

PREPARED STATEMENT OF THE UNIVERSITY OF THE SCIENCES IN PHILADELPHIA

Mr. Chairman and Members of the Subcommittee, thank you for the opportunity to submit this testimony to your hearing record. As President of the University of the Sciences in Philadelphia (USIP), I make an appeal on behalf of both campus and community. The University of the Sciences in Philadelphia, formerly known as the Philadelphia College of Pharmacy and Science, has been a member of the Philadelphia community since 1821. USIP is the oldest institution of higher education in the field of pharmacy in the country and holds the very special distinction of having most past and current pharmaceutical founders and/or CEOs in the country as alumni. The specific purpose of my statement is to make a case for federal assistance to develop a highly visible, 11.2-acre tract of land donated to the University by the Unilever Corporation, parent company to Breyer's Ice Cream. This piece of land is adjacent to the University and actually doubles the size of our city campus and provides USIP an unprecedented opportunity to significantly change the face of our West Philadelphia community.

The University of the Sciences in Philadelphia has developed a \$100 million campus development plan that will take 20 years to complete. This would include off-street parking facilities for students, a new academic building to showcase the University's science programs, a new field house to address the long-standing and critical need for recreational facilities, a new laboratory building and/or a new dormitory. All of these will be built around a central quadrangle of open space, which will enhance the University's unique green, urban environment, and provide a link for an existing community park, The Woodlands, and a proposed Botanic Trail. A new 650-space parking lot will help ease congestion and parking issues in the community, freeing up space for commuters who use the trolley, residents, and consumers at local businesses.

Presently, the University campus is somewhat fragmented. A major thoroughfare into downtown Philadelphia runs through the center of the campus and currently contains pedestrian, vehicular, and trolley traffic. On the southwest side, the campus backs up to the historic Woodlands Estate now located in a 55-acre cemetery. While this is being promoted as a tourist attraction as part of a West Philadelphia revival effort, very few tourists would venture beyond this point. On the other side of the campus, the 11+ acre tract containing the abandoned Breyers Ice Cream plant abuts a newer part of the campus.

The first phase of this plan addresses current safety and appearance issues. It involves the demolition of the ice cream plant that covers more than half of the total acreage of this new plot. This structure, parts of which are 75 years old, has fallen into a state of severe disrepair. Since Breyer's Ice Cream left the Philadelphia region, this dilapidated, abandoned structure has been an eyesore for the community as well as a reminder of lost jobs. In addition to the removal of the Breyer's Ice Cream plant, the first phase of the development plans calls for improving the safety of the campus, beautification of the area and creating a more integrated campus. To address these concerns, the University of the Sciences in Philadelphia plans to make several improvements to the roads bordering or running through the campus. These include redesigning traffic patterns and parking around the campus to be safer and more efficient for pedestrians and commuters; and developing a clearly delineated, geometrically-organized system of pedestrian pathways and open spaces linking the southern and northern campuses.

Philadelphia is a federally designated Enterprise Zone, but the University's neighborhood is just beyond the boundaries of this Center City-focused initiative. The University of the Sciences in Philadelphia, however, is located in West Philadelphia, an area recognized by the Economic Development Administration as an area eligible for federal assistance. The average income for West Philadelphia residents is half of those living in Center City and Chestnut Hill/Mount Airy. The news stories, highlighting crime activity, and general appearance of pockets of West Philadelphia, has been a major concern for prospective students from outside the area.

Unlike other area universities and colleges where the safety of students has forced many institutions to become contained communities, students at the University of the Sciences are active participants in the Philadelphia community. Our students gain valuable training and professional experience from the local community and feed this experience into Philadelphia's growing health care, pharmaceutical and biotechnology economies. These include 160 hospitals, 150 research labs, five medical schools, schools of dentistry, podiatry, optometry and veterinary medicine as well as seventy-five percent of the United States pharmaceutical firms, all located within a two-hour drive of Philadelphia.

The University of the Sciences in Philadelphia is scheduled to receive \$369,000 in earmarked funds through the recently enacted TEA-21 legislation. These funds will be requested as reimbursement in the costs of the beautification of streets surrounding the campus, the development of open green space, and the relocation and diversion of certain side street traffic.

These efforts will contribute significantly to redevelopment efforts currently underway just to the north with very positive implications for the residents of the immediate community in terms of safety and beautification. Recognized by the federal government as an area eligible for federal assistance, the University of the Sciences in Philadelphia is seeking a \$3 million HUD Economic Development Initiative (EDI) grant in the fiscal year 2000 VA, HUD and Independent Agencies Appropriations bill. This Federal help will allow revitalization in West Philadelphia to happen more quickly and lessen hazards associated with abandoned property and mixed traffic thoroughfares.

The proposed campus expansion plan will provide numerous benefits to the University, the community and the City of Philadelphia, including increased job opportunities, a safer community and reduced traffic congestion. The University of the Sciences will be better positioned to continue its long-standing tradition of educating health care professionals. Unfortunately, this will not be possible without the development of this donated land. Regardless of the development plans of the University, the Breyers Ice Cream plant is a hazard, not to mention an eye-sore to the community, that is in desperate need of removal.

On behalf of the students at the University of the Sciences and the community of West Philadelphia, I thank you for your time.

PREPARED STATEMENT OF THE TUBMAN AFRICAN AMERICAN MUSEUM

Mr. Chairman and Members of the Subcommittee, as Director of the Tubman African American Museum I appreciate the opportunity to submit testimony for the record addressing the economic development initiative developed for the Tubman African American Museum.

The Tubman African American Museum is located in Macon, Georgia and is Georgia's largest African American Museum. Founded in 1981, the Museum is dedicated to educating all people on aspects of African-American art, history, and culture. In addition to its permanent and visiting art exhibits, the Tubman hosts concerts, plays, celebrity storytelling and frequent lectures by well-known authors. Through workshops, festivals, publications, youth camps, special events, and community and school outreach programs, the Tubman offers school children and the residents of Macon, Georgia a forum for social and cultural understanding in an accurate and historical perspective.

Mr. Chairman, the Tubman African American Museum is clearly a leader in educating people about African-American art, history, and culture. Numerous articles in national publications attest to the fact that the Museum is already having a large impact on many lives. Recent articles in the Washington Post and the Wall Street Journal and segments on NPR, PBS, and CNN highlight the positive influence the Tubman is making in the Macon community. The Tubman not only provides resources to the local community, the Georgia Council for the Arts also recognizes the Museum as the 38th out of 184 art organizations in the State of Georgia.

The Tubman's popularity and public visitation continues to grow at a rapid rate. In the last five years, the Tubman has grown from less than 5,000 visitors in 1992 to more than 65,000 in 1997. We have documented that visitors come from around Georgia and from all fifty states to visit the Tubman African American Museum. As audiences grow, it is apparent that the Museum's current facility is no longer adequate to accommodate the dynamic and popular educational and community programming.

The Tubman African American Museum is literally bursting at the seams. Large school groups are often turned away due to the lack of Museum space. The lack of physical space also makes it difficult to meet the public's demand for public lectures,

workshops, and summer camp, forcing the Tubman to rent space “off-campus” for these activities.

The turn-of-the-century building that currently houses the Tubman is substandard in many ways. The ceilings throughout the building are eight feet tall, making the facility inadequate for many exhibitions. In addition, the current facility does not have a loading dock or elevator, limiting the Museum to a variety of exhibits. Limited space at the Tubman also confines the Museum to only display 5 percent of its permanent and prized collection, “The Noel Collection.” The Noel Collection represents thirty years of Lynn and Michael Noel’s acquisition of thousands of pieces of African-American art. As a contribution to understanding African-American art and culture, the Noels have honored the Tubman with pieces of their collection to display at the Museum. Unfortunately, about ninety-five percent (95 percent) of the collection is in storage in Houston.

In 1997, as a result of the Tubman’s facility restraints, the Museum’s Board of Directors and Executive Director undertook a long-range planning study to determine ways in which the Museum can appropriately expand its services to state and regional suffices and to position itself as a primary tourist attraction. After carefully planned research and feasibility studies, the decision was made to build a new Tubman African American Museum seven times the current size. The new Tubman African American Museum will be located in the heart of downtown Macon. Positioned downtown near the Georgia Music Hall of Fame and the Georgia Sports Hall of Fame, the new Tubman African American Museum will be another added attraction to bring tourists to vibrant downtown Macon.

The development of a new Tubman African American Museum promises great economic growth for downtown Macon, Georgia. In fact, this initiative is one of the top priorities for the “New Town Macon,” Macon’s downtown revitalization organization. The Mayor of Macon, City Council, County Commissioners, and a wide range of community organizations have endorsed this project as an important component of downtown’s economic development efforts. To this end, the City and the County have pledged funds in support of the new Tubman. In addition to public funds, the Tubman has initiated a private capital campaign to raise funds for the \$15 million project.

Mr. Chairman and Members of the Subcommittee, I urge your careful consideration in awarding the Tubman African American Museum with an Economic Development Initiative (EDI) grant in the amount of \$5.2 million. An Economic Development Initiative grant would complement our community, state, private, and local support and funds for the Tubman’s program growth and facility expansion.

With the Tubman’s history of contributing to Macon’s social, economic, and educational growth, we hope that the Senate Appropriations Subcommittee on Veterans, Housing and Urban Development, and Independent Agencies will take careful consideration in awarding the Tubman a grant for fiscal year 2000.

Mr. Chairman, I would like to take this opportunity to thank our Georgia Senators, Senators Paul Coverdell and Max Cleland, and their staffs for their leadership and efforts in supporting this project. The Tubman African American Museum and the citizens of Macon appreciate their commitment and hard work.

Mr. Chairman, thank you for this opportunity.

PREPARED STATEMENT OF THE CITY OF NEWARK, NEW JERSEY

Mr. Chairman and members of the Subcommittee, thank you for giving us the opportunity to submit testimony about projects under your jurisdiction that are critical to the people of Newark, New Jersey. Newark is truly at a crossroads: we are a City with all of the problems of many major urban centers, but we are also a City with vast potential. We have begun to turn the corner—there is a renewed vitality and sense of optimism in Newark.

Our downtown is undergoing vibrant revitalization. The acclaimed New Jersey Performing Arts Center (NJPAC), which includes a new public plaza open space, opened in 1997. An adjacent waterfront park and historic area along the Passaic River is scheduled to begin construction by the U.S. Army Corps of Engineers later this year, and a minor league baseball stadium where the Newark Bears will begin to play this summer is almost completed. Renovated office buildings, and new retail spaces add to the mix of activities which are all changing the face of Newark. But we know that the renaissance of our City cannot just happen in the downtown business and arts center; it must also include the residents and their neighborhoods in meaningful, substantive ways. The proposals for economic development activities outlined herein may be disparate, but they all relate to improvements in the quality of life for residents of and visitors to Newark.

Newark is the largest City in New Jersey, with 275,221 residents in 1990, and ranks sixty-third in the nation in population. Newark's twenty-four square miles of land makes it the smallest of the country's top one hundred cities, with the fifth highest population density in the nation. Much of our land is taken up by Newark International Airport, higher education and medical facilities, and other institutional uses, increasing the density of our actual "livable" space. The median family income, according to the 1990 Census, was only \$25,816—as opposed to \$47,589 for the State—and our population is five years younger than the State average. Twenty-nine percent of our population was under the age of 18, and twenty-six percent lived below the poverty line. For people living in these conditions, there are basic needs which must be met: the availability of open space and recreation areas, the availability of jobs, and the availability of an infrastructure which is conducive to the development of business and industry.

Fundamental to the goal of bringing Newark back is the revitalization of its neighborhoods. Key to this improvement is the revitalization of municipal parks in some of our poorest and most densely populated areas, in full partnership with neighborhood residents and community based organizations. Toward this end, the City of Newark seeks the assistance of this Subcommittee in securing funding to execute a plan to revitalize neighborhood municipal parks. Projects have been selected in each of the City's five wards, with specific strategies developed for each. The City of Newark will make every effort to match dollar for dollar federal support through its operating and capital budgets, staffing and in-kind services. Support is also expected from the private sector, including foundations, corporations and individuals.

The City's Department of Neighborhood and Recreational Services will embark on a community partnership for parks strategy, currently being tested in the largest municipal park, Jesse Allen Park. A local grassroots campaign with advertising will be coordinated to invite all neighborhoods surrounding each of the thirty-five small city parks to collaborate and make theirs a community park according to the established process. In each of the cases described below, a "Friends Of" park association is being formed of citizens who live around the park, and anchoring community institutions, such as schools, the faith-based community, community development groups, and local agencies. Each association will be helped by the City to form a board and become a 501c3 non-profit organization. Each group will be expected to get at least 10 percent of the surrounding neighborhood residents to join the association and donate at least one dollar, and will participate in joint orientation and training with peers from similar groups city-wide. The City will award additional funds for that particular park, which the "Friends Of" group will help to administer to execute improvements and create programming. It is anticipated that funding will be in the amount of \$1,000 per acre of park, plus matching with various foundation and corporate partners.

Federal support will be utilized to match municipal capital investment in improvements. The City administration will maintain its current efforts and services, such as lawn mowing, trash removal and basic landscaping. In addition, our comprehensive strategy will include support from other municipal departments. The Engineering Department will address capital needs, develop comprehensive physical plans and drawings for each park, compiled in consultation with the community group. The Police Department has pledged to create walk-ride units of officers who patrol in and between specific parks, train watch groups who undergo association training, and organize police youth and adult athletic leagues to compete in the parks. The Newark Public Information Office will coordinate the communications and media strategy, both for initial outreach and with each association in determining its own campaign direction and format.

The specific municipal parks that have been identified for participation in the demonstration project and the unique strategies for each are briefly described below.

Riverbank and Independence Park in the East Ward.—These parks are in the crowded Ironbound section, where the neighborhood has very little open space. The City is working with local groups to develop the designated park area near the Passaic River with jogging trails, soccer fields, and new open space.

Jesse Allen Park in the Central Ward.—This park is adjacent to one school and near several others. It was recently the focus of several discussions and meetings with community groups. It is in the heart of the City's poorest area, and has been subject to repeated vandalism. The City and the newly formed Jesse Allen Park Association are working jointly to develop and execute a plan that includes the refurbishment of ballfields, a revitalized playground, a new concert area, and security measures.

Kasberger Field in the North Ward.—These playing fields and recreation area are virtually hidden in the neighborhood in North Newark. It has attracted the atten-

tion and interest of many little league groups who want to help fix up the facility for ongoing use. A security fence, lighting and better drainage have been identified as vital needs.

Boylan Center and West End Park in the West Ward.—Boylan is the only City recreation Center in the West Ward, and West End is the only municipal park. Both need landscaping, furniture and signage to better serve their local area populations.

Mildred Helms Park and St. Peter's Recreation Center in the South Ward.—Mildred Helms is a long narrow park in the heart of a dense residential neighborhood. It adjoins an elementary school, but is littered with crack vials, debris and broken glass, and has broken playground equipment. Yet the area children play there daily, as it is the only open space in the immediate area. This is a site where neighborhood organizing will potentially enable substantial change in the environment. St. Peter's is a complex including basketball courts, a pool and a center building on the other side of the ward. This facility, too, is in need of community support to overcome chronic vandalism and return it to full utilization.

The City of Newark is seeking the support of this Subcommittee for a \$5 million allocation to help to implement the City's overall strategy for park and neighborhood revitalization. Based on community partnerships and a sense of pride and ownership, the children of Newark will truly have the opportunity to be a part of the City's renaissance.

The second project is one that will have a tremendous impact on the redevelopment of industrial property close to Newark International Airport, known as the Airport Support Zone. In order to accommodate the expanding businesses which must be close to the airport and Port Newark/Elizabeth, adequate drainage and unflooded roadways are necessary. Simply put, the roadways in this area are prone to flooding, making access to local firms and homes impossible. Motorists are often stranded during severe rain, and the ground floors of some area businesses become waterlogged.

The South Side Interceptor/Queens Ditch are the principal stormwater conveyances draining the southern part of the City of Newark. The South Side Interceptor picks up stormwater in the vicinity of Weequahic Park and carries it to the Queens Ditch in the vicinity of Newark Airport. Queens Ditch empties into the Airport perimeter ditch, before discharging into the Newark Channel at Port Newark. Both conveyances suffer from collapsed sections, heavy sedimentation due to relatively flat gradients, and other blockages. The result is insufficient capacity, leading to flooding on several key traffic arteries. Major rehabilitation is required to restore flow and capacity.

The project is critical to support expansion of Newark Airport. The redevelopment of Frelinghuysen Avenue—the heart of the Airport Support Zone—and the Waverly Yards property—an old railroad facility directly across Rte. 1 from the Airport—are vital. This area is located immediately adjacent to the Northeast Corridor, the Airport Monorail Extension, and a proposed conference center and hotel complex. Reconstruction of the South Side Interceptor will eliminate the flooding problems on Frelinghuysen Avenue, especially in the vicinity of the critical connections with Route 22 and I-78. The removal of standing water will enhance the connections of this area to Newark Airport and further its development as an Airport Support Zone. The rehabilitation of the Queens Ditch will reduce flooding in the vicinity of International Way and Waverly Yards. The combined project cost is estimated at \$10,000,000.

The Newark Museum's New Science Initiative is another project which ties together economic development, community outreach and educational opportunities. The Museum is recognized as one of the nation's leading cultural institutions, and serves almost a half million adults and children each year. Science-related programs draw more visitors than any other offerings.

Realizing the opportunity to attract larger audiences and better serve Newark and New Jersey residents, the Museum has embarked on a new science initiative. In planning the program, the Museum staff has been guided by the principles contained in Goals 2000 and by New Jersey's recently adopted Core Curriculum Content Standards. Critical thinking, mathematical and scientific understanding will be fostered as visitors question, experiment, compare, and analyze real specimens from the Museum's science collections, and participate in planetarium and Mini Zoo programs developed to effectively communicate complicated and abstract science concepts.

The Newark Museum seeks \$2.0 million to support the Science Initiative. The City of Newark has committed \$1.7 million to date toward the preparatory collections care necessary to make this initiative possible. Additionally, The Museum plans a \$5 million operating endowment fund based upon a public/private partner-

ship to assure adequate on-going support, of which \$1.2 million has been raised to date.

The final project brought to the Subcommittee for consideration is a major economic development initiative that will create a professional sports and entertainment complex in downtown Newark. It is being planned by a consortium of private businesses, nonprofit representatives and the City administration. As this new economic development initiative is evolving from preliminary to concrete plans, there is a unique opportunity for an important downtown facility linked to a key transit hub.

This project will use the attraction of a major league sports franchise to locate a state-of-the-art arena as a key cornerstone for development. The mission of this project is to harness the momentum initiated by the successful opening of NJPAC, and create a vibrant, state of the art sports and entertainment district in downtown Newark. It will be a catalyst to the evolving creation of a vibrant downtown corridor—as development continues based on strong anchors elements. These include NJPAC, the Gateway complex of modern office buildings, the Newark Museum and Main Library, the refurbished Newark Penn Station, the new Joseph G. Minish Waterfront Park, and the Newark Bears baseball stadium. A new light rail system, the Newark Elizabeth Rail Link, is in final design, and will ultimately be the spine along which these projects are arrayed.

The preliminary plan for the Newark Sports and Entertainment Center master plan consists of a covered multi-purpose sports arena with 19,000 seats, ancillary parking, a new television production and broadcast complex, up to 2 million square feet of new commercial and retail space, including hospitality facilities. The sports and entertainment center will provide superior access to a broad customer base, create sizable, measurable, bankable fiscal benefits for the taxpayers of New Jersey, and will, consistent with the commitment of the New Jersey State Plan, “steer development from environmentally sensitive zones and back into urban areas.” As the project creates a destination location—which will create new incremental spending—it will help to revitalize New Jersey’s oldest and largest city and establish a new sports paradigm linking professional athletes to the youth of the state.

The Newark Sports and Entertainment Center is expected to draw nearly two million people to the city each year. The estimate includes those attending sporting events, family entertainment shows like the circus, concerts and other attractions. In addition, the development of the Newark Sports and Entertainment Center will act as a catalyst to the increased demand for and opening of restaurants, shops, hotels and small service businesses that meet the needs of patrons. Local corporations, small businesses, city residents, and local employees are expected to benefit from the Newark Sports and Entertainment Center through improved quality of life, better entertainment and retail options for its current workforce, and improved job opportunities. At least 5,000 jobs in construction, ancillary services and direct employment are anticipated.

A unique aspect and public benefit of this project is the establishment of a foundation to benefit inner-city youth in New Jersey. Community Youth Organization (CYO) has been formed by the largest investor in the ownership group of the NJ Nets. CYO will be a partner in the profits of the team, and is committed to investing its profits in children, people and businesses in Newark.

The total population of the region in a 25-mile radius of Newark—excluding New York—is 5,088,656, and includes New Jersey’s five most populous cities. In an approximate 10 mile radius of Newark, the population is 2.1 million with a median family income of \$54,683. This contrasts with Newark’s population of 265,000 and median income of half that of residents in the 10 mile radius. A recent survey of Newark’s mid-day population found 266,000 local residents, 52,000 non-resident workers and 24,000 non-resident students. The six colleges and universities in the city have over 45,000 students and faculty. Newark is also home to major corporations, including Prudential Insurance, Continental Airlines, Blue Cross/Blue Shield of NJ and Public Service Electric and Gas. Newark’s Penn Station, a stop on the Northeast Corridor for Amtrak as well as New Jersey Transit trains and buses from throughout the State, is only a short walk from the proposed sports and entertainment complex. This concentration of people with discretionary income for entertainment and dining, and easy access to public transportation, will be encouraged to use this significant purchasing power in the City of Newark.

The ownership group for a major league sports franchise has indicated the ability to contribute approximately \$200 million of private funds toward the anticipated \$300 million project cost. The gap in financing will be filled with a combination of tax-exempt revenue bonds (subject to debt limits), user fees and grants related to the job generating abilities and economic development potential of the project. The City plans to use proceeds from parking and hotel taxes to subsidize the project.

The city will immediately benefit by the presence of the Newark Sports and Entertainment Center, as it will pay property taxes on land that is currently city-owned or underutilized.

Public funds are expected to be utilized for site acquisition and off-site infrastructure improvements. The project area includes a large tract of vacant land and underutilized buildings which has been declared an "Area in need of Redevelopment" under the Redevelopment statutes of the State of New Jersey. This Committee's endorsement of an allocation of \$15 million in funding through the Economic Development Administration for site acquisition and project construction is respectfully requested.

PREPARED STATEMENT OF THE DEPARTMENT OF NEIGHBORHOOD AND COMMUNITY SERVICES, CITY OF TALLAHASSEE, FLORIDA

Mr. Chairman, I would like to thank you and the Members of the Subcommittee for this opportunity to submit testimony to discuss the commitment and the partnership between the City of Tallahassee and Florida State University for the comprehensive revitalization of the oldest historically African American community in the capital of the State of Florida. We are requesting your support for an Economic Development Initiative grant for \$3.5 million to assist us in our efforts to develop an \$80 million arts and entertainment district that would rebuild the economic and employment base of this community.

Frenchtown, established in 1841 by French settlers who created a small enclave of homes and businesses is one of the first neighborhoods established in Tallahassee. After suffering many hardships the French gave up on this area, which after the Civil War was then claimed by freed slaves. The Frenchtown neighborhood grew as a community and for over 100 years became the economic and cultural center of Tallahassee's Black Community.

In the late 1950's and early 1960's with the onset of integration, the closing of the historically Black high school, and the urban flight that occurred continued into the 1970's and 1980's the Frenchtown community began its downward spiral of social and economic decline.

The deterioration of the Frenchtown community can be traced to a breakdown in the basic cycle of community regeneration. People who raised their families in Frenchtown have aged and remained. Their offspring faced with the increase in urban decay, coupled with the phenomena of expanded choices brought on by integration, chose not to develop their lives in Frenchtown. The children who were raised in the Frenchtown community, opting for the expanded choices brought on by integration accelerated the trend of decline in the social, cultural, economic and home-ownership base of Frenchtown.

The City of Tallahassee has joined with the citizens who have remained and have undertaken the implementation of a long standing commitment for the comprehensive revitalization of this community strategically located in the center of the urban core of Tallahassee. Frenchtown has the potential to become one of the most desired and diversified neighborhoods in the City. The Frenchtown community is within a one mile radius of two major state universities, Florida A&M University and Florida State University. Florida State University is located directly across the street from the Frenchtown community. The State Capitol, the Tallahassee-Leon County Civic Center and the City's downtown, which accounts for over 15,000 jobs and the hub of the City's public transportation system are all located on the southern boundary within a four block radius of Frenchtown. The City's plan for redevelopment of this community is all encompassing. It consists of a concentrated effort to rebuild the home-ownership base of the community, to revitalize the main commercial thoroughfare of the community, to preserve the historic and cultural institutions of the community and through the development of the Frenchtown Arts and Entertainment District to recapture the legacy of Frenchtown as a center for commerce and entertainment for the Tallahassee community and provide a major infusion into the employment base of Frenchtown.

A comprehensive neighborhood revitalization strategy, in order to be successful must seek to create partnerships among federal, state and local governments, the private sector, community organizations and neighborhood residents. In this pursuit, the City of Tallahassee and the Florida State University (FSU) have formed a partnership, coming together and combining key aspects of their major development and redevelopment activities to develop a \$85,000,000 Economic Development Initiative, the Frenchtown Arts and Entertainment District. This partnership will result in the linking of the University's proposed \$40 million new performing arts

center with the City's proposed \$45,000,000 Frenchtown Arts and Entertainment Complex. This City/University partnership will encompass the following activities:

- A joining of the University's and the City's respective development and redevelopment efforts, which are on either side of US highway 90 (Tennessee Street), through an attractive and convenient pedestrian promenade. The promenade would link the exit of the Arts and Entertainment Complex's 1,000 space garage in Frenchtown with the entry of Florida State University's Fine Arts Complex which is anchored by a 1,200-seat Performing Arts Center.
- The development of a 261,000 square foot Arts and Entertainment Complex constructed around an 1,000 space parking garage. The Complex includes a 75,000 square foot museum of African-American History Science and Technology, a 60,000 square foot 100 unit suites hotel, 30,000 square feet of retail shops, 20,000 square feet of restaurants and night clubs, a six-plex movie theater and 76,000 square feet of apartments and condominiums.

The Economic Development Initiative grant is a critical element of this project. The funds will be used to cover the finance charges for the first ten years of a \$8,000,000 108 loan. The 108 loan proceeds will be used for property acquisition and for the installation of infrastructure for the Frenchtown Arts and Entertainment Complex.

This development of this complex will create approximately 300 temporary jobs and 500 permanent employment and training opportunities for very low income individuals who are transitioning from welfare to work and for other low- and moderate-income persons from the Frenchtown community specifically, and from other low income neighborhoods of Tallahassee. The development of this Complex on this site will complete the revitalization of the Frenchtown commercial district, returning it once again into a viable commercial, cultural, residential and employment center.

The acquisition of the site for the Arts and Entertainment Complex with the 108 loan proceeds will remove from this community slum and blighted conditions. These conditions that exist on the site stem from vacant dilapidated abandoned buildings and vacant lots that foster illegal drug traffic, vagrancy, illegal dumping and other crimes.

The development of this project will satisfy all of the requirements associated with the Economic Development Initiative Grant and the Community Development Block Grant Programs.

Mr. Chairman, granting this request will position us to complete the comprehensive revitalization of this community. It will enable us to return the Frenchtown community to the time when it was a center of employment opportunity, business ownership, home-ownership, entertainment and a thriving cultural life.

Again, I thank you for this opportunity to request your support of our efforts to rebuild this neighborhood.

PREPARED STATEMENT OF HAMPTON UNIVERSITY

Mr. Chairman and members of the Subcommittee, I am Dr. William R. Harvey, President of Hampton University in Hampton, Virginia. I would like to thank you for allowing me the opportunity to testify in front of the Senate Appropriations Subcommittee on Veterans Affairs, HUD, and Independent Agencies to discuss the development of the Technology Implementation Initiative, an important effort currently underway at Hampton University. Hampton University is requesting a \$3 million Economic Development Initiative (EDI) grant in your fiscal year 2000 Veterans Affairs, HUD, and Independent Agencies Appropriations Bill to help implement the Technology Implementation Initiative.

About Hampton University

Hampton University is a comprehensive institution of higher education, dedicated to the promotion of learning, building of character and preparation of promising students for positions of leadership and service. Its curriculum emphasis is scientific and professional with a strong liberal arts undergirding. An historically black institution, Hampton University is committed to multiculturalism. The University serves students from diverse national, cultural and economic backgrounds. From its beginnings to the present, the institution has enrolled students from five continents: North America, South America, Africa, Asia and Europe and many countries including Gabon, Kenya, Ghana, Japan, China, Armenia, Great Britain and Russia, as well as the Hawaiian and Caribbean Islands and numerous American Indian nations.

Research and public service are integral parts of Hampton's mission. In order to enhance scholarship and discovery, faculty are engaged in writing, research, and grantsmanship. Faculty, staff and students provide leadership and service to the University as well as the global community. In achieving its mission, Hampton University offers exemplary programs and opportunities that enable students, faculty and staff to grow, develop and contribute to our society in a productive, useful manner.

The Technology Implementation Initiative at Hampton University

According to the Institute for Higher Education Policy, the top information technology challenges confronting colleges and universities include helping faculty integrate technology into instruction, providing adequate user support, and providing the appropriate financial planning for information technology. More college courses are using technology than ever before. The percentage of classes using e-mail increased to 44 percent in 1998, up from 33 percent in 1997, 25 percent in 1995, and only 8 percent in 1994. Today, one-third of all classes are using Internet resources as part of the syllabus, compared with 25 percent in 1997, and 15 percent in 1996. Further, almost one-fourth of all college courses are using World Wide Web (WWW) pages for class materials and resources, compared with 8 percent in 1996 and only 4 percent in 1994.¹

Hampton University recognizes that the quality of undergraduate education must keep pace with the needs of students who will take their place in an information intensive workplace. The University also recognizes that its teaching faculty should be sensitized to the potential benefits and trained in these new and emerging technologies. In order to address the needs of our students and faculty, the Technology Implementation Initiative concept has been initiated as a university-wide project that plans to integrate educational technology with the teaching and learning environment.

The Technology Implementation Initiative is designed to enhance Hampton University's ability to provide cutting-edge technological services in order to create an interactive web that will link the entire Hampton University community all over the globe, including learners, faculty, staff, and the community. The Technology Implementation Initiative will fully integrate the Hampton University campus infrastructure in a unified secure network. The administrative and academic buildings and dormitories will be wired for the delivery of the Internet and the University's Intranet system. The Initiative will also expand the University's uplink/downlink capabilities to develop distance learning relationships through on-site programs in the Caribbean, Africa, Europe, and other settings.

A key to the success of the Technology Implementation Initiative will be the development of our faculty's technological skills. Workshops and programs will be offered to our faculty and staff that will focus on the integration of technology in the classrooms and in the community.

The Technology Enhancement Initiative will incorporate the development of the Academic Technology Mall (ATM), a comprehensive service center designed to support information literacy and promote the application of new and emerging educational technologies that enhance the teaching-learning process. The ATM currently serves as the hub of a campus-wide network that distributes voice, video, and data throughout key instructional and administrative buildings. The ATM facility is composed of a public access laboratory, faculty development laboratory, computer classroom, electronic classroom, and the media productions department.

The Technology Implementation Initiative will provide for a student-focused entity that offers an array of computer and multimedia services and resources. It will foster a creative work environment where students utilize self-directed and self-paced technologies in identifying, accessing, and generating data and documentation needed for their courses and research applications. The student laboratory will consist of Pentium and PowerMac computers, Internet access, and a wide variety of software, printers, and other peripheral equipment that are fully networked.

Mr. Chairman, Hampton University's goal is to become the preeminent minority research institution capable of competing with majority institutions. The creation of the Technology Implementation Initiative will greatly enhance Hampton University's position as a leading minority research institution. It will spur further business and scientific investment in the Tidewater region, and will create an ideal atmosphere for coordinated, interdisciplinary research at the University. The Initiative will enable Hampton University to be better positioned to attract collaborative research between the University and national laboratories and industry, and thus

¹Institute for Higher Education Policy. February 1999. *Distance Learning in Higher Education*. Data available from <www.ihep.com>.

enhance the academic, scientific, and economic climate of the University and the entire Tidewater region.

I thank you for this opportunity to testify.

PREPARED STATEMENT OF THE COLLEGE OF AGRICULTURE AND TECHNOLOGY AT
MORRISVILLE, NEW YORK

Mr. Chairman and members of the Subcommittee, I am Dr. Ray Cross, President of the College of Agriculture and Technology at Morrisville, New York. I would like to thank you for allowing me the opportunity to testify in front of the Senate Appropriations Subcommittee on Veterans Affairs, HUD, and Independent Agencies to discuss the development of the Telecommunications Center for Education, a vital initiative currently being developed by the SUNY Colleges of Technology (UCT) Alliance. The UCT Alliance is requesting a \$3 million Economic Development Initiative (EDI) grant in your fiscal year 2000 Veterans Affairs, HUD, and Independent Agencies Appropriations Bill to help develop the Telecommunications Center for Education.

The UCT Alliance is a strategic partnership of the State University of New York's five colleges of Agriculture and Technology that has been created to better serve the educational and economic needs of the people of rural New York. The UCT Alliance colleges, located in Alfred, Canton, Cobleskill, Delhi, and Morrisville, have historically shared a common emphasis on experiential and "practical" learning through extended laboratory and internship experiences. The UCT Alliance has established relationships with business and industry across New York, and sponsors partnerships with high schools in their region. Through local Advisory Committees, the Alliance Colleges maintain close contact not only with local businesses and industry, but also with both the public and private sectors throughout the state. The Alliance Colleges are thus uniquely situated to assist in the economic development of the region.

In order to effectively transform the five Colleges of Agriculture and Technology into more collaborative institutions and assist the Alliance's students and local communities, each campus must upgrade their respective distance learning technologies and facilities. To obtain this goal, the UCT Alliance is developing the Telecommunications Center for Education. The Telecommunications Center for Education will create a virtual campus that will fully connect and integrate the more than 14,000 students currently enrolled in the five colleges. We know from recent semesters that the current and future demands for these types of services far exceeds our current ability to provide these needed resources.

The Telecommunications Center for Education will house a variety of cutting-edge telecommunications equipment designed to enhance instruction and learning. The centers will contain "classrooms of the future," which will be equipped with videoconferencing/distance learning equipment, computer ports and cabling for networking, and technology that will provide access to satellite downlinks and uplinks. These high-tech conferencing and instructional facilities will make it possible for each campus to fully develop its capacity as a workforce training center for its students and the region's business community.

A mainstay of the economy throughout New York State, agriculture and technology training is highly specialized and critical to the nation's economy. Training for these careers, however, is not widely available in New York. In addition, employers in such fields as manufacturing, construction, physical therapy, and telecommunications continue to clamor to hire skilled employees. Students in the rural areas of upstate New York, though, do not have the exposure and resources to properly train to be competitive for the industries.

Through the Telecommunications Center for Education, The UCT Alliance will step fully into its role of providing training centers for the skilled technical workforce. The Telecommunications Center for Education will provide benefits to the agricultural community by creating linkages to agriculture-related businesses and institutions. These linkages will spur the development of a more skilled workforce, enhance competitiveness in national and international markets, and stimulate many of the diverse facets of the rural economy.

The Alliance has a responsibility to not only generate new knowledge, but to deliver that knowledge to businesses and citizens in our area. Business and industry located near each of the alliance colleges are interested in providing continuing education for their employees. On each of the campuses, the Alliance will also make the distance learning centers available to these businesses as centralized, off-site training centers. In other cases, the video-conferencing/distance learning capabilities will make it possible to deliver instructions and training directly to the worksite.

In the future, the Alliance Colleges will work to develop training contracts with national companies based in New York State and other neighboring states to deliver specialized coursework over video networks to train employees on the new technologies and techniques needed to remain competitive in the global marketplace.

Rural communities are faced with the very real need to provide a better and more highly trained employment base. The Alliance Colleges have accepted this mission and are creating the Telecommunications Center for Education as a model demonstration that can be replicated in numerous other states whose rural communities are facing similar challenges. For these reasons, the UCT Alliance is seeking initial federal funding of \$3 million in the fiscal year 2000 Veterans Affairs, HUD, and Independent Agencies to help develop the Telecommunication Center for Education. This is part of a two-year federal request of \$6 million, out of a total project budget of over \$14 million. This federal partnership, in conjunction with the over \$8 million to be provided by the State of New York and from private sector resources, can help make the mission of a more highly trained and technologically competitive rural America a reality in the years to come.

I thank you for this opportunity to testify.

PREPARED STATEMENT OF THE INFORMATION TECHNOLOGY CENTER AT FAIRFIELD
UNIVERSITY

Mr. Chairman, thank you for providing the opportunity to submit testimony concerning an important initiative Fairfield University is undertaking to ensure the progress of information technology education and training in two educationally underserved cities in the State of Connecticut. In particular, my testimony addresses the need to establish an Information Technology Center, and the importance of such a resource as a logical step in advancing the knowledge of information technology among primary and secondary school students and adults in and around the cities of Bridgeport and Norwalk. As President of Fairfield University, I would like to provide the Subcommittee with a brief overview of the state-of-the-art resources that the University can bring to address the educational and workplace challenges brought about by technology.

As you are aware, constant advances in technology have resulted in an ever-changing workplace environment. This is especially true for the computer industry, where the Labor Department estimates that an average of 95,000 new computer scientists, systems analysts and programmers will be needed every year from now until 2005. As a result, studies have indicated that to ensure national economic growth into the millennium we must prepare our school systems to meet the demands of the technological era by providing cutting-edge skills at the primary and secondary level. In addition, educational programs must also be developed at the collegiate level for university students, as well as for returning adult students who need to modernize or enhance their skills.

Fairfield University, a leading university in Connecticut, has proposed a solution to meet the occupational needs in its State for the twenty-first century. The proposal involves the utilization of an existing state-of-the-art telecommunication infrastructure that will provide educational programs and training to children at local primary and secondary schools, to returning students through satellite learning programs, as well as to students throughout the University.

The proposed Fairfield program is unique for a number of reasons. First, it will provide technical education and training for primary and secondary school students studying in local urban public schools. A recent study published by the National Assessment of Educational Progress indicated that more than half of urban public school students, many from areas similar to those surrounding Fairfield, scored far below national averages in reading, math, and science. The Fairfield programs will reach students who have historically not received extra support for basic and advanced technical skills and training. While school funding at the local level remains scarce, this program will assist public schools to advance the skills of its children without tampering with its budget. Second, similar to the federally funded School-to-Work movements, these newly founded programs will help students to improve and excel in basic and advanced educational areas, while simultaneously preparing them to enter a modern-day workforce. As a result, the programs offered by Fairfield will prove beneficial to securing economic growth for the State.

Another feature that makes the Fairfield telecommunication infrastructure unique is its ability to provide technical training through the creation of its convenient satellite learning programs. This is especially important for returning adult students who need to modernize their skills in order to be competitive in the contemporary workplace. Recent State of Connecticut employment cutbacks in the banking, insur-

ance, and manufacturing industries have produced alarming unemployment rates among its highly trained workers. Fairfield University is prepared to meet the challenges posed by this problem through satellite learning programs that will train these workers so they can re-enter the workforce. In addition, the satellite learning programs will target members of the community who have little or no technical skills, so they also can obtain work in the technical field. The benefits of satellite learning programs from Fairfield University are then twofold: The programs will decrease recent State unemployment rates among highly-skilled workers, and concurrently provide better job security for the low-skilled and low-income wage earner.

As Connecticut seeks to address the educational needs of its citizens and meet the workforce needs of employers it must develop strategies for capitalizing on the resources and strengths of its higher education system.

Technology uses at Fairfield University: A Career Preparation Model for the State of Connecticut

There is a need in the State of Connecticut and across the country to create partnerships between institutions of higher learning and the community. The primary focus of these collaborations should be with secondary education and business/industry. The proposed relationships can reduce high school dropout rates by infusing added resources and expertise into the school system, and can increase the caliber and breadth of job-training opportunities for local industry.

The computer industry has initiated outreach efforts, putting equipment and software into schools to train students in information technology, helping to increase skills and combat the shortage of high tech employees. For example, it has been estimated that currently there are approximately 350,000 computer programmer and system analyst jobs vacant in the U.S. These companies cannot sell products without a skilled workforce to install and service systems. Unfortunately, privately funded pilot programs cannot be set up in every U.S. city. Institutions of higher education in partnership with industry can fill this gap for training in information technology.

Telecommunications technology is the vehicle through which institutions of higher education can provide broader educational access to the community. Students, educators, parents, senior citizens, and the unemployed are just a small sampling of the potential recipients of on-line training sites throughout the community.

Connecticut's Fairfield University possesses a singular, award-winning resource that can bridge the gap and help accomplish these goals. An already established state-of-the-art telecommunications infrastructure consists of a fiber system that reaches every computer in every classroom, faculty office and student residence hall. In total, 23 campus buildings share voice, video, and data services. The backbone portion of this system was recently upgraded to 155 Mbits from 10 Mbits. In addition, the University operates satellite dishes for program downlinking and teleconferencing and a campus television network with 50 channels, eight of which are programmed exclusively by the University.

Cablevision Head End is a facility on campus providing a high-speed networking hub for Cablevision in Connecticut. Through this resource, voice, video, and telecommunications are made available to Cablevision's residential and commercial customers. This facility has the potential of providing the University with access to Cablevision's entire customer base with national outreach potential. Cablevision Head End is also fiber optic and reaches a broad audience inclusive of local schools, private homes, work places, and community centers.

The academic and administrative staff at Fairfield possesses extensive expertise in working with the local community, as witnessed by the multitude of community outreach projects that complement current programs. These efforts can be greatly enhanced, reaching broader audiences through the development of a comprehensive distance learning curriculum. What is required to take this step is modest when compared to what can be accomplished in a very short time. The establishment of an Information Technology Center will provide the central location for all departments and disciplines to meet, develop, and transmit curricula via television or computer to classrooms, workplaces, community centers, or homes. It will also provide easy access to digital library resources for the students and the business community regionally and potentially statewide.

Establishing an Information Technology Center (Academic Computing, Media, and Technology Training): A Bridge between Fairfield University and the Community.

Building upon the existing telecommunications infrastructure, Fairfield University can provide expanded services to the community. Utilizing a distance learning model, training opportunities can be developed serving the school systems, State

agencies, and businesses. Proposed training opportunities can be designed to increase skills, improving workforce readiness for emerging employment in the State.

Fairfield University plans to upgrade, expand, and renovate a large portion of its library structure and establish a Center dedicated to utilizing the telecommunications infrastructure to improve community outreach efforts from all of the various departments of the University. The Center will have state-of-the-art facilities for distance learning including: Satellite up-link and redistribution; Electronic classrooms; Multimedia rooms; Conference center auditorium; Computing and projection equipment; Electronic information databases; Research in collaborative teaching and learning; and A digital library collection for community and business use.

The Center will be used by the University faculty and staff for internal instruction, and will be available to residents of the surrounding communities on an as needed basis and, through various partnership relationships, designed collaboratively to meet the emerging needs of the community.

Fairfield University has comprehensive career preparation resources that can be utilized and shared with the community. These include: The School of Continuing Education; the Graduate School of Education and Allied Professions; the School of Engineering; the School of Business; the School of Nursing; and the College of Arts and Sciences.

Fairfield University's telecommunication capability is one of the best in the country. The construction of an Information Technology Center will help to coordinate and expand existing outreach as well as provide the foundation for new collaborations. Using expanded technology resources, faculty will be able to design and develop new curricula. The current technology resources at Fairfield, combined with the existing expertise of faculty and administrators, represents a strong foundation upon which this Information Technology Center will flourish.

The specific programmatic components of this Center, in brief, will include information technology and computer training (including Internet-2) as well as a Global Information Resource Center for Fairfield County's corporations. This proposal seeks a federal partnership grant from HUD in the amount of \$3 million to assist in the establishment of the Information Technology Center at Fairfield University to foster the essential dialogue required to ensure that the University's curricula is aligned with the ever-changing needs of society and the workplace.

For these reasons, we believe a Federal partnership demonstration at Fairfield University has the potential to meet the economic development needs of Connecticut's schools and businesses as well as the broader community throughout the State. We appreciate the Subcommittee's attention and consideration of our proposal for such a partnership opportunity.

Thank you.

PREPARED STATEMENT OF THE UNIVERSITY OF MEDICINE AND DENTISTRY OF NEW JERSEY

Mr. Chairman and members of the committee, I am Dr. Stuart Cook and I am the president of the University of Medicine and Dentistry of New Jersey (UMDNJ), the largest public health sciences university in the country. The UMDNJ statewide system is located on five academic campuses and consists of 3 medical schools, and schools of dentistry, nursing, health related professions, graduate biomedical sciences and a school of public health. UMDNJ also comprises a University-owned acute care hospital, three core teaching hospitals, an integrated behavioral health care delivery system, a statewide system for managed care and affiliations with more than 100 health care and educational institutions statewide. No other institution in the nation possesses the resources which match our scope in higher education, health care delivery, research and community service initiatives with state, federal and local entities.

I appreciate this opportunity to appear before you to testify on behalf of two priority projects of UMDNJ which we believe are consistent with the mission of this committee; namely, the Child Health Institute of New Jersey and the Neurological Institute of New Jersey.

The Child Health Institute of New Jersey is located at the UMDNJ-Robert Wood Johnson Medical School (RWJMS) in New Brunswick, New Jersey. Nationally, RWJMS ranks among the top ten medical schools in the percentage of minority student enrollment. The school ranks in the top one-third in the nation in terms of grant support per faculty member. RWJMS is home to The Cancer Institute of New Jersey, the only NCI-designated clinical cancer center in New Jersey; The Center for Advanced Biotechnology and Medicine; the Environmental and Occupational

Health Sciences Institute, the largest environmental institute in the world, and the Child Health Institute.

Disorders of health affecting infants and children exact a terrible toll in both human suffering and economic impact on families and the community. State and Federal public policy places a priority on efforts to prevent and treat childhood disorders. The prevention of conditions such as mental retardation, muscular dystrophy, sickle cell disease or cystic fibrosis has nearly incalculable benefits to society. Although such centers are common in some parts of the country, the metropolitan New York/New Jersey region does not have a research center designed specifically to address issues of child health.

The Child Health Institute is a comprehensive biomedical research center focused on the health and wellness of children. In this program, medical researchers direct efforts toward the prevention and cure of environmental, genetic and cellular diseases of infants and children. The Institute is integral to the long-term plan for the enhancement of research at the medical school in developmental genetics, particularly as it relates to disorders that affect a child's development and growth, both physically and cognitively.

The Institute will be linked physically and programmatically with both the medical school and the Children's Hospital at Robert Wood Johnson University Hospital, the core teaching hospital of Robert Wood Johnson Medical School. Locating the Institute in New Brunswick will promote the development of new partnerships among the Institute, the medical school, the teaching hospitals affiliated with UMDNJ and with the multinational pharmaceutical, biotechnology and chemical interests throughout New Jersey.

The Child Health Institute will act as a magnet for additional growth in research and health care program development in the region. New Brunswick has emerged as the premier "Health Care City" in New Jersey through the efforts of UMDNJ, its schools and affiliated hospital network, and the ongoing support of Johnson and Johnson, the largest manufacturer of health care products, and the Robert Wood Johnson Foundation, one of the largest philanthropic foundations in the world.

The Institute will encompass 83,000 gross square feet and will house more than 40 research laboratories and associated support facilities. Fourteen senior faculty will direct teams of M.D. and Ph.D. researchers, visiting scientists, postdoctoral fellows, graduate students and technicians for a full complement of some 130 employees. At maturity, the Institute is expected to attract \$7 to \$9 million of new research funding annually. The Institute's total annual operating budget is projected to be \$10 to \$12 million. Applying a standard economic multiplier of 5, the total impact on the New Brunswick area is estimated to be \$50 to \$60 million per year. Construction costs for the Institute are estimated at \$27 million, with approximately half of that figure associated with local employment.

The Child Health Institute has already received \$11.8 million in private funding from the Robert Wood Johnson Foundation and from Johnson & Johnson. The Institute has also applied for a \$1 million NIH Research Facilities Construction Grant, and we anticipate some state funds to be available for our research facilities. We respectfully request \$10 million for infrastructure development and program assistance for the Child Health Institute of New Jersey. This combination of state, federal and private resources will enhance UMDNJ's commitment to children, health care and the economic development of our communities.

The Neurological Institute of New Jersey has been established by the UMDNJ-New Jersey Medical School and UMDNJ-University Hospital as a center of excellence in the neurosciences in recognition of the expertise that exists in this discipline on our Newark campus. No other entity in New Jersey approaches the depth of human expertise, technological advancements and research achievements that exist in the variety of services at the medical school and the hospital.

University Hospital is the core teaching hospital of the medical school. It is the major provider of tertiary neurological and neurosurgical services to the State of New Jersey including patient care, education and research. The NJMS Department of Neurosciences is ranked sixth nationally in research funding with about \$4 million annually. NJMS offers the only fully accredited neurosurgical residency program in the state.

The Neurological Institute would serve as an umbrella under which clinical, research and educational efforts would be focused. The delivery of clinical care would be provided through University Hospital, its clinics, physician offices and affiliates. Education would be provided by multi-disciplinary teams focused on neurological disease including prevention, early diagnosis, treatment and rehabilitation. The Institute would collaborate with its regional academic affiliates, the New Jersey Institute of Technology and Rutgers University in promoting research.

Neurological disorders including stroke, epilepsy, multiple sclerosis and Alzheimer's disease are common and debilitating. Neurological diseases are a leading cause of death and disability in the United States, affecting some 50 million Americans. Five million new cases of neurological disorders are diagnosed every year, which is five times the number of new cancer cases diagnosed.

An estimated 4 million Americans suffer from Alzheimer's disease. With the baby-boom generation approaching retirement age, that number could triple in a few short years. Experts say that Alzheimer's is the fastest growing disease of the new millennium and America is ill-prepared to deal with it. New Jersey could be particularly affected. Despite our small size, New Jersey ranks ninth in all states in its number of senior citizens.

Veterans are another group particularly at risk for neurological diseases because of post traumatic syndrome and exposure to chemical agents. More than 500,000 veterans live in New Jersey with some 150,000 residing in UMDNJ's catchment areas.

Neurological diseases and disorders account for about \$400 billion in health care costs and lost productivity.

While the devastation of neurological disease and injury can be horrific, amazing breakthroughs in treatment and new drugs or surgical techniques are occurring. These breakthroughs require painstaking research and testing, significant financial support, and a concentration of clinical expertise and potential research subjects in a controlled environment. Unfortunately, the lack of such a statewide focus in the neurosciences has limited New Jersey's participation in and access to leading edge research, clinical trials and beta-site technology. The Neurological Institute will allow New Jersey to establish the credentials and clinical material necessary to compete for the advanced basic science and clinical research projects that currently are out of reach. Also, the critical mass of expertise provided by the Institute will hasten the pace at which theories become therapies in New Jersey through its educational opportunities and sponsorship of new technology at its clinical sites.

The employment of new MRI technology can aid in the diagnosis and treatment of neurological diseases. We are working on the newest treatments available, and an investment in the work of the Neurological Institute is critical to advance our work. The Institute would focus the attention of pharmaceutical companies on the concentration of patients and availability of physicians and research nurses experienced in drug trials. The Institute will provide direction and coordination to physician referral efforts. Targeted community-based primary care and neurological specialty physicians will be invited to join the UH medical staff and will be conferred member status in the Institute. An ambitious program of continuing medical education in all fields related to neurosciences will be established to provide referring physicians as well as patients with a positive exposure to the academic and clinical proficiency of the Institute.

The Institute seeks a major step forward in the research arena with the acquisition and placement of a state-of-the-art Magnetic Resonance Imaging (MRI) instrument. This MRI, with a rated field strength of 3-4 Tesla, would place New Jersey in the forefront of neuroimaging groups. Imaging instruments with this field strength are expected to provide spatial resolution in the millimeter range and temporal resolution of less than one second—both carrying great significance at physiological levels. Areas of research will include language, learning, memory, visual processing and spatial representation. Clinical applications will include Alzheimer's disease, multiple sclerosis, tumor characterization, and epilepsy where brain dysfunction is clearly established. Applications will also extend to fibromyalgia, chronic fatigue syndrome and post traumatic stress syndrome, where neurological origins are not yet established.

UMDNJ already has established programs in neurosciences at the medical school and at the Veterans Administration Medical Center in East Orange. We are well positioned to conduct research of direct relevance to veterans. We would collaborate with the VAMC and with our research partners, Rutgers University and the New Jersey Institute of Technology, in the development of a neuroimaging lab.

Before assuming the presidency of UMDNJ, I served as Chair of the Department of Neurosciences at the New Jersey Medical School for 25 years. I also served as chair of the East Orange VA Medical Center's Neurology Services for 10 years. I am well aware of the strong, dynamic link between UMDNJ and the Veterans Administration Medical Center. The VA was there for me when I was starting my medical career and I want to be there for the VA to continue providing the very best health education, research and patient care to the men and women who risk their lives in service to our country.

We respectfully request \$1.5 million toward the capital and instrumentation costs from the Department of VA/HUD for the Neurological Institute of New Jersey.

Thank you for the opportunity to appear before you today. We thank the members of this Subcommittee for your leadership in supporting national and international research and development initiatives. This committee has been a strong supporter of the universities and research institutions in this country. Your leadership on many biomedical initiatives is especially appreciated.

ENVIRONMENTAL PROTECTION AGENCY

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS

The National Association of Conservation Districts is a nongovernment association that represents the nation's 3,000 conservation districts and more than 16,000 men and women who serve on their governing boards. Established under state law, conservation districts are local subdivisions of state government charged with carrying out community-based programs for the protection and management of natural resources. Conservation districts work with nearly two-and-half million cooperating landowners and operators and provide assistance in managing and protecting nearly 70 percent of the private lands in the contiguous United States.

Conservation districts work with a number of local, state and federal natural resource agencies in carrying out a wide variety of conservation and environmental protection programs. Partnering with state water quality agencies, state conservation agencies and the U.S. Environmental Protection Agency, districts are key players in implementing federal and state water quality protection and enhancement programs.

Since the passage of the 1972 Federal Water Pollution Control Act (Clean Water Act), tremendous strides have been made in cleaning up point sources of water pollution such as industrial and municipal wastewater discharges. The progress in treating point sources has been made possible, in large part, by an investment of nearly \$100 billion in federal funds for the construction of municipal wastewater treatment plants. Nonpoint sources of pollution—runoff from cropland, construction sites, mining activities, lawns and city streets—are much more elusive targets and pose a significant obstacle to achieving the nation's water quality goals. Pollution prevention remains the key to effectively dealing with nonpoint source pollution.

When Congress enacted Section 319 in the 1987 amendments to the Act, it recognized that nonpoint source pollution control is best addressed through state and locally driven cooperative, incentive-based management programs. With federal assistance and state matching efforts, Section 319 state management programs have resulted in considerable progress in controlling nonpoint source pollution. Some 38 states have also established companion agricultural nonpoint programs that provide technical and financial assistance to farmers and ranchers to help them implement conservation practices that stem runoff.

Although progress has been made, lack of adequate funding is still the primary obstacle to addressing the nation's nonpoint source pollution control problems. After 25 years and a near \$100 billion federal investment in wastewater and industrial waste treatment, the most pressing water quality challenges today revolve around nonpoint source pollution and runoff from animal feeding operations.

Section 319 of the Clean Water Act, which provides grants to states for nonpoint source pollution control, has proven to be a popular and successful tool for addressing nonpoint source water quality concerns. Conservation districts manage nearly 40 percent of Section 319 funds and have a proven track record of success in providing technical assistance to landowners to install practices to stem runoff. However, the workload facing us is considerable and this level of funding—about \$80 million in fiscal year 1999—falls far short of the federal commitment needed to address local needs. The federal dollars invested in Section 319 also leverage considerable state and local resources. Last year alone, state and local governments invested more than \$1 billion in conservation efforts with much of that directed toward water quality concerns. An increase in federal funding will bring even more state and local resources to bear. Conservation districts believe that \$300 million is the minimum needed for EPA's Section 319 grants-to-states program in fiscal year 2000.

Clean Water Act Section 106 State Program Grants are another important tool to help states develop and implement effective water quality protection programs. Matching these funds with their own resources, states are able to better plan and set priorities that more effectively address those needs. Conservation districts recommend a funding level of \$120 million for Section 106 in fiscal year 2000.

In addition to the already pressing need for conservation assistance, EPA and USDA's recently released Unified National Strategy for Animal Feeding Operations (the AFO Strategy) calls for the voluntary development of comprehensive nutrient

management plans (CNMPs) for some 450,000 agricultural operations that are not subject to the National Pollution Discharge Elimination System permit program. Although voluntary, the AFO Strategy will create a tremendous new workload for states to provide assistance to producers in developing the CNMPs. Estimates in the number of staff years needed at the field level to assist farmers and ranchers in this initiative range as high as 8,000 FTEs. The President's budget request recognizes some of this need by requesting \$651 million in funding for its Clean Water Action Plan. However, that funding level still does not meet the on-the-ground needs.

Further, since EPA is moving forward with plans to increase its regulatory oversight of animal feeding operations, we urge the subcommittee to include in its report direction that any additional funds should be used to increase technical and financial assistance to farmers and ranchers to implement the AFO Strategy. Specifically, more assistance should support the development and implementation of integrated pest and crop management systems, nutrient and animal waste management plans, and installation of additional conservation measures to reduce erosion and the resulting polluted runoff.

The Great Lakes National Program (GLNP) has been instrumental in protecting the water quality of the largest freshwater ecosystem on Earth. EPA works with 187 conservation districts in the Great Lakes Basin in carrying out erosion and sediment control programs, developing remedial action plans for areas of concern and helping landowners install needed conservation practices to protect water quality. While the Great Lakes Basin is home to some 40 million people, the impact of the Great Lakes National Program echoes throughout much of North America. To protect and enhance this important investment, conservation districts recommend funding the Great Lakes National Program at \$16 million and Great Lakes Erosion and Sediment Control at \$600,000 in fiscal year 2000.

The Clean Water State Revolving Fund (CWSRF) is a significant financial tool for achieving clean and safe water, and for helping meet the significant needs for the nation's wastewater infrastructure over the next 20 years. Conservation districts applaud the President's initiative to allow states to reserve up to 20 percent of their CWSRF for use as grants for nonpoint source pollution control and estuary management. We strongly encourage you to direct that a substantial part of the funding under a nonpoint source SRF set-aside be made available for agricultural landowners. Because of the difficulty many agricultural producers have in recouping the costs of implementing water quality management practices, loans from the SRFs have been little-utilized. However, grants to defray the costs of best management practices will be much more popular to landowners and effective in obtaining the water quality improvements we all seek. However, we oppose the President's proposal to cut funding for the CWSRF program by \$500 million. At the very least, funding for the CWSRF program should be maintained at the fiscal year 1999 level of \$1.350 billion.

In addition to EPA's water quality and other programs, the President in his budget request proposes a new undertaking called the Better America Bond (BAB) program. The BAB provides \$1.9 billion in bonding authority in fiscal year 2000 and \$9.5 billion over the next five years to help communities preserve green-space, protect water quality and redevelop brownfields. Much of the program is aimed at obtaining easements for those purposes. Conservation districts support the Better America Bond program as long as easements are obtained on a willing-seller basis.

In recent years, both the public and private sectors have recognized the valuable role wetlands play in providing both water quality benefits and valuable fish and wildlife habitat. Nonetheless, we still lose roughly 100,000 acres of wetlands annually to various types of development. Conservation districts strongly support efforts to reverse this trend and increase the inventory of wetlands nationwide. While we recognize some wetlands conversions will always be necessary, there are many innovative ways to restore lost wetlands and even create new ones. We believe that protecting and enhancing the nation's wetlands can be achieved through education and by providing landowners the technical and financial assistance they need to protect these valuable resources. The nation's conservation districts support fully funding EPA's "wetlands protection grants" program in fiscal year 2000.

We appreciate the opportunity to provide our recommendations to the Subcommittee. In addition to the above, other detailed program recommendations are outlined below.

FISCAL YEAR 2000 RECOMMENDED APPROPRIATIONS FOR SELECT PROGRAMS OF THE U.S.
ENVIRONMENTAL PROTECTION AGENCY

[Millions of dollars]

Programs	Fiscal year—				
	1999 Admin.	1999 NACD	1999 Final	2000 Admin.	2000 NACD
State Programs Grants (Sect. 106)	115.000	120.000	115.000	115.500	120.000
Nonpoint Source Pollution Control Grants to States (Sect. 319)	200.000	200.000	200.000	200.000	300.000
Water Infrastructure (CWSRFs)	1,253.000	1,350.000	1,350.000	800.000	1,350.000
Drinking Water Infrastructure	775.000	1,250.000	775.000	825.000	825.000
Great Lakes National Program	13.441	16.000	14.700	13.367	16.000
Great Lakes Erosion & Sediment Control	0.350	N/A	0.500	0.600
Gulf of Mexico Program	4.283	7.300	6.897	4.300	7.300

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF CONVENIENCE STORES AND
THE SOCIETY OF INDEPENDENT GASOLINE MARKETERS OF AMERICA

The National Association of Convenience Stores (“NACS”) and the Society of Independent Gasoline Marketers of America (“SIGMA”) submit this statement regarding the fiscal year 2000 appropriation from the Leaking Underground Storage Tank (“LUST”) Trust Fund that is part of the spending bill for the Environmental Protection Agency (“EPA”). SIGMA and NACS urge: (1) that the LUST Trust Fund statute be modified to allow the States to use some portion of the appropriations they receive under cooperative agreements with EPA for enforcement of the underground storage tank (“UST”) regulations; and (2) that the LUST Trust Fund appropriation be increased.

Introduction of SIGMA and NACS

SIGMA represents over 260 independent gasoline marketers operating in all 50 States. Last year, SIGMA members sold over \$33 billion of motor fuel, representing over 22 percent of all motor fuels sold in the United States. SIGMA members supply over 26,000 retail outlets across the nation and employ over 195,000 workers nationwide.

NACS is a trade association representing more than 2,200 retail members operating convenience stores, many with motor fuel dispensing operations, in the United States and around the world. NACS member companies operate more than 72,000 convenience stores across the nation and employ over 750,000 workers nationwide.

Background

Under EPA’s UST regulations (40 C.F.R. Part 280), all USTs that were in the ground on December 22, 1988, had to be upgraded to new tank standards, replaced with new tanks, or closed by December 22, 1998. EPA provided a 10-year compliance period largely due to the diverse nature of the regulated community and the number of USTs owned or operated by small businesses.

As the December 22, 1998 deadline approached, there were widely varying estimates of compliance rates. Based upon these estimates, EPA predicted that non-compliance on December 23, 1998 was going to be approximately 35 percent, largely from USTs owned by State and local governments and small businesses. NACS and SIGMA, based upon member-supplied information, believe that their members’ USTs are better than 96 percent compliant.

In August 1998, EPA published its post-1998 UST enforcement strategy, relying primarily on the states to be the lead UST enforcers. The Agency, in response to an inquiry from the House Commerce Committee, indicates that it has approximately 33 full-time equivalents (largely borrowed from other Office of Solid Waste programs) available for UST enforcement at the regional level. Further, the August strategy document stated that non-compliance after December 22, 1998 was not an option and that temporary closure of out-of-compliance USTs was the appropriate response.

On December 9, 1998, EPA issued supplemental guidance on its UST enforcement strategy. The Agency decided to prioritize its enforcement, essentially giving a six-month enforcement delay to “low priority” UST owners and operators—that is, State and local governments and small businesses with four or fewer USTs. SIGMA and NACS have been very critical of EPA’s December 9, 1998 guidance.

During the past two Congresses, the House has passed amendments to the LUST Trust Fund, expanding the allowable uses by the States of the Trust Fund's appropriations they receive under cooperative agreements with EPA. One of these expanded, allowable uses is enforcement of the UST regulations. EPA supported State use of LUST Trust Fund monies by the States.

Amend the LUST Trust Fund to Allow State Use for Enforcement

NACS and SIGMA urge the Subcommittee, working with the Environment and Public Works Committee, to include in the fiscal year 2000 appropriations from the LUST Trust Fund a statutory modification that allows the States to use some portion of the LUST Trust Fund monies they receive from EPA for enforcement of the UST Regulations.

There is a substantial environmental benefit from allowing State use of LUST Trust Fund monies for enforcement. Older tanks that have not been upgraded, replaced or closed are the ones most likely to leak and threaten human health and the environment. Increased enforcement will uncover sooner these non-compliant USTs, abating the potential environmental harm earlier.

State use of LUST Trust Fund monies for enforcement provides an equitable benefit to the regulated community. SIGMA and NACS support fair and even-handed UST enforcement. UST owners and operators, including NACS and SIGMA members, have spent considerable sums in complying with the tank regulations over an unprecedented 10-year compliance "window." EPA and the States also have had a decade to figure out fair and even-handed UST enforcement. It is a slap in the face to those UST owners and operators who have spent hundreds of millions of dollars in complying with EPA and State UST mandates if the law is not appropriately enforced. With few enforcers and little UST enforcement leadership by EPA, increased State enforcement sends appropriate signals to the regulated community that non-compliance with the law will not be tolerated.

At the recent House Appropriations subcommittee hearing on EPA's fiscal year 2000 spending, the Agency Administrator responded to LUST Trust Fund questions, expressing concern that stepped-up enforcement would put small businesses, especially "moms-and-pops," out of business. NACS and SIGMA believe Ms. Browner's concern is misplaced for at least three reasons.

First, in response to a question from the House Commerce Committee, EPA stated that State-supplied information suggested minimal dislocations, particularly in rural areas, if retail gasoline outlets were forced to close because of the December 22, 1998 deadline. SIGMA and NACS are not aware of any change in this information. EPA's UST regulations are not designed to protect competitors, especially when they have chosen for a decade not to comply with the law. At the same time, EPA ignores the moms-and-pops who have mortgaged their homes or their children's educations to comply with the UST regulations or who have gone out-of-business because UST upgrades or replacements were uneconomic.

Second, as part of its December 9, 1998 supplemental guidance, EPA provided an opportunity for UST owners and operators to self-disclose their UST non-compliance in return for an abatement or elimination of civil penalties. According to the Agency, fewer than 200 self-disclosures were received and most were from New York companies where EPA is the lead UST enforcer. EPA's self-disclosure policy was broadly disseminated last December. Small businesses, including moms-and-pops, had a fair opportunity to enter into reasonable consent agreement with the Agency.

Third, in a recent letter to Senator Chafee, EPA said that currently "low Priority" UST owners and operators, including moms-and-pops, will lose their enforcement status on June 22, 1998—that is, there will be no further "grace period" after this initial six months. If this truly is EPA's policy and position, then the Administrator should not be upset if the States use some of the LUST Trust Fund monies for enforcement after October 1, 1999.

Based upon the foregoing, NACS and SIGMA believe a sufficient record exists for statutory modification to the LUST Trust Fund to allow the States to use some Trust Fund monies for enforcement of the UST regulations.

LUST Trust Fund Appropriations Should Be Increased

SIGMA and NACS support increased funding over the Administration's request from the LUST Trust Fund, especially if State use of the monies for UST enforcement is approved by the Congress. Because of the December 22, 1998 compliance deadline, it is expected that there will be a "blip" in reported UST Releases and resulting cleanups. Increased funding from the LUST Trust Fund will help to ensure that the pace of corrective actions are not retarded.

At the same time, NACS and SIGMA are concerned that the LUST Trust Fund has a substantial unobligated balance which is being used to reduce the Federal def-

icit. LUST Trust Fund monies should go to the use for which the tax is levied and collected, especially when the tax often cannot be passed through in the per-gallon selling price of motor fuels.

PREPARED STATEMENT OF THE CENTER FOR THE ENGINEERED CONSERVATION OF
ENERGY AT ALFRED UNIVERSITY

Mr. Chairman and Members of the Subcommittee, I submit this statement to encourage your support for the Center for the Engineered Conservation (EnCo) at Alfred University. The mission of this Center is to validate cutting-edge environmental technology and foster the conservation of energy and environmental resources. Alfred University's record of accomplishments in these areas is well known in the research community, the private sector and with those federal agencies focused on Global Climate Change. To enhance EnCo's ability to assist with research, development and technology transfer in resource conservation, we request a \$2.5 million federal partnership grant from the Environmental Protection Agency through your fiscal year 2000 legislation to help establish the \$24.7 million Center.

EnCo was designed as a platform to develop, test and deploy environmentally-sound energy efficient technologies. It will oversee a consortial research effort involving industrial partners, state and local agencies, and the Federal Government. The EnCo Center which will function as a "living laboratory"—the facility will be used by the consortium to deploy and validate next generation building, industrial manufacturing, and transportation technologies. The living laboratory concept involves the use of a "smart," self-powered building where promising technologies can be tested and demonstrated full-scale. The laboratory will be flexible to allow it to continuously adapt emerging technologies.

EnCo will bring together a multidisciplinary group of scientists and engineers from across the University, from industry and from other universities as appropriate and will interact closely with start-up companies currently located in twin incubator facilities constructed in Corning and Alfred, NY. These incubators have established a strong record in technology transfer, and will play a critical role in bringing the products and processes developed at EnCo to the marketplace. The research and development that will be undertaken by EnCo takes advantage of Alfred University's internationally-recognized expertise in ceramic engineering and materials science and its location in the "ceramics corridor" which is comprised of industry and academic talent in these areas of research. In this way, EnCo's programs will have a very substantial influence on national energy conservation research and product development.

Given the link between energy efficiency, environmental impact, and developments in engineering and materials science, EnCo will provide numerous opportunities for interdisciplinary research in the areas of resource conservation and improved energy efficiency, the EnCo facility has been designed to meet and surpass the highest Environmental Protection Agency building codes and standards. The facility will greatly enhance technologies relating to indoor air quality while utilizing environmentally preferable materials. EnCo will also develop and incorporate into the building, cutting-edge technologies for water and wastewater usage. Further, this innovative facility will maintain low VOC content and incorporate recycled content materials into the structural framework.

Following are examples of how EnCo's research activities complement and enhance the priorities of the Environmental Protection Agency:

- Indoor Air Quality research conducted at EnCo will focus on:
 - Source control measures designed to control, reduce or eliminate harmful air contaminants that originate from the site, and from building materials, furnishings, equipment, mechanical systems and maintenance products.
 - Ventilation control measures designed to ensure that adequate, clean, outside air is delivered to inhabitants and entails the utilization of exhausting mechanisms, air filtration measures and monitoring for air contaminants.
- Environmentally-Preferable Material Selection research at EnCo will focus on:
 - Emphasis will be placed on the validation of environmentally-preferable materials which offer multiple benefits, such as reduced emissions, increased durability and environmental advantages (such as recycled content).
- Water Use research conducted at EnCo will focus on:
 - Reducing water use through low flow equipment, water efficient appliances and automatic cut-off valves.
 - Processing waste water via a Solar Aquatic wastewater treatment system couple with a constructed "wetlands" area.

- Storm water reduction through the use of advanced roofing systems, pervious paving systems and other landscape architecture systems.
- Waste Management research will take place during both the construction and operational phases of the EnCo facility, including:
 - Construction waste management designed to minimize the generation of waste material during the construction period, pre-identification of a recycling master plan for construction debris and the protection of existing trees, soils and other significant site features affected by the construction process.
 - Waste management programs deployed during the operational phase of EnCo will include the design of facility space to separate, sort and store the various waste streams (including hazardous waste) from the building and its laboratories.

The EnCo initiative will benefit significantly from the New York State Energy and Research Development Authority (NYSERDA), which—has completed a building pre-design study for EnCo focusing on the building design process NYSERDA and will provide technical assistance for consideration of whole building approaches to energy conservation, cost-sharing for building modeling and design commissioning, as well as incentives for the purchase of energy efficient equipment. NYSERDA will continue to provide design assistance related to the sustainability issues cited earlier. In addition, EnCo has been selected by NYSERDA to partner with the National Environmental Technology for Waste Prevention Institute (NETI) at the University of Massachusetts to identify “high impact” industries in the Northeast Region (New York/New England.) Close attention will be paid to cross-linkages in energy, pollution and economic characteristics and to common processes that impact on energy usage and the environment.

Through EnCo, new products can be brought to bear in the reduction of energy consumption in dramatic ways. To facilitate the introduction of these products into the marketplace, there must be a mechanism whereby the economic benefits of the products are validated by real world working experience. Private sector investments in advanced energy-efficient products and processes have a demonstrated positive economic return. What is required in order to do this is a coordinated research agenda based in a high impact, “smart building” or flexible laboratory. This research requires access to a facility which can be easily fitted with the latest technologies to test how different systems work alone or in tandem with other newly developed technologies. Effective technologies will then be transferred to our highly successful business incubators for development as products for market.

Alfred University’s accomplishments in the areas of renewable energy, energy conservation and efficiency, and its commitment to interdisciplinary research with industry and federal laboratories—all justify a strong federal partnership in the full implementation of EnCo. The institution and its non-federal partners have already committed significant resources towards the establishment of EnCo, and are now requesting that the Federal Government provide a reasonable match for this effort. The creation of the Center for the Engineered Conservation of Energy will serve as a model in the advancement of energy-efficient and environmentally sound technologies and research while producing economic benefits both regionally and nationally.

Alfred University has already invested considerable resources in the establishment of EnCo, which will cost a total of \$24.7 million to build, equip and operate. The EPA, through its Science and Technology and Environmental Programs and Management programs, is at the forefront of promoting and supporting initiatives aimed at preventing, regulating, and abating environmental pollution. EnCo has been designed to serve as a model facility that will incorporate the most advanced environmental standards and designs into its structural concept and research programs. For these reasons, and those outlined previously, I urge your consideration of Alfred’s proposal for \$2.5 million as a wise investment in our national search for ways in which to enhance our productivity and quality of life while protecting our energy and environmental resources.

Thank you.

PREPARED STATEMENT OF THE COMMITTEE FOR THE NATIONAL INSTITUTE FOR THE ENVIRONMENT

Chairman Bond, members of the Subcommittee, thank you for providing us an opportunity to present written testimony.

The Committee for the National Institute for the Environment has been working since 1989 to improve the scientific basis for environmental decisionmaking. The CNIE is nonpartisan organization that takes no position on particular environ-

mental issues other than the need for better connection between science and the decisionmaking process. We do not receive any federal money and we are not here today to seek any funding that will go to our organization.

We have submitted testimony before this Committee for several years on the need for a trusted source of scientific information on environmental issues that is separate from the regulatory agencies of the federal government. This source should provide objective peer-reviewed science that answers the key questions of decision makers and affected parties inside and outside of the government. We believe that an opportunity to create such a trusted source now exists in the context of the National Science Foundation. Our testimony today encourages the Committee to take advantage of this opportunity and to fund NSF at a level above the President's budget for the purpose of improving the scientific basis for environmental decisionmaking—a need I know you recognize.

The core principles that we advocate are:

A non-regulatory science body with a mission to improve the scientific basis for environmental decisionmaking;

Integration of:

- Assessments of the state of scientific knowledge on environmental issues
- Competitively awarded support for peer-reviewed research organized around environmental topics
- Distribution of credible non-partisan information using modern technologies, and
- Support for science-based environmental education and training.

Involvement of all stakeholders in its activities equally, inside and outside the federal government.

THE NEED FOR A TRUSTED SOURCE OF SCIENTIFIC INFORMATION ON THE ENVIRONMENTAL ISSUES

No one seeks to perpetuate environmental problems that threaten our health, economy, and quality of life. Yet, we are often in a situation of making decisions without a strong scientific understanding of the issues. The impacts of those decisions can be very costly in terms of money spent without accomplishing real progress or in lives that are adversely affected by real problems that go unaddressed. Without sufficient investment in science, decision makers often lack the reliable information they need to make informed choices.

Much of the environmental research supported by the federal government is conducted by regulatory or management agencies on short-term topics of direct importance to the agency. Because these agencies often act as an environmental police force, they and their science is viewed by many with mistrust or seen as tainted with a political agenda. This is not a criticism of regulatory and resource management agencies, simply an observation of an avoidable consequence of their missions.

On the other-hand non-regulatory agencies like the National Science Foundation have a great deal of public trust and support. In the case of the National Science Foundation this trust and support is well deserved. The science supported by the non-regulatory Foundation have served this nation so well that we might well call it the National "Success" Foundation.

Yet, many of the most important and controversial environmental issues such as urban air quality, potential effects of endocrine disrupters, ecological relationships related to collapsing fisheries stocks and possible relationships between ethnicity and exposure to toxicants are poorly addressed by the federal science agencies. They are tackled first within regulatory agendas and later, if at all, within science agendas. They become embroiled in controversy and make lawyers rich. This needs to change.

The National Science Foundation is beginning to recognize that it has a role to provide the science to understand, resolve, and even prevent these environmental problems. Spurred, in part by the interest of this Committee as well as by our efforts, the NSF is beginning to recognize that this new role can be taken on in a way that complements its traditional role as the nation's source of fundamental science, but that it will take some institutional changes as well as additional funding to fulfill both its traditional role and this new role as a leading provider of science to improve environmental decisionmaking.

SUPPORT FOR THE NIE INITIATIVE

Our effort to create a source of credible scientific information on the environment has been developed in partnership and has been endorsed by more than 440 organizations, including:

- State and local government groups such as the National Association of Counties, U.S. Conference of Mayors, Council of State Governments, National Association of Attorneys General and National Conference of State Legislatures,
- Most national and many local environmental groups,
- The U.S. Chamber of Commerce and more than 30 state and local chambers of commerce and business associations,
- 255 colleges and universities,
- 85 scientific societies,
- Three former administrators of the Environmental Protection Agency and six of seven former EPA Directors of Research and Development.

Our Board of Directors reflects this diverse support; I am one of three elected state and local governmental officials on the CNIE Board. As an environmental engineer and as the recently retired Majority Leader of the Utah State Senate, I have seen far too many examples of legislators and administrators needing to make a decision when the science was not sufficient. Many decisions can not and should not be deferred, but we also need a process to ensure the adequacy, quality and the independence of the science that we need. This nation needs to increase its investment in environmental science and engineering. However, it needs to do it in a way that involves decision makers and other stakeholders in helping scientists and engineers to determine priorities. The proposal to implement the principles of a National Institute for the Environment under the National Science Foundation offers this opportunity.

THIS COMMITTEE'S SUPPORT FOR THE NIE INITIATIVE

We greatly appreciate the past support of your committee for the proposal is known as the National Institute for the Environment or the NIE. As part of the House-Senate Conference Report 105-297 to accompany the fiscal year 1998 appropriation to the National Science Foundation, you stated, "Finally, the conferees encourage the National Science Foundation to study how it would establish and operate a National Institute for the Environment."

RESPONSE OF THE NATIONAL SCIENCE FOUNDATION

Last April, the National Science Foundation reported to this Committee that it was "committed to environmental research and education in all areas of science and engineering, and is eager to expand its role in a manner consistent with overall national goals and with its mission and strategic plan." But the NSF did not have a plan of action at that time.

Last summer, the National Science Board (NSB) created a Task Force on the Environment "for the purpose of assisting NSF in defining the scope of its role in environmental research, education, and assessment, and in determining the best means of implementing activities related to this area." The findings of the Task Force will be presented to the NSB at its meeting on May 7, 1999.

Although we are not aware of the details of the Task Force report, we are very encouraged by the workings of the Task Force. We have been given considerable opportunity to work with the Task Force and have been impressed by its significant efforts to go beyond the status quo and provide genuine leadership for the nation on this issue. We understand that they will propose an ambitious initiative for NSF, which we hope will be consistent with the NIE principles and goals that we have outlined previously.

The Task Force plan seems likely to provide mechanisms for making environmental science supported by the NSF more relevant and helpful to the nation's need for more scientific environmental decisionmaking. This is something that this Committee and Congress has urged for a long time. I hope that we can all look at the NSF plan as a real victory. However, the greatest plan will come to naught if this Committee does not provide support—both intellectual and funding.

In addition to the work of the Foundation's Task Force on Environment, new NSF Director Rita Colwell, is making science for understanding the environment one of her top priorities. The NSF budget request for fiscal year 2000 includes a new \$50 million initiative for integrated environmental science, under the theme "biocomplexity"—a term coined by Dr. Colwell to describe the complex interrelationships between living beings and the environmental systems in which they live. This would boost NSF's environmental portfolio to \$670 million, with the vast majority being managed through NSF's disciplinary directorates.

Today, we wish to make the following points:

- Congress should take advantage of this excellent opportunity to place environmental decisionmaking on a more scientific basis by giving a clear sign of its support for the NSF's efforts to connect its environmental science funding to the

decisionmaking needs of the nation. We encourage this Subcommittee to give the same kind of priority to NSF that the subcommittee of jurisdiction has given to the National Institutes of Health. Investment in environmental science is essential to the health of our citizens and our economic strength. Only by investing in a new approach to science will we be able to achieve one without compromising the other.

- We encourage the Committee to fully fund the NSF's biocomplexity and environmental initiatives.
- We encourage the Committee to add additional funding above President's request for NSF to implement the principles of a National Institute for the Environment through the Foundation. We support the proposal of the Coalition for National Science Funding (CNSF), of which we are a member, for a \$562 million, 15 percent increase over fiscal year 1999 funding for NSF. This would help to maintain America's preeminence in science upon which so much of our economic well being depends. Such a level of funding would also allow the Foundation to take immediate steps to implement the principles of the NIE without adversely impacting other scientific endeavors.
- We recommend that in the context of providing funding over the President's request, that this Committee give special attention to an increase in environmental science funding to implement the recommendations of the Task Force, consistent with the principles of the NIE. Since we do not yet know the details of these recommendations, we would like to keep the option open of coming back to this Committee with suggestions for ensuring that NSF's proposal is consistent with the desires of this Committee as expressed in the fiscal year 1998 report language.

I, the Board and the staff of the CNIE, and the many supporters of this effort are ready to meet with Subcommittee members and their staff to provide further details and work with you to accomplish a goal that I know we all share—improving the scientific basis for making decisions on environmental issues.

Again, we thank this Committee for its commitment to ensuring scientific excellence with respect to environmental decisionmaking and for its time and consideration.

PREPARED STATEMENT OF THE LOVELACE RESPIRATORY RESEARCH INSTITUTE

It is requested that the U.S. Environmental Protection Agency (EPA) continue to support the National Environmental Respiratory Center for the purpose of conducting research, providing information and research resources, and facilitating interdisciplinary communication concerning the respiratory health risks of combined exposures to multiple air pollutants and pollutant mixtures. Funds for continuation of the Center are requested in the fiscal year 2000 EPA appropriation.

WHAT IS THE NATIONAL ENVIRONMENTAL RESPIRATORY CENTER?

The National Environmental Respiratory Center (NERC) was established through the fiscal year 1998 EPA appropriation to improve our understanding of the relationship between complex mixtures of environmental (outdoor) air pollutants and human health. Continuation funding was provided in the fiscal year 1999 EPA appropriation. The Center is operated by the independent, non-profit Lovelace Respiratory Research Institute (LRRI) in Albuquerque, New Mexico, and its research is conducted in the government-owned, now privatized, Inhalation Toxicology Research Institute facility, which is leased by Lovelace. The Center's principal activity is the conduct of research aimed at understanding the contributions of the many individual pollution mixture constituents to the respiratory health effects of real-world, complex pollutant mixtures. The Center's work is leveraged by making its unique studies and associated research resources available to investigators in other organizations for collaborations. The Center also maintains an internet site containing information on the Centers activities, bibliographic databases, and other information pertaining to air pollution mixtures issues and the mixtures currently under study.

WHY WAS THE CENTER ESTABLISHED?

Environmental air pollution research and regulations have focused largely on single pollutants and sources, one at a time, in a "revolving door" manner. People do

not breathe only one pollutant, or pollutants from only one source, at a time. Congress, researchers, regulators, industry, and the public are increasingly aware that the "single pollutant" approach has reached the point of diminishing returns. Paradoxically, as levels of regulated pollutants fall due to existing controls, the uncertainty EPA faces in estimating and controlling the remaining health effects of environmental air pollution is growing. As exemplified by the current quandary concerning particulate matter, it is becoming increasingly difficult to assign causality to single pollutants or pollutant classes independent of the effects of co-pollutants. The nation faces a difficult dilemma in judging whether or not health impacts are attributed to the correct air contaminants, or combinations of contaminants, and the appropriateness and cost-effectiveness of further reductions in specific man-made pollutant emissions. Until NERC was established, there was no substantive, coherent research program aimed specifically at developing a foundation of information that could serve as a basis for considering alternate approaches to understanding and managing the relationship between air quality and health. NERC was created to complement other efforts by meeting key unmet research needs critical to placing the contributions of individual air contaminants in their proper perspective.

NERC is one of two current initiatives directly exploring the roles of the myriad pollutant species in the health effects of the mixtures which people actually breathe. The expansion of EPA's air monitoring program driven by concerns for fine particulate matter (PM_{2.5}) includes establishing a limited number of "super sites" which will provide research-grade data on both particles and co-pollutants. This information will provide much more detail on the types and amounts of the various particles, vapors, and gases to which populations are exposed. The intent is that new population studies will be conducted in the vicinity of the super sites to take advantage of the more detailed air pollution data. Although this will provide important new information, it will still be difficult to assess (and impossible to control) the personal exposures of specific individuals. Also, the measurements that can be made in population studies can not provide the level of detailed information on health responses that can be obtained in laboratory studies. NERC provides key components of the complementary laboratory effort that are not provided by any other center or research program.

WHAT DOES THE CENTER DO?

The operating strategy for NERC and the specific research being conducted were recommended by the Center's External Scientific Advisory Committee (ESAC). The members of this broad-based Committee have diverse backgrounds and views, and are both veterans and experts in the air pollution research, regulatory, compliance, and advocacy arenas. LRRRI has vested a large measure of the responsibility for developing the Center's agenda in this Committee.

EXTERNAL SCIENTIFIC ADVISORY COMMITTEE

Morton Lippmann, PhD, Chair, New York University
Jonathan Samet, MD, MS, Johns Hopkins University
Michael Bird, MSc, PhD, DABT, C.Chem, FRSC, Exxon Biomedical Sciences, Inc.
John Vandenberg, PhD, U.S. Environmental Protection Agency
Bill Bunn, MD, JD, MPH, Navistar
Ron White, MST, American Lung Association
Glen Cass, PhD, California Institute of Technology
Ron Wyzga, MS, ScD, Electric Power Research Institute

The center's research program

The NERC research strategy is focused on conducting a multi-year series of integrated studies planned in advance with the aim of filling specific information gaps. This strategy differs from the common research center approach of providing core resources and conducting an annual internal competition for investigator-initiated studies. The more structured strategy recommended by the Center's External Scientific Advisory Committee allows the resources provided by multiple sponsors to be focused in a goal-directed manner to resolve key portions of the very complex issues surrounding the health effects of pollution mixtures.

The initial multi-year set of studies will employ a consistent set of respiratory health assays to determine the effects of several complex, real-world, man-made air pollution mixtures. The exposure atmospheres were selected so that their similarities and differences can be used as tools to determine the roles of individual constituents, families of constituents, and combinations of constituents in driving the various health effects of the total mixture. As shown in the table below, the 11 mixtures will include diesel (old and new technology) and gasoline (on-road catalyst and

off-road non-catalyst) engine exhaust, wood smoke (hardwood and softwood), cooking fumes (meat and vegetable), tobacco smoke, paved road dust, and coal-fired power plant emissions. These atmospheres will be analyzed in much greater detail than has been typical of toxicology studies, in order to relate health responses to their hundreds of individual constituents and dozens of classes of constituents.

Laboratory health response assays comprising five general categories of respiratory effects will be evaluated for each atmosphere, including irritation/inflammation, allergic responses/asthma, respiratory defenses, lung and heart function, and cancer. Several different laboratory health models and assays will be used to encompass these effects which, in turn, encompass the key types of health responses attributed to environmental air pollution.

INITIAL MULTI-YEAR RESEARCH MATRIX

	Irritation and inflammation	Allergies and asthma	Defenses	Heart and Lung Function	Cancer
Diesel exhaust (old, new)	+	+	+	+	+
Gasoline exh. (catalyst, non-cat.)	+	+	+	+	+
Paved road dust	+	+	+	+	+
Wood smoke (hardwood, soft)	+	+	+	+	+
Tobacco smoke	+	+	+	+	+
Cooking fumes (veg., meat)	+	+	+	+	+
Coal power plant (secondary)	+	+	+	+	+

The matrix of data on health response vs. atmosphere composition across the different pollution atmospheres will have considerable value of three general types. First, and most importantly, the data will allow taking advantage of the similarities and differences among the compositions of the atmospheres to determine the individual constituents, classes of constituents, and combinations of different constituents that bear the strongest association with the different health outcomes. This is the fundamental goal of the Center.

Second, an integrated, contemporary set of health data will be generated for each atmosphere. For some of the atmospheres, no such data exist, and for others, no data using contemporary assays exist. Third, generating the data using identical study designs will provide direct, head-to-head inter-comparisons among the man-made pollutant atmospheres, which current data do not provide.

This initial series of studies will provide a foundation of information on which studies of the causal roles of other air contaminants can be designed. There are innumerable atmospheric reaction products, pollens, molds, endotoxins, infectious agents and other natural and man-made environmental air contaminants whose potential effects, or interactions with other pollutants, need to be understood and placed in context. In addition, there are many possible adverse interactions between environmental air pollutants and other exposures in the workplace and home that may contribute to the health effects associated with outdoor air pollution. As results from the initial series of studies are obtained and evaluated, issues to be addressed by following research will be identified and prioritized.

Other center functions

An explicit goal of the Center is to leverage its resources to serve broadly as a research resource to university investigators. Collaborative participation in Center research is encouraged and facilitated. NERC resources are made available to other investigators for the conduct of complementary studies in a cost-effective manner on a non-interference basis. This way, many hypotheses can be tested in addition to those addressed directly by Center investigators. Special emphasis is placed on providing collaborative opportunities to EPA intramural scientists to complement the Agency's in-house capabilities and studies. It is expected that NERC will also provide many collaborative opportunities and information resources to the newly-established EPA academic particle research centers; indeed, NERC scientists were asked to participate in collaborative and advisory roles by three of the five successful center applicants.

The development of an internet-based resource of information relevant to Center activities and air pollution mixtures issues is an important component of the Center's strategy. This resource is accessed via the Center's web site (www.nercenter.org), and consists of information on the goals and activities of the Center, opportunities for collaboration and other research resources, and biblio-

graphic databases on the composition and health effects of the pollutant mixtures used in Center studies.

WHAT ARE THE CENTER'S ACCOMPLISHMENTS TO DATE AND CURRENT STATUS?

Accomplishments during fiscal year 1998 included: (1) establishing the external advisory committee; (2) submitting an application to EPA; (3) internal and external review of the application by EPA and approval of the Center as proposed; (4) meeting with the committee and developing the Center's strategy; selection by the committee and initiation of five pilot projects necessary to finalize design of the core research protocols; (5) developing budgets for the first and second years; (6) submitting a detailed work plan to EPA; (7) contacting and briefing a wide range of non-EPA federal, state, and non-government potential sponsors; and (8) establishing the internet site and beginning work on the information database.

With funding in the fiscal year 1999 EPA appropriation, work on five pilot studies is well underway. These projects address issues of current concern and are thus valuable as individual studies, but they are also producing information on experimental techniques that will be useful for designing the protocols for the core Center research program. The studies are examining: (1) airway and lung irritation from wood smoke; (2) the role of fine particles in the development of asthma; (3) toxic interactions between ozone and fine particles; (4) the effects of particle-borne metals on the heart; and (5) the development of statistical approaches to estimating risks from multiple pollutants.

The Center's internet site has already been developed into a considerable resource. Approximately 22,000 citations from the scientific literature, Federal Register, and technical reports have been entered into the information database. Several other research organizations have been briefed on collaborative opportunities.

A major task to be completed by the end of CY 1999 will be planning the details of the experimental design for the core research. This is being done together with external experts. Workshops are being organized in which Lovelace scientists and external scientists and technical experts will discuss alternatives and resolve many of the details of the core research protocols, including the generation of atmospheres, analyses of the atmospheres, exposure concentrations, health assays, statistical design, etc.

WHAT SUPPORT IS BEING SOUGHT FOR THE CENTER?

The funds appropriated for fiscal year 1998 and 1999 are spent or committed for ongoing work. A preliminary multi-year budget has been developed for the work recommended by the External Scientific Committee, and the results indicate that approximately \$24 million over a six-year period will be required to accomplish the Center's work plan for the initial matrix of studies and analysis of the results. Thus, the planned activity will require approximately twice the level of annual funding provided in the EPA appropriations for fiscal years 1998-1999.

A strong effort is underway to obtain non-EPA funds for the Center. Since the Center's long-term strategy was developed nine months ago, significant discussions (multiple telephone conversations, transmittal of written materials, scheduling of briefings) have been held with a continuously-expanding list of organizations. To date, 58 companies, trade associations, and state and federal agencies concerning their potential support of the Center.

Although non-EPA financial support is beginning to develop, it is too early to estimate the level of non-federal funding that is likely to be raised. Recommendations have been made internally within numerous organizations in several industry sectors, and five organizations have already made contributions.

Lovelace respectfully requests that a minimum of \$2 million be designated for the NERC in the fiscal year 2000 EPA appropriation, to be used as core support for the Center's third year of operation. This funding is essential to ensure continuation of the Center and maintenance of its progress while complementary support from other stakeholders is developed and EPA considers incorporation of the Center as an integral component of its air pollution research portfolio.

PREPARED STATEMENT OF THE CENTER FOR COGNITION, LEARNING, EMOTION, AND MEMORY AT NEW YORK UNIVERSITY

Thank you, Mr. Chairman. My name is Peter Lennie, and I am speaking on behalf of New York University as its Dean for Science. I appreciate the opportunity to submit testimony to the Subcommittee today to discuss a scientific research project which is not only an important priority for New York University, but which we be-

lieve will advance the national interest through enhanced scientific understanding of brain function and development.

Our project addresses the programmatic priorities of this subcommittee in supporting fundamental, university-based scientific research and enlisting that research to serve the national welfare. We thank the Subcommittee for taking the time to consider and give its support to the important research being conducted in the brain sciences—an area of great strength at New York University. We are proud to report that New York University was previously approved for funding by the Environmental Protection Agency (1992), and that its performance in using the funds to strengthen the infrastructure for neural science was reviewed highly. EPA funds were used to renovate training and research facilities, modernize mechanical infrastructure systems, and purchase multi-use equipment, thereby accelerating scientific advances and new applications and preparing the next generation of scientists. We at NYU firmly believe that a federal investment in mind and brain studies repays itself many times over.

In line with the Subcommittee's interests, New York University is undertaking to establish a Center for Cognition, Learning, Emotion and Memory (CLEM). This Center will draw on the University's strengths in the fields of neural science, biology, chemistry, psychology, computer science, and linguistics to push the frontiers of our understanding of how the brain develops, functions and malfunctions. In addition, as a major training institute, the Center will help prepare the next generation of interdisciplinary brain scientists.

A major thrust of the work to be carried out in the Center is research on the learning process, including the underlying cognitive processes that affect attention, memory, information processing, skills acquisition, and retention, as well as their implications for strategies that can rationalize and optimize training, learning and performance. Of special interest to those studying learning and memory systems is neural "plasticity," the change in the nervous system that occurs when we remember new things or learn new skills. Understanding neural plasticity is essential to understanding and improving the flexibility of human behavior. The fundamental biomedical and behavioral research in this area will advance basic science and have important practical implications in many sectors, including education, job training, and technology development.

To establish this Center, New York University is seeking \$10.5 million over five years to support and expand the research programs of existing faculty, attract additional faculty and graduate and postgraduate trainees, and provide the technical resources and personnel support that will allow us to create a premier, world class scientific enterprise. Individual researchers in the science programs at NYU compete for investigational support through traditional routes, very successfully. However, these traditional funding sources do not address the specific need for establishment of a new cross-disciplinary area of scientific study, particularly one that transcends biomedicine, psychology, education, computer science, cognitive science, and linguistics. Nor do they provide the extensive funding necessary for faculty and student support and personnel and technical resources. Support from the Subcommittee on VA-HUD and Independent Agencies would enable us to meet these needs, and to build on the potential New York University has to develop a new understanding of the brain and new ways of using that knowledge for improving the national welfare.

RESEARCH ADVANCES AND APPLICATIONS

Advances in Biomedical Research.—Research conducted in our Center will by its nature address neural disorders, including disorders of emotional systems and the loss of memory through aging or disease. At NYU, pioneering research into the neurobiology of fear is generating important information about the brain systems that malfunction in, for example, anxiety, phobias, panic attacks, and post-traumatic stress disorders. The brain's fear system is involved in many human emotional disorders, and malfunctions in emotional systems commonly characterize serious psychiatric disorders. Research into the neural mechanisms of fear will help us understand the source of emotions, how they are triggered by circumstance, why these emotional conditions are so hard to control, and how they can undermine our capacity to learn. Ultimately, our research will generate clues for prevention and treatment of emotional disorders, focusing perhaps on the ways in which unconscious neural circuitry can, in effect, be altered or inhibited.

Job Training.—Research into the fundamental processes of cognition and learning, emotion and memory will help address the persisting challenge the nation faces in training veterans and other new recruits to the labor force and in retraining workers dislocated from downsized industries. Understanding how the brain func-

tions and how we learn is crucial to vocational rehabilitation, a primary concern for veterans. The more we know about how people acquire, process, and retain information, the better training programs can be designed and targeted for specific skills and for workers with diverse backgrounds. For example, CLEM research can clarify how adult learners use different learning styles, how training personnel can accommodate those styles, and how educational technology and simulated learning environments can be harnessed to improve motivation and increase retention.

Education.—Research into the learning process as it relates to attention and retention holds important implications for early childhood development. Understanding how, when and under what conditions learning proceeds can have practical applications for parents, caregivers and educators. In the midst of a national debate on education reform, thousands of educational innovations are being considered without the advantage of a fundamental understanding of the learning process. CLEM researchers, coupled with educational psychologists and their expertise in normal childhood development, can contribute substantially to national efforts to enhance early childhood education, and improve teaching and learning in elementary and secondary schools. At NYU, one locus for the development of these practical applications is the Center for Digital Multimedia (a New York State Center for Advanced Technology). The Center brings together teaching experts, laboratory scientists, and software designers to explore how interactive multimedia technologies enhance training, develop prototype teaching models, and facilitate computer-human communication through graphics, speech and vision.

Technology.—The fundamental research being conducted at NYU in learning, intelligence, and information processing in biological systems can contribute significant new understanding of computer and communication technologies for the future. Research at the interface between computer science, vision science, and learning research builds on the recognition that vision impacts all areas of cognition, and that computer vision studies the processing of images and thus, in its own way, addresses cognitive issues. At NYU, vision psychologists and computer vision researchers are working together to investigate the neural bases of object and pattern recognition, depth perception, and motion perception, and their computer analogs in data imaging, processing, and retrieval.

Environment.—Improved understanding of the structure, function, and development of the nervous system is the first link in the chain leading from scientific discovery to a better understanding of human health to effective regulatory and management actions in the realm of environmental protection. At NYU, research into neural development and function can help to explain how environmental factors alter or influence these processes.

FEASIBILITY: INSTITUTIONAL STRENGTHS

New York University is well positioned to create and operate a major multidisciplinary research and training center. There is commitment to the CLEM project at the highest level of the University administration, established frameworks for interdisciplinary collaboration, strengths in neurobiological, psychological and computational sciences, and international standing in the scientific community. The nation's largest private university, with 13 schools and over 49,000 students, NYU is a leading center of scholarship, teaching and research. It is one of 29 private institutions constituting the distinguished Association of American Universities, and is consistently among the top U.S. universities in funds received from foundations and federal sources.

As the core of a decade-long multi-million dollar science development plan, NYU created a premier neuroscience and cognitive psychology program that encompasses a pre-eminent faculty and generates substantial external funding from federal and state agencies as well as the private sector. These investigations have attracted millions of federal dollars from the NIH, the NSF and the EPA. In addition, NYU has received major funding from the most prestigious private foundations supporting the sciences. This includes the Howard Hughes Medical Institute (HHMI)—the foundation most active in support of the life sciences. (NYU is now home to no fewer than six HHMI Investigators, with corresponding funding from the Institute.) The HHMI also has awarded NYU two major grants, each exceeding \$1 million, from its Undergraduate Biological Science Initiative Program, as well as a major facility improvement grant. The W. M. Keck Foundation also awarded two grants, each exceeding \$1 million, for facility and program development in the neural and cognitive sciences; one grant funded the renovation of a major new laboratory in emotional memory studies. The Alfred M. Sloan Foundation similarly awarded two major grants totaling \$2 million to found the Sloan Center for Theoretical Visual Neuroscience—one of five institutions chosen to implement the Foundation's national ini-

tiative in theoretical neurobiology. Neural science faculty have, as individuals, won prestigious awards, including HHMI Investigator, NSF Presidential Faculty Fellow, NIH Merit Awardee, McKnight Foundation Scholar in Neuroscience, and MacArthur "Genius" Fellow.

Neural science at NYU is particularly well known for its fundamental studies of neural systems, particularly vision (including studies of visual processing pathways, perception, and information processing) and audition (including studies of auditory regions of the nervous system). These various studies of mind and brain employ a full range of techniques; they coordinate anatomical, neurophysiological, biochemical, and behavioral experiments; and they are conducted in various model systems up through humans, and computer modeling and simulations.

With these strengths, NYU is particularly well placed to create a distinctive center that will capitalize on expertise in physiology, neuroanatomy, and behavioral studies and build on active studies that range from the molecular foundations of development and learning to the mental coding and representations of memory.

While other academic institutions are also studying the brain, NYU has special strengths in important emerging research directions. NYU is at the frontier of studies in the neuroanatomy and physiology of emotion, a new area of exploration that complements studies of how thoughts, and memories emerge from brain processes. Work recently conducted at NYU and elsewhere has established the biological basis of emotions and the patterns by which they are expressed within the neural circuits of the brain and by the actions of the body. The new studies have found that there are multiple systems in the brain, each having evolved for different functional purposes, and each producing different emotions. Work being conducted at NYU also suggests that the neural circuits supporting the expression of emotions are highly conserved through evolution. They persist, unconsciously, in our daily behavior, and shape our reactions to events well before we rationally and consciously process the event. Scientists at NYU are using behavioral testing, physiological recording of neural activity, and neuroanatomical tract tracing to ask, what are the neuroanatomical pathways for the formation of emotions and emotional memories? How do we learn and remember emotions? These studies have crucial applications for personnel training, job performance and mental health, and address such questions as: How can emotions, such as fear, facilitate or undermine learning and performance? Do emotionally stressful situations affect our ability to remember facts, retrieve information, perceive events and objects? How can we better diagnose and treat emotional disorders?

In a second area, NYU is internationally known for its vision studies. At NYU, these follow an integrated systems approach that has been shown to be highly successful in unraveling this complex system. The interest in vision, a key input to learning, is associated with focused studies of the learning process, particularly, the interaction with memory and behavior. NYU vision scientists are studying form, color and depth perception; visual identification; the varieties of visual memory; and the relationship of vision and perception to decision and action. Studies ask: How does vision develop? How does the brain encode and analyze visual scenes? What are the neural mechanisms that lead to the visual perception of objects and patterns? How do we perceive spaces, depth, and color? How does the brain move from vision and perception to planning and action?

NYU's special strengths also lie in the infrastructure it has established to promote multidisciplinary brain research that incorporates experimental, theoretical, and computational components. As an example, the Sloan Center for Theoretical Visual Neuroscience fosters joint research that harnesses the tremendous recent advances in computational speed, size and memory to effectively revolutionize the power of quantitative analysis to address fundamental problems in neurobiological systems. The Center houses faculty with joint appointments in neural science (Arts and Science) and mathematics (Courant Institute of Mathematical Sciences), supports neural science trainees with backgrounds in the physical and mathematical sciences, and fosters a range of multidisciplinary projects which include: analysis of neural and network dynamics of the visual cortex; the nonlinear dynamics of the thalamus and other neural structures; analysis of the visual perception of occluding objects; brain imaging and adult brain plasticity.

CLEM will bring the University's many strengths in these areas more fully to bear on the challenges and opportunities that multidisciplinary studies present. The Center will provide an organizational identity, core resources, and common focus for the university's efforts. For students, it will provide an educational forum to apply knowledge gained in one discipline to problems in other disciplines. For researchers, the Center's synergistic linkages between basic science departments, mathematical and computational units, and biomedical departments will encourage intellectual cross fertilization and will permit the consolidation of individual efforts in multi-

disciplinary but conceptually coordinated efforts. For colleagues in the fields of technology, education, and medicine, the Center will facilitate connections with life scientists and enhance the translation of research knowledge into commercial and educational applications and health care.

CLEM will be an interdisciplinary unit linking faculty, students, programs and resources from several schools of New York University. These are the Faculty of Arts and Science, the Courant Institute, School of Education, and School of Medicine, including its Skirball Institute of Biomolecular Medicine and the associated Kline Institute Center for Advanced Brain Imaging. To be housed at the University's Washington Square campus within the Faculty of Arts and Science, CLEM will coordinate laboratory research and training in fundamental neurobiological, psychological, and computational studies of the nervous system. The enhanced research and training that will be possible will attract public and private funding above and beyond the substantial funds, honors and recognition already awarded to the University's researchers, and will support the center's continued growth and development.

Mr. Chairman, I thank you for the opportunity to submit this testimony.

PREPARED STATEMENT OF THE INTEGRATED PETROLEUM ENVIRONMENTAL
CONSORTIUM (IPEC)

It is proposed that the U.S. Environmental Protection Agency continue to support a focused, university-based program, the Integrated Petroleum Environmental Consortium (IPEC), with the goal of increasing the competitiveness of the domestic petroleum industry through a reduction in the cost of compliance with U.S. environmental regulations. Continued Federal support of \$2 million is specifically requested as part of the fiscal year 2000 appropriation for the Environmental Protection Agency through the Science and Technology account or other source the Subcommittee may determine to be appropriate.

Mr. Chairman, on behalf of the Integrated Petroleum Environmental Consortium (IPEC), I would like to take this opportunity to thank you for providing \$1.5 million in funding for IPEC in the fiscal year 1998 and fiscal year 1999 appropriations bills for the Environmental Protection Agency (EPA). Under your leadership both houses of Congress and the final appropriations bills included initial funding for this Consortium. Specifically this funding was provided for the development of cost-effective environmental technology and technology transfer for the domestic petroleum industry. With initial funding under the Science and Technology account of EPA, IPEC is implementing a comprehensive mechanism (Center) to advance the consortium's research expertise in environmental technology. IPEC's operating practices and linkages to the independent sector are ensuring that real problems in the domestic petroleum industry are addressed with real, workable solutions. The consortium includes the University of Tulsa, the University of Oklahoma, Oklahoma State University, and the University of Arkansas.

We are pleased to report that, as envisioned and proposed by the Consortium, State-level matching funds have been obtained to support IPEC, creating a true Federal-State partnership in this critical area. In fiscal year 1998 and fiscal year 1999, IPEC received \$375,000 in matching funds from the Oklahoma State Regents for Higher Education. A similar amount has been pledged by the Regents as matching funds for a fiscal year 2000 appropriation.

Since December, 1997 IPEC has worked closely with the EPA to meet all internal requirements for funding of research centers. These efforts have resulted in an excellent working relationship with the Environmental Engineering Division of the EPA National Center for Environmental Research and Quality Assurance with IPEC's grant from EPA (fiscal year 1998 appropriation) finalized September 2, 1998.

IPEC proceeded with its proposal solicitation and review process while final arrangements were made with the EPA. As a result we were ready to fund projects as soon as the grant was made. I am happy to report that IPEC has thus far funded eight research projects that promise to help ease the regulatory burden on the domestic petroleum industry. These funded projects include: the use of plants to clean contaminated soils; the natural biodegradation of gasoline by microorganisms in the absence of oxygen; the beneficial use of petroleum wastes as road materials; the control of the formation of toxic hydrogen sulfide in oil wells; the development of simple sampling devices to replace expensive live organisms to assess toxicity in contaminated soils; the treatment and disposal of naturally occurring radioactive material (NORM) in oil production equipment; and the remediation of brine-impacted soils. These projects were first reviewed and approved by our industrial advisory board (dominated by independent producers) as relevant to our mission of increasing the

competitiveness of the domestic petroleum industry and finally reviewed and approved by our science advisory committee on the basis of scientific quality.

IPEC has provided \$761,685 in funding for these projects. However, another \$631,480 in funding for these projects have been secured by the investigators as matching funds from industry and industry organizations such as the Gas Research Institute, the American Petroleum Institute and the Petroleum Environmental Research Forum. This is over and above the matching funds provided by the Oklahoma State Regents for Higher Education. IPEC has pledged to Congress to work for a 1:1 match of federal dollars. As you can see IPEC is living up to that promise! IPEC is well on its way to becoming a true public/private partnership.

THE CONTINUING CRISIS IN THE DOMESTIC PETROLEUM INDUSTRY

The crisis in the domestic petroleum industry that we described in testimony in the last session of Congress has only gotten worse as the price of crude oil continues to fall. The independent producers are producing from mature fields left behind by the majors. Although there is a significant resource base in these fields, this is the most difficult and the most costly oil to produce. The independent producer has only one source of revenue—the sale of oil and gas. There is no vertical depth to his business. With the price of oil this low the independent producer is extremely vulnerable to the costs of environmental compliance. This latest drop in oil prices will no doubt result in another wave of business closures, plugged and abandoned wells, and reduced new-well completions. The problem is so acute that the Governor of Oklahoma formed an emergency task force to determine what the state can do to help Oklahoma producers survive the current decline in prices. Based on recommendations from this task force the Oklahoma legislature passed new legislation in a special session to link the gross production tax to the price of oil. However, legislators and independent producers alike know that this measure only delays the inevitable if the price of oil remains depressed at current levels. A similar price crash in the 1980s triggered a prolonged statewide recession. Clearly this trend is not in the best interest of the U.S. in terms of energy self-sufficiency or national security. We are turning over control of our cost of production, in terms of energy costs, to foreign interests. If domestic exploration and production and refining are to continue to play a strategic role in meeting U.S. energy needs, the domestic petroleum producer will continue to require access to cost-effective technology for pollution prevention, waste treatment and remediation in exploration and production (E&P) and refining.

IPEC'S RESPONSE TO CRITICAL RESEARCH NEEDS

IPEC is well on its way to fulfilling its pledge to you of responsiveness to the needs of domestic petroleum industry and fiscal responsibility. IPEC is continually probing our industrial advisory board for new ways to assist the industry and continually seeking out cost-effective technical solutions to these problems through an aggressive solicitation and review process. With the current price of oil these solutions are all the more critical.

IPEC will continue to work with the domestic petroleum industry to provide solutions to those environmental problems that represent the greatest challenge to the competitiveness of the industry. Specifically in fiscal year 2000 IPEC will continue to work with our Industrial Advisory Board to address the remaining critical research needs they have identified as well as address new needs that develop. These research needs include the following:

(1) *Bioremediation and other remediation technologies.*—reducing toxicity of hydrocarbon-contaminated soils; development of rapid, on-site remediation technologies; control of salt migration in the subsurface; developing methodologies for phytoremediation.

(2) *Risk Assessment.*—development of cost-effective ecological risk assessment methods for petroleum impacted sites; development of cost-effective and relevant terrestrial (animal/plant) bioassays for use in ecological risk/impact assessment; development of field methods for ecological risk assessment; development of methods to evaluate actual and future environmental risk of petroleum impacted soils; determining the correlation between ecological risk assessment and human health risk assessment; determining the impact of intrinsic bioremediation on risk-based closures; development of risk-based guidelines for handling, disposal and storage of NORM-contaminated solids, pipe, and equipment.

(3) *Measurement Technology.*—development of cost-effective methods (direct and indirect) for measuring the amount and extent of petroleum hydrocarbon sources in unsaturated and saturated soils; development of useful and easy to implement field and analytical methods and protocols for demonstrating intrinsic bioremediation;

validating current models for predicting flash emissions of hydrocarbons in E&P operations.

(4) *Process Technologies*.—control or treatment of flash gas emissions from stock tanks; use, treatment or disposal of oil tank bottoms; development of cost-effective methods for capture, recycling/destruction of volatile organic compound emissions from hydrocarbon processing and storage tanks; development of improved water treatment methods—particularly those methods; development of methods to for treatment of hydrogen sulfide in the reservoir.

(5) *Management and Decision Tools*.—development of methods to predict plume migration of salt water from pits; development of methods to calculate the full life cycle cost of material and waste handling in the petroleum industry; development of proper pit closure methods using a clay or compacted soil cap; development of improved methods for disposal of drilling wastes; development of methods to distinguish between historical oil field pollution and recent, current and/or ongoing pollution.

In addition to working with our Industrial Advisory Board, IPEC will continue in fiscal year 2000 to build linkages with organizations that provide services to the domestic petroleum industry. IPEC is working with the leadership of these organizations to develop a synergy between their efforts and those of IPEC. These organizations form the IPEC Affiliates Group and include the National Petroleum Technology Office (NPTO) of the U.S. Department of Energy, the Interstate Oil and Gas Compact Commission (IOGCC), the Petroleum Environmental Research Forum (PERF) the Oklahoma Energy Resources Board (OERB), the Oklahoma Independent Petroleum Association (OIPA), the Gas Research Institute (GRI), the Office of the Oklahoma Secretary of Energy, the Osage Agency of the Bureau of Indian Affairs and the Oil Producers of Arkansas (OPA). Recently, Governor Frank Keating of Oklahoma named the IPEC Director to the Environmental and Safety Committee of the IOGCC.

Since 1994 IPEC has organized and conducted the International Petroleum Environmental Conference. Dr. Kerry Sublette, Director of IPEC, has served as chair of these conferences. This conference is quickly becoming the premier conference of its kind in the U.S. and represents the flagship of technology transfer for IPEC. The annual International Petroleum Environmental conference serves as IPEC's technology transfer flagship. In October, 1998 IPEC held the 5th International Petroleum Environmental Conference in Albuquerque, NM. There were over 350 in attendance from all facets of the oil and gas industry including independent and major producers, service industry representatives, and state and federal regulators. The program for the 5th conference featured several plenary lectures, over 150 technical presentations, exhibits, a poster session and a special symposium on the fate of oxygenates from gasoline in the environment. Co-sponsors of the conference included the Interstate Oil and Gas Compact Commission, the Railroad Commission of Texas, the Texas Independent Producers and Royalty Owners Association, the Gas Research Institute, the Oklahoma Independent Petroleum Association, the Oklahoma Energy Resources Board, the EPA Office of Research & Development, and the National Petroleum Technology Office of the U.S. Dept. of Energy. At the request of the IPEC Industrial Advisory Board, IPEC sponsored the participation of ten state regulators from Oklahoma and Arkansas in the conference. The IPEC Science Advisory Committee also held its first formal meeting in conjunction with the conference. The next conference is planned for November, 1999 in Houston, TX.

FUNDING OF IPEC

IPEC is seeking appropriations of \$2 million for fiscal year 2000 and the succeeding fiscal years 2001 and 2002 through the Environmental Protection Agency. The consortium will be responsible for at least a 50 percent match of federal appropriations with private sector and state support over a five-year period. The Consortium will be subject to annual review to ensure the effective production of data, regulatory assessments, and technology development meeting the stated goals of the Consortium.

PREPARED STATEMENT OF THE ROCHESTER INSTITUTE OF TECHNOLOGY

Mr. Chairman, and members of the Subcommittee, on behalf of the Rochester Institute of Technology, in Rochester, New York, thank you for this opportunity to share with you some information about RIT's National Center for Remanufacturing and Resource Recovery. This Center, which is located in our Center for Integrated Manufacturing Studies, is doing important research and technology transfer in a field that is of critical interest to our national economy from the standpoint of envi-

ronmental protection, energy conservation and global competitiveness. I would like to provide the Subcommittee with some background on the technology of remanufacturing, and explain why we believe it will be of interest to you, and in particular to the Environmental Protection Agency, which is within this Subcommittee's jurisdiction.

As you know, millions of consumer and industrial products are produced and disposed of every year, comprising a large part of the over 160 million tons of municipal solid waste Americans generate per year. Many of these products end up in overburdened landfills. Recycling offers an opportunity to recover the raw material contained in these discarded goods. But, even if goods are recycled, the energy, labor, scrap material, and money put into making the component parts are lost. There exists another, better alternative for many products—Remanufacturing. Remanufacturing is the process of restoring retired or dysfunctional durable goods to a “like new” condition. By restoring end-of-life durable products for reuse, remanufacturing prevents waste generation and the pollution, energy and raw material consumption that would be required to make a new product from scratch. For example, sixty percent of the energy required to manufacture a new automotive part can be saved by remanufacturing an old one, and in the process, greenhouse gas emissions are significantly reduced.

Remanufacturing makes good sense for the nation's economy too. Purchasing a remanufactured product can cost consumers 50 to 70 percent less than a new product. Companies benefit from avoiding hefty solid waste disposal costs. As a labor-intensive industry, remanufacturing also provides opportunities for employment and training. A survey of remanufacturing companies found that there are over 73,000 independent remanufacturing companies in the U.S. These companies employ nearly 500,000 people and have annual sales of over \$53 billion per year. Many remanufacturing firms hire unskilled workers or workers with disabilities, providing these individuals with job experience and skills.

Remanufacturing is a powerful example of how the goals of environmental protection and economic growth can go hand-in-hand. Remanufacturing is the process of recovering the component parts of end-of-life products, restoring them to a “like-new” condition, and returning those parts or products to service. Remanufactured products may be completely refurbished and returned to service as the same type of product, broken into components and utilized as after-market items, or dismantled into components and sold as parts in new and different applications.

Remanufacturing is pollution prevention and resource conservation in action. It is well known that preventing—rather than controlling—pollution is a cost-effective way to eliminate or minimize risks to humans and the environment. By restoring end-of-life durable products for reuse, remanufacturing prevents pollution and energy consumption from raw material extraction and manufacturing processes that would be required to make a new product from scratch.

Studies have shown that remanufactured engines require 50 percent of the energy and only 67 percent of the labor necessary to produce new engines. These savings for the manufacturer translate to savings for the consumer—rebuilt equipment is on average 40–60 percent less expensive than new equipment. Thus, consumers can have superior quality products at a low price and be “green” at the same time. More importantly, remanufacturing shows that the ability to produce a product at a substantial profit and the ability to produce environmentally sound products are not mutually exclusive.

New product manufacturing creates 87 percent of the waste produced in the U.S. Because remanufacturing recovers the value added during the initial manufacture of a product, it vastly reduces the energy consumption and waste associated with the manufacturing process. For example, the original manufacture of a product may require 6 times as much energy as the remanufacture of the same product. The recovery of natural resources is equally impressive. Remanufactured products usually consist of 80–90 percent used components which means that between eight to nine pounds of old material is recovered for every pound of new material employed in the remanufacturing process. In a specific illustration, remanufactured automobile starters annually save about 8 million gallons of crude oil, 52,000 tons of iron ore, and 6,000 tons of copper. Energy saved annually by remanufacturing worldwide equals the electricity generated by 5 nuclear power plants or 10.7 million barrels of oil.

On the consumer side, Kodak's single-use camera remanufacturing initiative salvaged parts and materials from 100 million single-use cameras as of May 1996, resulting in the diversion of 14 million pounds of waste from entering the waste stream. Of the total new cameras shipped in any given month, 77 percent are now returned for remanufacturing and Kodak is able to reuse about 85 percent of the parts.

Climate change and solid waste prevention are two environmental issues with an important underlying link. When products are reused, less energy is needed to extract, transport, and process raw materials. Using end-of-life products to make new products generally requires less energy than manufacturing from virgin materials. Consuming less energy leads to less greenhouse gas emissions being released into the atmosphere. By reducing the quantity of products that are thrown away, there is a reduction in greenhouse gas emissions associated with material decomposition in landfills and in incineration.

The U.S. Environmental Protection Agency has been encouraging waste reduction as one of many ways to mitigate global climate change. Expanding the agency's activities in this area by supporting research and development in remanufacturing would add significantly to the impact of the agencies' efforts.

Pollution prevention has become the guiding principle of EPA's efforts to protect the environment. The passage of the Pollution Prevention Act established the new policy "that pollution should be prevented or reduced at the source whenever possible." Past environmental protection policies emphasized the treatment of waste products rather than improving the manufacturing processes that produced them. The cost of complying with federally mandated pollution-control and clean-up programs has grown from \$26 billion in the 1970's to \$115 billion in 1990's. Despite the fact that more and more of our GNP is expended on environmental remediation, our landfills are filling rapidly and solid waste management is becoming a central concern of state and local governments.

Efforts to regulate the amount of solid waste associated with manufacturing are quickly becoming a reality for businesses seeking to do business in Europe. The European Community has adopted legislation dictating that no more than 15 percent of a scrap automobile may go to a landfill by the year 2002. This ratio is to drop to 5 percent by the year 2015. They will also soon require that manufacturers and distributors of consumer electronics products take back and recycle or dispose of used electronic equipment. Canada has expressed interest in similar legislation and in 1991 MITI, Japan's international trade ministry, issued regulations promoting the use of recycled materials and the recycling of durable goods themselves. Currently recycling techniques are only capable of reducing disposable waste to about 25 percent and, will be unable to meet the new stricter international standards. American industry will have to comply with these regulations if it wishes to sell products in these markets. Remanufacturing is more energy efficient than recycling and offers American industry a potential competitive advantage in serving these markets.

Notwithstanding all of its advantages, there are some obstacles to remanufacturing. Traditionally manufacturers have only taken into account the stages of product life cycle dealing with product design, manufacture, and service. Now that the retirement phase of a product has become a major area of interest in protecting the environment and increasing economic growth, the life-cycle has been expanded to include processes such as reuse, remanufacture and material recycle. Most products have been designed with disposal rather than remanufacturing as the end of the product life-cycle. Where design specifications are not available, these products must be "reverse engineered". These products are more difficult to remanufacture than those which were designed and produced with remanufacture in mind.

On one level remanufacturing is not a new phenomenon. Remanufacture of automotive parts has been around for more than 60 years and more recently the copier and printer industry has offered the consumer the environmentally sound alternative of purchasing Remanufactured toner cartridges. Today, without accounting for the activities of original equipment manufacturers (OEMS) and the Department of Defense, there are more than 73,000 remanufacturing establishments in the U.S. with annual gross sales in excess of \$53 billion. Despite the importance of this sector of the economy, it has gained little recognition. One reason for this invisibility is the diversity of its product sectors. The second reason is that nearly all of the firms are small to medium-sized independent companies. Only a few of the major OEMs have remanufacturing divisions. Eastman Kodak and Xerox are notable in the photographic and xerographic fields, Caterpillar, Detroit Diesel, and Cummins in diesel engines, and Copeland in refrigeration compressors.

With the exception of the Department of Defense and the original equipment manufacturers noted previously, the majority of small or medium size remanufacturers do not have, nor can they afford to support, an internal engineering and applied research capability. Much research, education, and support for industry will be required to make designing new products for remanufacture a standard practice in industry.

Remanufacturing is in many cases the most economically and environmentally sound method of dealing with end-of-life products. The remanufacture of goods pro-

motes the avoidance of waste and prevents needless use of energy. Remanufacture prevents the loss of non-renewable resources due to disposal and avoids the use of further non-renewable resources to replace discarded products. Remanufacturing can help to bring this society one step closer to a sustainable, closed-loop relationship between industry and the environment.

Funding Request for Fiscal Year 2000

For these reasons, RIT is proposing that the EPA provide support for the National Center for Remanufacturing and Resource Recovery. The EPA funding support, which will complement and leverage financial support from the State of New York and industry, will allow the National Center to develop and implement a host of remanufacturing research programs geared toward helping U.S. manufacturers both large and small learn how to make environmentally conscious products. The National Center will help EPA take the nation's efforts to recycle to a new and higher level—Remanufacturing.

The National Center's programs will help EPA's Science and Technology programs address one of the most pressing areas—environmental pollution at the source—by working directly with U.S. manufacturers on using remanufacturing techniques and processes to make needed environmental strides in manufacturing. EPA's Science and Technology program mission is to promote long-term basic and short-term applied research in a wide range of environmental and health concerns and to provide the scientific knowledge and technologies to prevent pollution. RIT's National Center for Remanufacturing will help EPA accomplish its short-term applied research mission and have a dramatic effect over time in reducing the pollution caused by U.S. manufacturers and their products.

The Rochester Institute of Technology is requesting EPA support of \$3,000,000 in fiscal year 2000 for support of activities of the National Center for Remanufacturing & Resource Recovery. These funds would be used in the manner described in Attachment "A." Part of the funding would be used for one-time costs to purchase major equipment items in support of the research plan. It is anticipated that the ongoing program costs of the Center will be approximately \$3,000,000 per year. RIT will seek \$3,000,000 per year for 4 additional years for environmental remanufacturing program costs from the federal government. Attachment "B" is an outline of the goals of the National Center for Remanufacturing and Resource Recovery.

RIT believes that by funding the National Center for Remanufacturing and Resource Recovery (NCRRR), EPA will further its mission. The National Center for Remanufacturing and Resource Recovery (NCRRR) is nationally recognized as having leading expertise in a variety of technical aspects of remanufacturing. This environmental remanufacturing research program is needed to raise the visibility of this emerging area of manufacturing and provide a place for industry, academia and government agencies such as EPA to come together to research and apply current and new Remanufacturing processes to real manufacturing situations.

The center is housed in a completed 157,000 square foot manufacturing laboratory—the Center for Integrated Manufacturing Studies—which is the perfect home for a national remanufacturing effort. This one of a kind facility, with its five large flexible research bays, is expressly designed to have the capability to provide industry and academic researchers with the ability to conduct full-scale testing of remanufacturing processes using state-of-the-art equipment.

The center is part of a technological university—RIT—which has a long and distinguished history of service to large, medium and small manufacturers through applied manufacturing research. In addition to this strong capabilities in Industrial, Manufacturing, and Mechanical Engineering, Packaging Science, Economics and Business, RIT has, in recent years, brought to bear on manufacturing problems, pragmatic solutions to meeting the technological and workforce needs in industries related to microelectronics engineering, imaging technologies and software engineering. RIT's Center for Integrated Manufacturing Studies (CIMS) brings to the National Center for Remanufacturing support labs in: simulation, reverse engineering, design for manufacturing and assembly, computer aided design and manufacturing, and ergonomics. CIMS also has state-of-the-art capabilities in technology transfer and distance learning.

NCRRR has established itself as a leading R&D center for the remanufacturing industry. The university created a Remanufacturing Database System for the nation, which will serve as a base for sharing findings with industry nationally and assisting individual companies in keeping abreast of advances in remanufacturing, government programs and regulations. RIT has also set up an Internet site for remanufacturing research.

By supporting the critical R&D needs of this economically and environmentally important industry, the EPA will enhance the industry's competitive posture; qual-

ity of goods; energy, natural resource, and environmental profile; save and, perhaps, create jobs in what has been a declining U.S. manufacturing sector.

Mr. Chairman, we have developed a multi-phase research program for the work that the National Center for Remanufacturing and Resource Recovery would like to initiate with the Environmental Protection Agency. Appendix A provides a summary description of this program, and the timeline and funding that would be needed to implement this plan. Our request for fiscal year 1999–2000 is \$3,000,000 to begin the first phase of this research program.

Thank you again, Mr. Chairman, for the opportunity to provide this testimony to the Subcommittee. If you or your colleagues have any questions about this project, please feel free to call and we will respond promptly to your requests.

ATTACHMENT A.—NATIONAL CENTER FOR REMANUFACTURING & RESOURCE RECOVERY

RESEARCH PLAN, TIMELINE AND BUDGET

The National Center for Remanufacturing and Resource Recovery (NCRRR) is focused on leading the remanufacturing industry into the 21st Century. The five-year goal of the center is to become a self-sustaining national resource for applied research that will provide technical solutions to real-life problems for remanufacturers.

Phase I Development and dissemination of life-cycle and design for remanufacturing tools to promote sustainable remanufacturing

Currently, there is not a good method for transferring knowledge obtained through the remanufacturing process back to the product designers so that new products are designed for remanufacturability. There is also limited availability of design tools for the evaluation of the life cycle costs of remanufacturing.

In this phase of the project, NCRRR will develop guidelines, metrics, and tools to promote design for remanufacturing and incorporation of life-cycle considerations into remanufacturing. Specifically, activities will include development and dissemination of: Product assessment methods and tools; Life cycle costing methods and tools; Economic recovery analysis techniques; Technology assessment techniques; and Disassembly and teardown analysis methods and tools.

Phase II Remanufacturing Technology Advancement

In a recent vision document crafted by the remanufacturing industry (“Remanufacturing Industry, Vision for 2020”), strong emphasis was placed on the need for targeted research and development to enable the remanufacturing industry to keep up with rapid technology changes and demands for quality products. NCRRR proposes to develop and conduct a focused R&D program to meet the technological needs of the industry.

Research areas will include: design for remanufacturing; reverse logistics; structural and material analysis; intelligent testing and diagnostics; reverse engineering; design capture; life cycle costing; failure mode analysis; and cleaning technologies. The goal of this research is to develop and disseminate tools and techniques that will lead to improved design and manufacturing processes.

Signature analysis, a technique for intelligent testing and diagnostics, was singled out in the vision document as a critical area in need of development. NCRRR has an established program in this area and will utilize funding under this grant to expand its activities to create and transfer practical industry-specific tools for predicting the useful life of electrical and electronic components.

Phase III Assessment of Pollution Prevention Opportunities in the Remanufacturing Industry

Over a year ago, NCRRR established a Clean Technology Team to develop and promote remanufacturing technologies and methods that use little or no hazardous material, generate little or no waste, and are safe for workers, the public and the environment. To date, the team has been very active in providing direct assistance, technology demonstrations, and R&D in environmentally preferable surface cleaning technologies. With funds under this grant, the team will expand its activities in the following areas: Reduced specification of hazardous materials in product and process design; Paint stripping; Processes to restore the physical attributes of components; Painting or other surface refinishing operations; Packaging; and Disposition of wastes.

In this phase NCRRR will identify pollution prevention opportunities in these areas for the remanufacturing industry. In particular, NCRRR will focus its work on identifying operations in the industry that tend to utilize persistent,

bioaccumulative, and toxic chemicals (PBT chemicals) and opportunities for substituting non-hazardous processes. These opportunities will be documented in a handbook for remanufacturers and will form the basis of subsequent work under this grant.

Phase IV Direct Assistance to Remanufacturers

In this phase, NCRRR will develop a program of direct assistance to remanufacturers aimed at implementing pollution prevention techniques and, in particular, reducing the use of PBT chemicals. Direct assistance will take several forms, including: site visits to remanufacturers to conduct pollution prevention assessments, with a focus on PBT use; development of recommendations on alternatives to PBTs; assistance with implementation of alternative technologies and methods; and assessments in NCRRR's Surface Cleaning Testing and Demonstration Facility to assist companies in finding alternatives to PBTs used in surface cleaning.

Phase V Technology Transfer

NCRRR will develop and carry out a technology transfer program aimed at disseminating information to remanufacturers on state-of-the-art clean manufacturing techniques, equipment, and chemistries that can be used as alternatives to those processes using PBT chemicals. Emphasis will be placed on those technologies that are both effective and are environmentally conscious, i.e., non-toxic, non-hazardous and resource-conserving.

Information will be disseminated in a number of ways, including: Developing and disseminating reports, case studies, fact sheets, and other printed informational materials; Providing up-to-date information on PBT alternatives on NCRRR's internet web-site; Conducting hands-on technology demonstration workshops; and Referring companies exploring new, non-PBT environmentally conscious cleaning technologies to companies already employing them.

NCRRR would conduct this work in close collaboration with key industry trade associations representing the remanufacturing industry, including the Remanufacturing Industries Council International (RICI); Automotive Parts Rebuilders Association (APRA); and the Engine Rebuilders Association (AERA).

At the conclusion of this project, NCRRR will have a database and a set of information products that it can use to continue its work on pollution prevention/PBT-use reduction. In addition, this information would be made available to other organizations, such as industry trade associations, state and federal agencies, and pollution prevention technical assistance organizations.

TIMELINE & BUDGET

Phase	FY2000				FY01	FY02	FY03	FY04
	Q1	Q2	Q3	Q4				
Phase I Life-cycle and design for remanufacturing tools								
Phase II Remanufacturing Technology Advancement								
Phase III Assessment of Pollution Prevention Opportunities								
Phase IV Direct Assistance								
Phase V Technology Transfer								
Total Budget								

PREPARED STATEMENT OF THE NORTHWEST INDIAN FISHERIES COMMISSION

Mr. Chairman, and Honorable Members of the Committee, I am Billy Frank, Jr., Chairman of the Northwest Indian Fisheries Commission (NWIFC) and on behalf of the tribes in Washington State I would like to thank you for the opportunity to offer written testimony concerning the Environmental Protection Agency's (EPA) fiscal year 2000 appropriations.

We are specifically requesting that programmatic funding levels to the Northwest tribes be included in EPA's budget under Section 104(b)(3) of the Clean Water Act. The purpose of our request is to continue implementation of the model Coordinated Tribal Water Quality Program for twenty-six participating tribes and tribal organi-

zations in Washington State for fiscal year 2000. Strong congressional support for the implementation of this tribal initiative began in 1990 and is present today.

However, we are losing ground in the implementation of these efforts. Erosion of base level funding is jeopardizing the federal government's long-term investment of this efficient and effective tribal water quality protection program. Support for this model tribal initiative is timely in as much as it implements the goals and objectives of the President's Clean Water Action Plan. It is an existing program that centers around watershed-based water quality protection by building partnerships and fostering inter-jurisdictional cooperation. All are critical components to protecting and restoring our Northwest salmon.

We respectfully request Congress to either:

(1) Appropriate \$3.10 million into the EPA's funding base

Under Section 104(b)(3) of the Clean Water Act, Section 319 of the Clean Water Act, or within EPA's Assessment and Watershed Program, appropriate \$3.10 million into EPA's funding base for twenty-six (26) participating tribes and tribal organizations in Washington State to fully implement the model cooperative tribal water resource program for environmental protection; or,

(2) Direct the Agency to utilize \$3.10 million in existing agency funding

From existing Section 104(b)(3) of the Clean Water Act, Section 319 of the Clean Water Act, or EPA's Assessment and Watershed Program funds, provide \$3.10 million for twenty-six (26) tribes and tribal organizations in Washington State to continue implementation of the model cooperative tribal water resource program for environmental protection.

Justification for this funding request is based on:

1. legal rights and obligations for the federal government to protect the treaty-reserved rights of the tribes,

2. the United States' trust responsibility to protect the health and environment of the tribes on a government-to-government basis;

3. cost effectiveness by utilizing a cooperative intergovernmental strategy to accomplish National clean water goals; and,

4. minimize conflict between multiple jurisdictions who manage water quality.

To assist the Committee members, I would like to summarize background relevant to our request.

BACKGROUND

The NWIFC request is on behalf of our nineteen (19) member treaty fishing tribes and the Hoh, Chehalis and Shoalwater Bay Tribes in western Washington, and the Yakama Indian Nation, Colville Confederated, Spokane, and Kalispel Tribes in eastern Washington. This request is to continue implementing the model Coordinated Tribal Water Quality Program that began in 1990.

Washington State has been blessed with bountiful rivers and streams. Five species of Pacific salmon and three species of anadromous trout utilize Washington State's streams during the fresh water stages of their life cycles. Historically, there were ample supplies of fish for ceremonial, subsistence, commercial and recreation purposes. Old growth conifer removal, riparian zone impacts, farming activities, and channelization of the streams has reduced the productive capacity of these streams to extremely low levels. Currently, there are Puget Sound salmon stocks listed under the Endangered Species Act.

In 1979, the United States Supreme Court re-affirmed the treaty tribes' right to harvest half of the harvestable number of anadromous fish passing through tribal usual and accustomed areas. In 1980, the Federal District Court held that the United States and the State of Washington must not permit degradation of fish habitat which would diminish the treaty harvest right, including point and non-point pollution sources. The Federal courts have recognized that protection of water quality and other attributes of fish habitat are necessary to secure the Constitutionally protected rights of the tribes to harvest fish.

The sovereign authorities of the Tribes and the legal principles enunciated in *United States v. Washington* along with other Federal court decisions support the basis upon which the tribes are involved with on and off-reservation environmental issues. As a result of Federal court decisions, the State of Washington has recognized the tribes as "co-managers" of the fish resource and water quality in our state. As co-managers in Washington, the tribes must have the resources to adequately participate in environmental protection programs.

The Environmental Protection Agency's (EPA) Indian policy (1984) of working with Federally recognized tribes on a government-to-government basis concerns more than 375 Indian tribes in the lower 48 states controlling over 52 million acres of land base. In our state, tribal reservations make up approximately six percent

(6 percent) of the State of Washington. Our tribes also have retained treaty rights not ceded to the United States. These usual and accustomed fishing grounds include most of the State of Washington. The combined area of Indian reservations nationally is larger than all of New England, yet EPA now devotes only a tiny fraction of its personnel and funds to environmental protection for the tribes.

This is clearly a discriminatory prioritization of Federal funds. On a national level, tribal reservations represent three percent (3 percent) of the land base of this nation. Although the EPA has worked closely with the states to implement adequate environmental programs, until recently, little had been done to accomplish the same for the tribal governments. Indian tribes are over two decades behind the states both in resources received from the EPA and in technical assistance provided by the EPA in developing tribal water program offices. A "front end" investment will promote cooperation and increased tribal involvement in environmental protection as has been the case between the EPA and state governments for the past 20 years. The Coordinated Tribal Water Quality Program is already enabling cooperative inter-jurisdictional partnerships.

We recognize, support and appreciate the successful efforts that have been made to improve EPA Indian Programs and tribal funding. Our request for Section 104(b)(3) funding is intended to stabilize existing program implementation activities. Another possibility may be within Section 319 of the Clean Water Act. However because of the legislated formula, the doubling of Section 319 monies proposed nationally for water quality protection efforts in fiscal year 2000, translates into only \$600,000 (one-third of 1 percent restriction) for tribal programs. This means 535 tribal governments must compete for a very small pool of tribal nonpoint source pollution management program funds. Clearly, a means must be found to support the long-term funding of tribal programs that seek to protect tribal treaty rights such as ours, or the efforts being made by EPA will not be successful.

TRIBAL/STATE ROLES

Beginning in 1990, the State of Washington has supported tribal involvement in environmental protection both off and on-reservation. The state is committed to work with the tribes on a government-to-government basis as "co-managers" of the water resource in the implementation of this program. The Federally recognized Indian tribes in Washington have developed a process with state, local government officials, and representatives of agriculture, industry, and environmental communities to address water resource issues on a government-to-government basis. The results of these discussions have outlined a cooperative process between the tribes, state agencies and programs, and local units of governments in areas of environmental protection. This process was highlighted as a case study example to countries around the world at the 1992 United Nations Conference on Environment and Economic Development in South America.

The Coordinated Tribal Water Quality Program, an EPA/Tribal partnership, has generated successful models of state/tribal inter-jurisdictional cooperation. Examples of these models are: the Tribal Water Quality Standards Template encouraging inter-governmental uniformity and coordination of water quality management; and, the Cooperative Management of the Clean Water Act § 303(d) Program, enabling state/tribal government-to-government process throughout the CWA § 303(d) listing and implementation processes.

The tribes must be part of the solutions to prevent and control water pollution in Washington State. The tribes must participate in these activities to protect their governmental interests and treaty fishing rights. In this time of existing and pending listings of salmon stocks under the Endangered Species Act, neither we, nor the resources, can afford to lose programs integral to our inter-governmental cooperative watershed program. The Coordinated Tribal Water Quality Program is part of protecting our nation's environmental heritage.

CONCLUSION

For seven years, Congress has recognized and supported the Coordinated Tribal Water Quality Program by appropriating funding to maintain its operations. Last year, Congress recognized the program without specifying monies. Our understanding of this change in Congressional action was due to the increased General Assistance Program/Indian Set aside and the expectation that the Coordinated Tribal Water Quality Program would be maintained with a portion of those monies. This has not occurred. The General Assistance Program monies are designated for capacity building—the Coordinated Tribal Water Quality Program is an existing and successful tribal initiative requiring stabilized implementation funding. This model program demonstrates how tribes can participate in environmental programs working

with EPA to realize its long-range objective of including tribal governments as partners in decision-making and program management of tribal lands and resources.

We appreciate the difficulty Congress is facing in making decisions for this next fiscal year. In the case of the EPA, Congress and the Administration will probably direct EPA resources to address those areas of highest risk to human health and the environment. Therefore, we want to reiterate that tribal reservations and protection of their treaty resources have not been adequately addressed for the past twenty (20) years and this, also, represents the highest of risks to this nation. To do otherwise would represent environmental genocide to Native Americans.

Sufficient and permanent funding is necessary to continue the tribal cooperative program. Certainty of funding is necessary for the tribes to hire permanent and professional staff to implement this program. Without an ongoing investment by Congress much of the good that has been accomplished to date will be lost.

Please consider our request for \$3.10 million for the Washington State Coordinated Tribal Water Quality Program. Once again, thank you for the opportunity to provide written testimony. Thank you also for your assistance in helping to develop a national model program of how tribal governments can address environmental protection in a cooperative watershed approach with state and local governments.

Thanks to this committee, we are making significant progress. This initiative is being supported at all levels of our governments. We hope you and the Committee will continue to look favorably on our request.

PREPARED STATEMENT OF THE NATIONAL GRAIN AND FEED ASSOCIATION

Mr. Chairman, members of the Subcommittee, the National Grain and Feed Association (NGFA) appreciates the opportunity to present its views on a very important issue to U.S. agriculture. Specifically, the U.S. Environmental Protection Agency (EPA) has proposed new safety measures for aluminum and magnesium phosphide that threaten the competitive position and economic vitality of many U.S. producers, grain handlers, exporters, millers and processors. This is a critical issue because aluminum and magnesium phosphides are the last remaining cost-effective fumigants available to U.S. agriculture. As such, these products play a vital role in U.S. agriculture's ability to provide a high quality, nutritious and affordable food and feed supply to domestic and foreign customers.

While this EPA proposal remains subject to revisions, the industry is alarmed by the total impracticality and extensiveness of the proposed regulations, which we believe have no scientific justification. We will work through the rulemaking process with EPA. However, we have been having dialogue with EPA since the fall of 1998—well before the Agency announced its formal proposals on aluminum and magnesium phosphide—and, thus far, EPA has not budged from its original unjustified position. It is for this reason that our industry has grave concerns about EPA's intentions and direction in the regulation of these highly important fumigants, and seeks with this testimony to raise concerns with members of Congress.

The NGFA consists of 1,000 grain, feed and processing companies that operate 5,000 facilities that store, handle, merchandise, mill, process and export more than two-thirds of all U.S. grains and oilseeds. About 70 percent of NGFA member firms are small businesses—country elevators and feed mills. Also affiliated with the NGFA are 36 state and regional grain and feed associations.

BACKGROUND

Aluminum and magnesium phosphides are used for indoor fumigation of raw agricultural commodities, animal feeds, and processed food commodities to control insects, and outdoor fumigation of burrows to control rodent and moles. Aluminum and magnesium phosphides react with atmospheric moisture to produce phosphine gas.

Once an infestation begins, fumigation is the only viable and cost-effective treatment of large amounts of stored agricultural products. Fumigation is particularly important in many Southern areas and during periods of warm weather because warmer temperatures favor increased insect activity. These fumigants are also used to meet domestic milling and regulatory requirements for insect control. Furthermore, aluminum and magnesium phosphides are often required to meet contract specifications of foreign customers.

Thus, loss of aluminum and magnesium phosphide could jeopardize the production and maintenance of high quality agricultural products in some regions and during storage in warmer times of the year. Furthermore, loss of aluminum and magnesium phosphide could undermine a large percentage of U.S. exports of agricultural products, including wheat, corn and many processed products.

Importantly, methyl bromide, the only other remaining agricultural fumigant now in commercial use, is scheduled for cancellation in a few years under provisions of the Clean Air Act. Other types of insecticides, although useful in a total pest control program, are not effective substitutes for fumigants. In addition, many insecticides are being reviewed under provisions of the Food Quality Protection Act. If use of these chemicals is restricted or canceled, the importance of aluminum and magnesium phosphides will intensify.

OVERVIEW OF EPA'S RMMS

On December 23, 1999, the EPA proposed a series of new safety measures called Risk Mitigation Measures (RMMS)—which must be used when fumigating products with aluminum and magnesium phosphide—as part of the re-registration of these fumigants. Specifically, the 1988 amendments to the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) required EPA to accelerate re-registration of all products with active ingredients registered prior to November 1, 1984. Aluminum phosphide was first registered in the United States in 1958. Magnesium phosphide was first registered in the United States in 1976.

During the re-registration process, EPA concluded that aluminum and magnesium phosphide do not present any food safety or ecological concerns. On the other hand, EPA found that there might be health concerns from acute exposure to aluminum and magnesium phosphide.

The NGFA has carefully evaluated EPA's proposed RMMS to determine what, if any, changes are warranted in current label safety requirements. To assist in this evaluation, a survey of NGFA members was conducted to obtain information on their utilization of aluminum and magnesium phosphide and the potential impact of EPA's proposed RMMS. Based upon this analysis, we believe that the overall impact of EPA's proposed RMMS would be to effectively preclude the future use of the last remaining fumigants available to protect the quality of U.S. agricultural commodities, processed products and finished products during storage and transit. Specifically, the NGFA believes that EPA's RMMS are unworkable, too restrictive and will not provide any meaningful safety or health benefits. We are particularly concerned with the following proposed RMMS:

Lower the Maximum Exposure Limit to 0.03 ppm

The EPA proposes to lower the maximum exposure limit to 0.03 ppm. This level is significantly more protective than the permissible exposure limit set by the Occupational Safety and Health Administration (OSHA) and the current limits approved by EPA for aluminum and magnesium phosphide.

We believe EPA's proposed 0.03 ppm exposure limit is overly restrictive and will not provide any meaningful health or safety benefits. EPA's proposed 0.03-ppm limit could significantly increase costs and the burden placed on applicators when fumigating with aluminum and magnesium phosphide. For example, lowering the exposure standard to 0.03 ppm will dramatically increase the chances that the exposure limit will be violated during routine fumigation operations and significantly increase the time needed to properly aerate a fumigated commodity.

In addition, questions remain over the ability of current technology to accurately measure or consistently verify that phosphine gas concentrations are at or below the proposed 0.03-ppm exposure limit. Without access to reliable and cost-effective measuring technology, fumigation with aluminum and magnesium phosphide would become more difficult and aeration could be unnecessarily prolonged.

Prohibit fumigation within 500 feet of a residential area. Require notification of residents and businesses within 750 feet of a fumigated structure

The EPA is proposing to prohibit fumigation with aluminum and magnesium phosphide within 500 feet of a residential area. The Agency is also proposing to require notification of residents and businesses with 750 feet of a fumigated structure so that they "can make decisions regarding temporarily leaving their property during fumigation."

We do not believe either proposal is based upon sound science. EPA has not shown that fumigation with aluminum and magnesium phosphide following current label directions will expose the public to harmful levels of phosphine gas. Furthermore, the 500-foot ban could eliminate fumigation in nearly 70 percent of current storage structures and fumigation of rail cars, barges, and ocean-going vessels. In addition, the 750-foot notification proposal could unnecessarily generate undue public alarm with the safe application of aluminum and magnesium phosphide.

EPA points to a series of phosphine poisoning incidents to justify their public health concerns when fumigating with aluminum and magnesium phosphide. However, an analysis of these incidents reveals that most alleged poisoning incidents re-

sulted from failure to follow current label directions or illegal use of these chemicals. Even the Agency admits that evidence of an alleged death from exposure to phosphine is weak and unlikely to support a definite or even probable cause-and-effect relationship.

The NGFA supports RMMs that adequately protect the safety and health of applicators, nearby workers and the public. In this regard, the safety record of aluminum and magnesium phosphide has been excellent with current label directions providing an appropriate level of safety. We also believe that RMMs must be based upon clear and convincing evidence of risk. RMMs should avoid raising undue public alarm over unsubstantiated or negligible risks and limit the use of anecdotal information in which the cause-and-effect relationship is not well established. Misuse should be addressed through label warnings.

Provide 24-hour pre-notification of local emergency responders

The EPA proposes that applicators notify local emergency responders at least 24 hours in advance of fumigation. Under current label directions, those applying aluminum and magnesium phosphide already annually provide comprehensive safety and health information on these fumigants to local officials. We believe that current requirements are adequate because aluminum and magnesium phosphide's excellent safety record when following label directions make it highly unlikely that local emergency responders will be required to respond to a poisoning incident. The 24-hour pre-notification would also be infeasible when loading rail cars.

Require additional monitoring and leak testing of fumigated structures

The EPA would require monitoring throughout fumigated structures, vessels and vehicles prior to unloading or disturbing fumigated products and leak testing of fumigated areas. We believe EPA's monitoring proposal is virtually impossible to achieve in most grain storage structures and vessels. We also believe EPA's leak testing procedures are unrealistic and not needed. Both situations are adequately addressed in current label directions.

CONCLUSION

The NGFA supports re-registration of aluminum and magnesium phosphide with general re-affirmation of current label directions. We believe that EPA's concerns would be better served by focusing on training and education of applicators and effective enforcement of current label directions.

We also believe that RMMs for aluminum and magnesium phosphide must be based upon sound science and reliable information; be clearly demonstrated as necessary to protect human health; be economically and operationally reasonable, and permit the continued routine use of these cost-effective and safe fumigants.

Thank you for allowing us to present our views on this important issue to U.S. agriculture. We will be contacting you in a few weeks to determine how we may work together to ensure that EPA's final RMMs for aluminum and magnesium phosphide are reasonable, necessary and appropriate to the actual risks posed by these fumigants when following current label directions.

PREPARED STATEMENT OF THE STATE AND TERRITORIAL AIR POLLUTION PROGRAM ADMINISTRATORS AND THE ASSOCIATION OF LOCAL AIR POLLUTION CONTROL OFFICIALS

The State and Territorial Air Pollution Program Administrators (STAPPA) and the Association of Local Air Pollution Control Officials (ALAPCO) appreciate this opportunity to provide testimony regarding the fiscal year 2000 proposed budget for the U.S. Environmental Protection Agency, particularly regarding grants to state and local air pollution control agencies under Sections 103 and 105 of the Clean Air Act. The President's request for fiscal year 2000 includes an increase of \$3.2 million for state and local air grants, under both Sections 103 and 105, for a total of approximately \$198.7 million. While STAPPA and ALAPCO are pleased that the President's budget acknowledges the need for additional funds, we believe this proposed budget leaves state and local air agencies with serious funding gaps that will make it difficult for us to continue to fulfill our responsibilities under the Clean Air Act. Accordingly, STAPPA and ALAPCO request an increase of \$30 million above the President's request for fiscal year 2000, which we will discuss in greater detail below.

STAPPA and ALAPCO are the national associations of state and local air pollution control agencies in the 54 states and territories and over 150 major metropolitan areas across the nation. Under the Clean Air Act, state and local air quality

officials have the primary responsibility for ensuring healthful air quality for our citizens. These agencies must carry out numerous activities to implement federal, state and local clean air requirements. These include programs to address particulate matter, ground-level ozone, toxic air pollution, acid rain and other types of air pollutants, many of which cause significant adverse health effects, including cancer, severe respiratory ailments and premature death. Air agencies must address new initiatives that focus on emerging problems, as well as carry out the core elements of our programs, which serve as the backbone of our nation's clean air effort.

STATE AND LOCAL AIR GRANTS SHOULD BE INCREASED

The President's budget request for fiscal year 2000 calls for an increase of \$3.2 million in grants for state and local air pollution control agencies, bringing the total amount requested to \$198.7 million. While we are grateful for the proposed additional funds and, perhaps even more so, for the recognition implicit in the increase that state and local air grants ought to be augmented, we believe the proposal is not nearly adequate to address our nation's environmental needs.

State and local air pollution control agencies face a serious shortfall in federal grants. This deficit is due to the fact that federal funding under Section 105 of the Clean Air Act has declined by over \$36 million since fiscal year 1995, while our responsibilities and the cost of state and local programs under the Clean Air Act have increased dramatically. These responsibilities include both new initiatives to address emerging issues, as well as ongoing activities to preserve the gains and improvements in air quality that we have already made.

As we reported to you last year, in the spring of 1997, the U.S. Environmental Protection Agency (EPA) and members of STAPPA and ALAPCO undertook a four-month, intensive study to identify and estimate the costs related to activities that should be funded with state and local air grants under Section 105 of the Clean Air Act. The calculations of additional need addressed both the deficiencies in existing programs and the support needed for new initiatives. The EPA/STAPPA/ALAPCO analysis determined that to operate a good, but not perfect, program, a total increase of \$98 million in federal grants to state and local air agencies under Section 105 of the Clean Air Act would be necessary (this amount did not address grants for the fine particulate matter monitoring effort under Section 103).

Among the many activities the study identified as being in need of additional funds were compliance assistance programs, especially for small businesses; development, replacement and/or upgrading of monitors (apart from fine particulate matter monitoring); collection of emission and pollutant data, especially related to emissions of toxic air pollutants; minor source inspections and permits; training; implementation of ozone strategies; implementation of strategies to address toxic air emissions in urban areas; and multi-state approaches to regional air quality problems. Last year we provided you and your staff with more detailed data about this study. We would be happy to provide you with this information again, if you wish. In spite of the fact that EPA participated in this study and recognized the need for additional funding, to date the agency has not requested the grant increases that this study indicates are necessary.

State and local air agencies would very much appreciate receiving the entire \$98 million increase in fiscal year 2000. However, we recognize that this is unlikely, especially in view of the very difficult task facing Congress in distributing finite resources to many worthy programs. We believe, therefore, that it is reasonable for the increase to be phased in over a three-year period. Since the President's proposed budget calls for a \$3 million increase, we request that you appropriate an additional \$30 million above the Administration's request, increasing the total amount for state and local air grants to \$228.7 million in fiscal year 2000. The balance of the increase—\$66 million—could then be added in fiscal year 2001 and fiscal year 2002.

CLEAN AIR PARTNERSHIP FUND

The President's budget request includes \$200 million for the Clean Air Partnership Fund, which will provide grants to form partnerships among the private sector, the federal government and state or local agencies for a variety of activities that will improve air quality. The fund is intended to promote multi-pollutant strategies, demonstration projects, innovative initiatives, technological advances and locally managed and self-supporting activities, among other things, that will integrate control strategies to reduce multiple pollutants most efficiently. The Clean Air Partnership is designed to leverage state, local and private funds, which will enhance its ability to accomplish its goal of improving air quality.

STAPPA and ALAPCO are pleased that the Administration's request includes these additional funds for the Clean Air Partnership. The proposal will provide state

and local agencies with excellent opportunities to develop multi-pollutant control strategies aimed at reducing air pollution in a cost-effective manner. We believe that the harmonization of various clean air goals, such as the reduction of greenhouse gases through criteria pollutant control programs, for example, is critical and we applaud EPA for promoting such activities. We plan to work closely with EPA as it develops this program more fully.

In light of our support for the Clean Air Partnership, we urge Congress to include in its appropriation to EPA the \$200 million that the President requested for the program. These funds should be in addition to those federal grants (discussed earlier) that assist state and local air pollution control agencies in fulfilling their responsibilities. While the partnership is a laudable new program, there are still many other critical activities that we can carry out only through federal grants provided under Section 105 and other authorities of the Clean Air Act. The partnership program is not intended to be a substitute for those ongoing grant programs, nor does it address the enormous budget shortfall we discussed earlier in this testimony.

EPA'S BUDGET

In order for state and local agencies to successfully obtain and maintain healthful air quality for our citizens, we need adequate federal funding. In addition to that, however, it is also critical that EPA's own budget be sufficient to allow the agency to meet all of its responsibilities. Without the tools, programs and rules the agency is charged with developing, state and local agencies will be unable to implement important federal air quality requirements. Therefore, we request that you provide EPA with sufficient funding to meet its obligations, even increasing funding above the President's budget request, where necessary.

For example, EPA for several years has been inappropriately earmarking state and local air grants for activities that the agency should be carrying out with its own budget. One such activity is training. Funding training activities is clearly a federal responsibility, yet EPA has been using state and local grant funds for these purposes for many years. Another example is the Emission Inventory Improvement Program, which will develop essential tools for collecting and reporting emissions data. EPA has used Section 105 grants, rather than its own budget, to fund this program. While these programs are critical, EPA should be supporting them with its own budget, rather than shifting the financial burden to state and local agencies. If EPA's own budget were increased in these areas, the agency would not feel compelled to commandeer state and local funds for these programs.

Another example of the inadequacy of the President's request is the reduction of \$1 million within EPA's own budget from air toxics rule development projects. These funds are being diverted to support characterization of the air toxics problem. While we agree it is critical to have a better understanding of toxic air pollution, this activity should not come at the expense of toxics rule development. We maintain that both these activities warrant adequate funding. In fact, underfunding rule development will actually cause funds to be wasted. If EPA does not meet the deadline for development of Maximum Achievable Control Technology standards, which is very possible, particularly if the agency does not have sufficient funding, state and local agencies will be required to develop the rules themselves on a case-by-case basis (pursuant to Section 112[j] of the Clean Air Act). Such a scenario would be inefficient and overly burdensome and costly for state and local agencies. Therefore, providing EPA with adequate funds will save resources in the long run.

In other similar examples, EPA's budget calls for a reduction of \$10 million for characterizing the composition of PM_{2.5} particles using chemical speciation studies, a reduction of \$1.3 million from emissions characterization for mobile sources modeling, and \$8.9 million from visibility-related programs, including regional approaches to haze. We are concerned that these large reductions will not allow the agency to develop all the necessary programs and tools that state and local agencies require to fulfill their responsibilities and hope that EPA's budget can be made adequate to allow the agency to do its best work.

CONCLUSION

Although we are pleased that the President's request calls for an additional \$3 million for state and local air grants, we believe the increase should be much higher. Specifically, we request an increase of \$30 million above the President's request for fiscal year 2000, raising the total for state and local air agency grants to \$228.7 million.

We support the Clean Air Partnership Fund and urge Congress to include funding for this program in the fiscal year 2000 appropriation. We do not believe this program is a substitute for state and local operational air grants under the Clean Air

Act, however, and the adoption of the partnership should not adversely affect appropriations for our current activities.

Finally, if state and local air agencies are to succeed in protecting air quality, we believe EPA must be adequately funded so it can fulfill its responsibilities.

Thank you very much for this opportunity to provide you with our testimony. Please contact us if you have questions or require any additional information.

PREPARED STATEMENT OF THE AMERICAN WATER WORKS ASSOCIATION

INTRODUCTION

AWWA appreciates the opportunity to present its view on the Environmental Protection Agency (EPA) budget for fiscal year 2000. AWWA and its members are dedicated to providing safe, reliable drinking water to the American people.

Founded in 1881, AWWA is the world's largest and oldest scientific and educational association representing drinking water supply professionals. The association's 56,000 plus members are comprised of administrators, utility operators, professional engineers, contractors, manufacturers, scientists, professors and health professionals. The association's membership includes over 3,800 utilities which provides over 80 percent of the nation's drinking water.

AWWA utility members are regulated under the Safe Drinking Water Act (SDWA) and other statutes. AWWA believes few environmental activities are more important to the health of this country than assuring the protection of water supply sources, and the treatment, distribution and consumption of a safe and healthful adequate supply of drinking water. We strongly support adequate levels of funding for EPA's drinking water, ground water protection and clean water pollution prevention programs.

REQUEST OVERVIEW

Adequate funding for drinking water research and for capitalization of the Drinking Water State Revolving Fund (DWSRF) are the two major areas of concern to AWWA in the EPA fiscal year 2000 budget request. AWWA believes that the fiscal year 2000 EPA budget request for capitalizing the drinking water state revolving fund and for drinking water research may not be adequate to meet the needs of the drinking water program. It should be noted that these programs, particularly drinking water health effects research, involve areas where relatively small funding increases offer significantly great public health, environmental and economic benefits to the nation's population. In the fiscal year 2000 EPA budget, AWWA recommends that the following funding be specifically appropriated for the indicated purpose:

- For the drinking water state revolving fund: \$1,000,000,000 (as authorized in the SDWA).
- For drinking water research: \$41,400,000 (as requested in the President's fiscal year 2000 Budget). Specifically designate funding for drinking water research and health effects research in the appropriation.
- For the AWWA Research Foundation (AWWARF) drinking water research: \$4,000,000 including \$1,000,000 for arsenic in drinking water research.
- For research on treatment technologies relating to perchlorate, to be conducted through the East Valley Water District, California: \$2,000,000.
- For public water system supervision (PWSS) grants to states: \$100,000,000 (as authorized in the SDWA).
- For the EPA drinking water program as indicated below:
 - Drinking Water Regulatory Development: \$43.9 million (as requested in The President's fiscal year 2000 Budget).
 - Drinking Water Implementation Initiatives: \$31.8 million (as requested in The President's fiscal year 2000 Budget).
 - Drinking Water Consumer Awareness: \$1.5 million (as requested in The President's fiscal year 2000 Budget).
- For the EPA Clean Water Action Plan: Appropriate the additional \$25.8 million in support of this plan as requested in The President's fiscal year 2000 Budget.

DRINKING WATER STATE REVOLVING FUND (DWSRF)

AWWA believes that the fiscal year 2000 EPA budget request for capitalizing the newly authorized DWSRF may not be adequate to meet the nation's drinking water needs. The SDWA Amendments of 1996 authorized for the DWSRF \$599,000,000 for fiscal year 1994 and \$1,000,000,000 for fiscal years 1995 through 2003. The SDWA further authorizes that authorized funds not appropriated in a fiscal year may be appropriated in subsequent fiscal years until fiscal year 2004. Through fiscal year

1999, Congress has appropriated approximately \$2.4 billion—a shortfall of \$3.2 billion from funds authorized for the DWSRF.

According to the EPA Drinking Water Infrastructure Needs Survey released on January 31, 1997, \$12.1 billion is needed in the immediate future to protect drinking water supplies. Of this amount, \$10.2 billion, or 84 percent, is needed to protect water from microbial contaminants which can produce immediate illness or death. Over the next 20 years EPA reports that \$138.4 billion will be needed to upgrade the infrastructure of the nation's water utilities and we believe that the figure in the next needs survey will be much greater.

AWWA appreciates that the Administration's DWSRF budget request is \$50 million above the fiscal year 1999 appropriation and that both Congress and EPA have been incrementally increasing the appropriation each year; however, given the enormous need and that funding for the DWSRF is already behind a continued strong commitment to appropriate the authorized funding level is necessary. We urge Congress to appropriate at least the \$1 billion authorized for the DWSRF in fiscal year 2000.

Although it represents only a fraction of the need, the amount recommended by AWWA for the DWSRF will be a start and provide a source of much needed loans for financial disadvantaged communities which cannot obtain financing through other means. The federal funds will leverage state resources by ultimately becoming a revolving fund that would no longer require federal funding. The DWSRF would partially fund the unfunded mandates of the SDWA.

Recommended Action in the Fiscal Year 2000 Budget.—Appropriate at least \$1,000,000,000 for capitalization grants for the drinking water state revolving fund as authorized in the SDWA.

DRINKING WATER RESEARCH FUNDING

AWWA does not believe that the fiscal year 2000 EPA budget request for drinking water research is clear and it may not be adequate to meet the needs of the drinking water program. The EPA budget request is displayed by goals rather than program elements so it is difficult to determine how the program elements will be funded. The budget display shows an apparent overall decrease in research spending by the EPA Office of Research and Development. In testimony before the Senate Environment and Public Works Committee in March 1999, EPA testified that there was no funding gap for drinking water research for fiscal year 2000. Yet the research for regulations which are scheduled to be promulgated within the next few years does not appear to be completed and little or no research has been initiated on the contaminants for the next scheduled group of contaminants on the contaminate candidate list (CCL) which could mean that research will not be completed in time to affect the decisions on those regulations. We are prepared to work closely with EPA and other stakeholders to resolve any future research resourcing gaps beginning with the fiscal year 2001 budget process but this year's budget cycle process has past.

Over the past several years, public water suppliers have worked together with EPA and the Congress to secure increased research funding for the nation's drinking water program. We believe that through this cooperative effort needed increases in research dollars have been obtained for drinking water over the past few years after several years of steady decline. However, we are now uncertain how EPA is allocating the appropriation for drinking water related research. We are uncertain as to what portion of the agency's appropriations will be allocated for conducting health effects research on drinking water contaminants such as cryptosporidium, disinfection byproducts and arsenic. AWWA supports spending at least \$10 million for health effects research on these and other contaminants on an annual basis. Because the fiscal year 2000 EPA budget request and future research plans are unclear, we believe that EPA should provide a research plan (with full stakeholder involvement) on how the agency intends to do the necessary research in a timely manner to affect the key regulatory decisions involved in promulgating drinking water regulations for not only for the existing listed contaminants but also for new contaminant candidates. It is time for research strategic planning and execution within the drinking water program to become a public process subject to public scrutiny.

The use of good science as the foundation of the new drinking water standard-setting process under the SDWA amendments of 1996 will require extensive drinking water research—particularly health effects research. Funding for drinking water research is becoming more of a critical issue. The 1996 SDWA Amendments require EPA to develop comprehensive research plans for Microbial/Disinfection By-Products (M/DBP) and arsenic as well as other contaminants. An estimated total of over \$100 million is needed for the combined arsenic and M/DBP regulatory research plans

alone and this figure does not include other needed drinking water research on radon, a whole array of other radionuclides, groundwater contamination, children's health issues, endocrine disruptors, and other new contaminants that will require additional occurrence, treatment, and health effects research based on EPA's Contaminant Identification Method.

In August 2001—just 27 months from now—EPA will select at least five contaminants from the Contaminant Candidate List (CCL) and determine whether to regulate them. This process will be repeated every five years. To determine whether to regulate a contaminant and establish a maximum contaminate level (MCL) or another regulatory approach, EPA will need good health effects research. Recognizing the serious burden this regulatory mandate presents, the drinking water community has offered its time, resources and expertise to work with EPA to develop a research plan for the contaminants on the CCL. We have volunteered to cooperatively sponsor a workshop to produce a coordinated report and research strategy. If EPA agrees to our offer, and all indications are that they will, we anticipate returning to this Subcommittee with EPA to jointly recommend appropriate drinking water research funding levels for the next fiscal year.

Given that drinking water research has long been underfunded and the enormous need for immediate research to meet the deadlines of the SDWA amendments of 1996, AWWA urges Congress to appropriate at least \$41,400,000 for drinking water research and specifically “earmark” it in the appropriation. Continued underfunding drinking water research will result in either delayed regulations or regulations promulgated without the necessary research.

Recommended Action in the Fiscal Year 2000 Budget.—Appropriate at least \$41,400,000 for drinking water research (as requested in the President's fiscal year 2000 Budget). Specifically designate funding for drinking water research and health effects research in the appropriation.

AWWA RESEARCH FOUNDATION

In a separate statement, the AWWA Research Foundation (AWWARF), (an organization independent of AWWA), requested that \$6 million in drinking water research funds be designated specifically for AWWARF for drinking water research which includes \$1 million for arsenic research and \$2,000,000 for perchlorate treatment research. AWWARF and public water suppliers will match the unallocated \$3,000,000 portion of the grant dollar-for-dollar. AWWA strongly believes that this kind of local/federal research partnership is a wise and cost effective use of public funds and the only way to secure science based drinking water regulations in these difficult budgetary times. The AWWARF funds are being used to support priority drinking water research needs including disinfection by-products and cryptosporidium as well as arsenic.

The regulation of arsenic, which occurs naturally at low levels in some drinking water supplies, presents a unique regulatory situation. While the effects of arsenic at levels in excess of those typically found naturally in the nation's water supplies are well studied, there is a lack of data and serious scientific debate on the effects of the naturally occurring low levels of arsenic in drinking water.

Recommended Action in the Fiscal Year 2000 Budget.—Appropriate \$4,000,000 specifically designated for the American Water Works Association Research Foundation, including \$1,000,000 for arsenic research.

PERCHLORATE TREATMENT RESEARCH

In separate statements, AWWARF and others requested \$2,000,000 for research technologies to remove perchlorate (a rocket fuel component) from drinking water supplies. The research is to be conducted through the East Valley Water District in San Bernadino, California. AWWARF is managing the previous research funds provided by the subcommittee for the East Valley Water District. AWWA believes that perchlorate contamination of drinking water may be of concern in other parts of the country and that this research will allow early corrective action. There is no known treatment to remove perchlorate from drinking water so this research is crucial for public water systems, especially those communities which have lost their entire drinking water supply because of the presence of perchlorate contamination in the water.

Recommended Action in the Fiscal Year 2000 Budget.—Appropriate \$2,000,000 for research on treatment technologies relating to perchlorate within the Crafton-Redlands Plume, to be conducted through the East Valley Water District, California.

PUBLIC WATER SYSTEM SUPERVISION GRANTS

To comply with the SDWA, Congress intended that EPA develop drinking water regulations and that the states implement and administer the program to ensure compliance with and enforcement of its provisions. Implementation, administration, compliance and enforcement activities are collectively known as “primacy” requirements and federal grants to the states are known as Public Water System Supervision (PWSS) grants. The massive demands on states arising from the SDWA have become increasingly apparent because of the dramatic increase in the number of regulated contaminants over the past few years.

As each regulation is added, state resource shortfalls become more acute. Additional regulations are scheduled to be promulgated over the next few years and the SDWA Amendments of 1996 added new responsibilities for the states such as source water assessments, a consumer confidence report program and alternative monitoring programs. The SDWA authorizes a federal share of up to 75 percent, but federal funding has approximated only 35 percent. The difference between state and federal shares of the program has become so great that, according to the Association of State Drinking Water Administrators (ASDWA), states are concerned that without the infusion of additional resources, they may be unable to successfully meet these requirements and will be forced to prioritize future workload efforts. ASDWA has stated that even with the infusion of funds from the Drinking Water State Revolving fund set-asides, the current PWSS funding level is inadequate to accomplish Congressional goals for comprehensive national public drinking water system oversight. Should this occur, public health protection will suffer a major setback.

EPA's budget request for fiscal year 2000 would not raise PWSS funding for states from its present level of \$90,000,000. We strongly urge Congress to appropriate the \$100,000,000 authorized for PWSS grants to states as the minimum necessary.

Recommended Action in the Fiscal Year 2000 Budget.—Appropriate \$100,000,000 for Public Water System Supervision (PWSS) grants to states.

EPA DRINKING WATER PROGRAM

EPA's drinking water program took on greatly increased responsibilities in the 1996 SDWA amendments. These responsibilities included developing a new regulatory process requiring additional science and risk analysis for regulations, create a contaminant occurrence data base and methodology to select contaminants for regulation, promulgate microbial and disinfectant/disinfection by-products regulations, identify new treatment technologies for small systems, administer the newly created drinking water state revolving fund, and develop regulations and guidelines for consumer confidence reports, operator certification programs, source water assessment and monitoring relief.

In satisfying these requirements, EPA has involved the public in the regulatory process to an extent not equalled by another federal agency and stands as a model for federal rule making. EPA has involved private citizens, scientists, drinking water professionals, medical professionals, public health officials, economists, and environmental and consumer advocacy representatives, as well as other experts in providing recommendations and how to carry out these new regulatory responsibilities. EPA and the Office of Drinking Water and Ground Water are to be commended for taking this new approach which should result in better regulations that protect public health.

The President's fiscal year 2000 Budget requested the following funding for the EPA drinking water program: \$43.9 million for Drinking Water Regulatory Development; \$31.8 million for Drinking Water Implementation Initiatives; and \$1.5 million for Drinking Water Consumer Awareness. Because of its exemplary approach to reforming the regulatory process, the EPA drinking water program budget request should not be cut to meet overall federal budget constraints. AWWA believes that funding the EPA drinking water program is vital to continue this new regulatory approach and urges Congress to appropriate the funds requested in The President's fiscal year 2000 for the drinking water program to continue to implement the new provisions of the SDWA.

Recommended Action in the Fiscal Year 2000 Budget.—Appropriate funding for the EPA drinking water program as requested in The President's fiscal year 2000 Budget including:

- Drinking Water Regulatory Development: \$43,900,000.
- Drinking Water Implementation Initiatives: \$31,800,000.
- Drinking Water Consumer Awareness: \$1,500,000.

CLEAN WATER ACTION PLAN

The protection of drinking water source supplies is one of the key elements in providing safe drinking water to the American people. It is safer and cheaper to prevent the contamination of drinking water supplies than to undertake expensive efforts to treat it after it has become contaminated. The Clean Water Action plan focuses on source water protection for safe drinking water, preventing polluted runoff, promoting a state-led watershed approach to restore and sustain watershed health and assisting states with reducing nonpoint source pollution by expanding state grant assistance. The agency is requesting an additional \$25.8 million to build on the foundation of last year's appropriation and the existing clean water program. AWWA urges the Congress to fund to the maximum extent possible, EPA initiatives to address source water protection for safe drinking water. However, AWWA does not support the reduction in other clean water programs such as the Clean Water Act State Revolving Fund to fund this initiative and hopes that funding for this action plan in other agencies will be supported by members of this subcommittee when considering other appropriations in full committee deliberations.

Recommended Action in the Fiscal Year 2000 Budget.—Appropriate the additional \$25.8 million in support of the EPA Clean Water Action Plan as requested in The President's fiscal year 2000 Budget without decreasing support to other clean water or drinking water programs.

This concludes the AWWA statement on the fiscal year 2000 EPA budget. We would be pleased to answer any questions or provide additional material for the subcommittee.

PREPARED STATEMENT OF TEXAS A&M UNIVERSITY

Mr. Chairman and members of the Committee, I am Ed Hiler, Vice Chancellor for Agriculture and Life Sciences in the Texas A&M University System. I appreciate the opportunity to appear before you today, to describe a few exciting research projects we have underway, and to ask for your support for continued federal funding. New technology is the life blood of American agriculture. With the 1996 Farm Bill and resulting phase down in federal farm programs, it is imperative that research continues providing a technological underpinning for agriculture. Today, I will describe several examples of how we can provide this underpinning.

ENVIRONMENTAL SERVICES OF RICE LANDS IN ARKANSAS, LOUISIANA, AND TEXAS

Privately-held rice lands provide a variety of ecological services, but they can also have adverse environmental impacts. Public benefits include wildlife habitat, water filtration through wetlands, and flood protection. Adverse impacts can include degradation of soil organic matter, salinization, sedimentation, agricultural chemical losses, and groundwater depletion. Elimination of Federal agricultural commodity price support programs is reducing acreage in some parts of the Rice Belt and increasing it in others—with the unintended result of decreasing ecological services in some regions and increasing adverse environmental impacts in others. Scientists from the Texas A&M University System, the University of Arkansas, Louisiana State University, and USDA-ARS will examine environmental benefits and costs of alternative rice production technologies and how we might strengthen communities and increase the environmental and economic benefits of rice culture. We are requesting funding of \$1,000,000 for this project for fiscal year 2000.

CONSORTIUM FOR AGRICULTURAL SOILS MITIGATION OF GREENHOUSE GASES (CASMGs)

American farmers can benefit from international agreements to reduce greenhouse gas emissions, but only if reductions produced by agriculture can be counted toward national goals. For American agriculture to benefit a scientifically defensible method is needed to calculate reductions in greenhouse gas emissions that result from improved conservation practices. A consortium (including Colorado State University, Iowa State University, Pacific Northwest National Laboratory, Montana State University, The Ohio State University, and the University of Nebraska) seeks funds to assess the economic and environmental consequences of agricultural and environmental programs and technologies designed to reduce greenhouse gas emissions. Assessments in fiscal year 2000 will include the impacts of possible government programs and conservation technologies on carbon dioxide and nitrous oxide emissions and/or absorption in agricultural soils. We are requesting \$10,000,000 for support of this program in fiscal year 2000.

PROTECTING OUR LAND AND WATER RESOURCES IN THE 21ST CENTURY

Droughts, floods, environmental concerns and ever-tighter agricultural profit margins make it imperative that we manage our land and water resources in the best possible way. High quality information about both environmental and economic impacts is needed to inform decision makers. Environmental issues that need to be considered include the risks of water and air quality degradation, soil erosion, and emission of greenhouse gases. For over a decade, researchers in The Texas A&M University System Agriculture Program, in cooperation with scientists from USDA, EPA, and other federal and state agencies and private industry, have developed several computer-based decision aids to help assess the environmental and economic impacts of land management decisions throughout the nation. The objectives of this initiative are to: (1) combine these decision tools into an integrated, easily used, computer-based package; (2) implement a program to train and transfer the package to agency personnel and other land managers; and (3) improve the package based on feedback from the private sector and governmental agencies. We are requesting \$2,000,000 for support of this program in fiscal year 2000.

CENTERS FOR EXCELLENCE IN ENVIRONMENTAL OPERATIONS

Dramatic growth in the Border Zone, between Texas and California, has stressed the existing water supply, irrigation, and waste water infrastructure to the limit. The most critical resource for continued growth in trade and manufacturing within the zone is plentiful, good quality water. The objective of this four-state (Texas, New Mexico, Arizona, and California) initiative is to provide effective training programs to increase water plant efficiency, protect public health from biological hazards, reduce water pollution, improve irrigation efficiency, eliminate waste and demonstrate new technology for water and waste water treatment. We are requesting \$5,000,000 for the Texas Engineering Extension Service to support of this project in fiscal year 2000.

TEXAS INSTITUTE FOR APPLIED ENVIRONMENTAL RESEARCH (TIAER) AT TARLETON STATE UNIVERSITY

The TIAER is assisting the agriculture and environmental communities and agencies nationwide to resolve environmental concerns associated with agriculture. It is currently working with EPA, USDA, state agencies, and other universities to develop conceptual approaches, including the planned intervention! micro-watershed approach" to deal with the impacts of agriculture on water quality. It is also developing modeling tools to analyze the economic and environmental impacts of policy alternatives for several watersheds in Texas and Iowa. We are requesting \$750,000 for Tarleton State University to continue support for this program in fiscal year 2000.

PREPARED STATEMENT OF THE COUNTY SANITATION DISTRICTS OF LOS ANGELES COUNTY

We would like to thank you for the opportunity to submit testimony to the Subcommittee in support of federal funding in fiscal year 2000 for an exciting research program focused on strengthening scientific understanding of the efficiency and sustainability of Soil Aquifer Treatment (SAT) for indirect potable reuse of highly treated recycled water. This research, which is taking place in California and Arizona, has national implications for enhancing sustainable development of communities by augmenting and protecting valuable groundwater supplies with recycled water. Over \$5 million in cash and in-kind services has already been committed to the investigation by various research sponsors and participants. In addition, Congress has appropriated \$1.9 million over the last two fiscal years to support the project. We are seeking an additional \$1 million in fiscal year 2000 to continue this important research.

The Soil Aquifer Treatment Project is designed to provide the data necessary to support the rational design and operation of SAT systems, to predict water quality improvements provided by SAT, and to answer important public health questions. The County Sanitation Districts of Los Angeles County, which serves over five million people in 78 cities in Los Angeles County, California, and Arizona State University are the project managers for the research in cooperation with the University of Arizona, the University of Colorado, Stanford University and the U.S. Geological Survey. We are joined in support of this funding by the Cities of Phoenix, Glendale, Mesa, Scottsdale, Tempe, and Tucson, Arizona; the Water Reclamation District of Southern California; the Los Angeles Department of Water and Power; the City of

Riverside, California; the Bureau of Reclamation; and the American Water Works Association Research Foundation.

As the arid West continues to develop and as sources for additional water supplies become more and more scarce, an increasingly important source of water for agricultural and urban use is recycled water. This water has the potential to alleviate water shortages and to provide important augmentation to existing sources. Soil Aquifer Treatment, which is currently in use in California and Arizona, is one technology that has the potential to economically supplement traditional treatment and storage systems for existing and future potable water supplies. This study will be of value not only in the West but in a number of other areas around the country where groundwater recharge is used to supplement potable water supplies, to control sea water intrusion in coastal groundwater aquifers, to control land subsidence caused by declining groundwater levels, to raise groundwater levels to reduce the cost of groundwater pumping, and to provide a means of treating wastewater prior to discharge. Most notably, the states of Florida, Massachusetts, Nebraska, Michigan, New Hampshire, New Jersey, New York, South Dakota, Texas, and Wisconsin, who already operate groundwater recharge facilities, will benefit from this research. This research will also benefit aquifer storage and recovery systems located in eleven other states.

Further, our investigations of SAT will help address the public health issues that all water suppliers in the nation face, such as source water protection and disinfection practices. The questions that will be answered by our study will be instrumental to the identification, characterization, and treatment of compounds in our nation's water supply so that we may better protect the health of our citizens.

THE NEED FOR THE STUDY

While groundwater recharge using recycled water has been used in the United States for several decades and has been the subject of a number of studies, the scientific and technical community's ability to fully address a number of complex public health questions has been limited by the nature of existing testing and study methodologies. The funds approved by Congress in fiscal year 1998 and fiscal year 1999 have enabled a higher standard of research on SAT by expanding the project's monitoring and analytical capabilities and will thus help enhance scientific understanding of the various biological, physical, and chemical processes in SAT that modify and improve the characteristics of recycled water. Funds have been used in part to follow up on research recommendations from the National Research Council's (NRC) Water Science and Technology Board study on the viability of augmenting potable supplies with recycled water. This work addresses critical areas of research identified by NRC as necessary to address the myriad of unknowns concerning SAT and the indirect use of recycled water for potable water supply including the fate and significance of disinfection byproducts, organics, and microbial pathogens.

Currently the SAT Project is in its second year of study, and valuable information has been developed to better understand the impact of SAT on water quality in terms of chemical and microbial pollutants, identifying monitoring criteria for viruses and other pathogens, and increasing public knowledge and awareness of SAT. Fiscal year 2000 funds will be used to address key drinking water quality issues related to the importance of the municipal wastewater source in determining water quality, the use of tiered chemistry testing and toxicity tests, including endocrine disruptor assays, to further characterize organic pollutants in water before and after SAT, and expanded microbiological assessments for viruses and emerging pathogens.

The results of our investigation will help us to better understand the complex nature of recycled water and SAT so that we may take advantage of the benefits offered by indirect potable reuse based on groundwater recharge such as: Additional water quality improvements; seasonal or longer-term storage without evaporative losses; protection of water resources against recontamination (with coliforms and parasites) by birds, mammals, and even humans; and prevention of algae growth and associated water-quality problems such as algae-derived taste and odor.

SAT DEFINED

Soil Aquifer Treatment can best be described as a groundwater recharge method using recycled water. SAT relies on percolation of the recycled water through soil and groundwater transport to further improve water quality prior to reuse.

—Soil percolation encompasses several processes that occur as water seeps downward through the soil under the influence of gravity to enter the groundwater

system. The soil acts as a filter to improve the characteristics of the recycled water through physical, chemical, and microbiological processes.

- Groundwater transport: After reaching the underlying aquifer, groundwater moves slowly to extraction wells. During transport, further water quality benefits are realized through a number of physical, chemical, and biological processes.

PURPOSE AND GOAL OF THE STUDY

The SAT Project is the first research program to focus broadly on SAT as a system. Its goals are to provide the data necessary to support the engineered design and operation of SAT systems, and to address factors that are of interest to health regulators for the development of regulations governing groundwater recharge projects.

Specific objectives of the project are to:

- characterize processes that contribute to organic chemical, nitrogen and pathogen removal and transformation during transport through the soil percolation zone and underlying groundwater aquifer;
- investigate and model relationships among above-ground treatment, wetlands polishing, and SAT;
- identify monitoring criteria that will provide proper assurances regarding the elimination of viruses and other pathogens;
- produce a framework or model within which SAT systems can be designed and operated to meet regulatory criteria.
- compare the effectiveness of SAT to other technologies; and
- increase public knowledge and awareness of SAT.

The effectiveness of SAT will be investigated and systematically analyzed to determine the efficacy of the protective barriers inherent in SAT systems: the interface at the soil-water boundary of the infiltration surface; soil percolation; and groundwater transport. The water quality benefits derived from the treatment in each barrier will be evaluated based on the reductions achieved in levels of organic carbon, nitrogen, and pathogens.

Field investigations and data gathering are being performed at six full- or pilot-scale recharge sites in California and Arizona. These sites offer a range of different effluent qualities and physical conditions such as depth to groundwater, soil and sediment type, etc. Laboratory work is also being conducted to analyze the data and develop the applicable models. These facilities are located in Phoenix, Mesa, and Tucson, Arizona; and Riverside, Los Angeles, and Los Angeles County. Some of the more unique research elements include use of genetic techniques to isolate and identify viruses; analytical methodologies capable of identifying over 90 percent of the materials comprising the organic makeup of groundwater and recycled water; unique tracers to track the movement of recycled water as it infiltrates the groundwater; and a public education/outreach component to disseminate the results of the study.

On behalf of the many public agencies, cities, and universities that are participating in this exciting and promising research project, we would like to thank the Subcommittee once again for the opportunity to submit this statement and for your previous support for this project. Soil Aquifer Treatment has great potential to alleviate the coming critical water shortages in the arid western United States and provide valuable information on a national level for source water protection and supply. We thank you again for your commitment to this project over the last two fiscal years and ask you for your renewed support to continue the research on this important project.

PREPARED STATEMENT OF THE NORTH AMERICAN LAKE MANAGEMENT SOCIETY.

On Behalf of the North American Lake Management Society I respectfully ask the Senate VA-HUD Appropriations Sub-Committee to provide \$20 million in funding for the Clean Lakes Program, Section 314 of the Clean Water Act. This program was a uniquely effective, cost efficient federal program that provided seed money to state lake programs and to local communities for lake protection and improvement projects on public lakes.

Our nation's lakes need serious attention. The National Water Quality Inventory 1996 Report to Congress indicates that 16 percent of assessed rivers and streams and 35 percent of assessed lake acres are not safe for fish consumption; 20 percent of assessed rivers and streams and 25 percent of lake acres are not safe for recreational activities (e.g. swimming); and 16 percent of assessed rivers and streams and 8 percent of lake acres are not meeting drinking water uses.

Last year, funds for the Nonpoint Pollution Program (Section 319) were doubled, and a Senate Colloquy was added to the budget language establishing congressional intent that Clean Lakes Program elements be adequately funded through 319. **THIS HAS NOT WORKED.**

The 314 program, as now combined with the 319 program, has been dwarfed by, and its priorities lost in, the much larger 319 program. The EPA has not taken action to assure that states have financial assistance targeted to support their lake management programs. Lake projects have fared poorly in the competition for Section 319 funding because 319 Program guidelines have tended to weed out 314 program priorities that they were not designed to cover. Also, funding decisions at the state level are made by the 319 program coordinators, who for the most part have chosen not to share their program money with another state agency. The two programs worked well in partnership, but the marriage has been a failure.

Here is what we have lost:

- Water Quality Assessment Grants, which states used to assess the condition of their lakes and reservoirs. These grants also supported volunteer monitoring programs that foster long term community interest and involvement in the health and well being of both lakes and lake watersheds.
- Diagnostic and Feasibility Studies were designed to identify the causes of problems found by the assessment grants, and look for innovative, cost effective ways to repair the damage done to lakes, their ecosystems, and their watersheds.
- Demonstration and Restoration Projects.—These greatly furthered the science of lake rehabilitation. Often, the kinds of research done in lakes, such as the use of aquatic weevils to control nuisance exotic plant growth, do not fit well under Nonpoint (Section 319) Program guidance. The Nonpoint program worked in partnership with the Clean Lakes Program at this stage of a project to address problems coming from the watershed.
- Post Restoration Monitoring.—To evaluate the effectiveness of the program, and guide the improvement of future projects.

As the only organization dedicated to building citizen/professional partnerships for applied lake management, NALMS is uniquely positioned to have our ear to the ground on this matter. Last year we provided you with a survey of state lake program managers and professionals that indicated a severe cutback in funding for Section 314 Clean Lakes Program elements under the umbrella of the 319 program. 37 of 49 state lake program managers responded that their state lake programs were severely cut, and they strongly recommended a return to separate Clean Lakes Program funding. A complete copy of these comments is available on our web site, www.nalms.org, under the Government Affairs Committee homepage. A quick update survey conducted this January indicates the situation is no better in most states, and has even deteriorated since last year.

Support is now building to pump new life into the Clean Lakes Program:

- The Sport Fishing and Boating Partnership Council has recommended that the EPA fund the Section 314 Clean Lakes Program. Agencies and organization that contributed to this recommendation are: B.A.S.S, Inc., National Marine Manufacturers Association, Outdoor Technologies Group, U.S. Fish and Wildlife Service, State Fish and Wildlife Agencies, International Association of Fish and Wildlife Agencies, American Sportfishing Association, BOAT/U.S., American Fisheries Society, American Rivers Trout Unlimited, Penzoid Products Company, Grady-White Boats.
- The Congressional Great Lakes Task Force has recognized this problem and has sent a letter to the OMB and the EPA asking that they request separate funding for the Section 314 Clean Lakes Program.
- The Council of State Governments' newsletter, ECOS, recently ran a front page article titled: "States to EPA: Bring Back Clean Lakes!" The last paragraph reads: "Will EPA respond to these concerns by reinstating a special-focus approach for lakes? The precedent is certainly there—a review of discrete programs managed by the agency runs the gamut from brownfields to print shops. The decision to lump lakes with other water resources apparently needs another look."
- The National Recreation Lakes Study Commission, in their March 1999 Draft Recommendations includes the following language: "The Environmental Protection Agency's (EPA) current watershed-based approach to protecting and enhancing our Nation's waters places inadequate emphasis on lakes. EPA has not provided funding for Section 314 (the Clean Lakes Program) of the Clean Water Act in the past five years. EPA's recently issued "Guidance on Use of Clean Water Act and Safe Drinking Water Act Authorities to Address Management Needs for Lakes and Reservoirs" encourages EPA Regional authorities and the

States to “recognize the importance of lakes and reservoirs as key elements of the aquatic ecosystem. However, this guidance does not provide resources for the full range of activities that were formerly authorized under the Clean Lakes Program”.

Lakes and reservoirs are the jewels of a watershed. They are the focus of public perceptions of water quality. They are also the settling basins for pollutants from the rest of the watershed. Because people love lakes, communities are willing to look upstream and to the watershed for ways to protect or clean up their lakes. But beyond the watershed, the Clean Lakes Program focused on the whole lake ecosystem. Degraded lake habitats, wetland loss, nuisance exotic species, and fishery imbalances are problems the Clean Lakes Program helped communities address. These problems are not traditionally covered under 319 project guidelines.

We believe that lakes are certainly as deserving of special program focus as are our wetland, estuaries, and coastal zones. Clean Lakes Program projects have been very cost effective and have been particularly successful in leveraging federal dollars with state and local funds. The program has been a model of partnership building between federal, state, and local levels; and between water quality, fish and wildlife managers.

NALMS believes that we need a separate Clean Lakes Program to refocus attention on the special needs of our lakes and reservoirs. We need to provide separate, adequate and consistent funding and guidance, which will allow the Clean Lakes Program to grow to better meet the needs of the states and their lake communities.

On behalf of the North American Lake Management Society, we respectfully ask that Congress make a commitment to bringing the Clean Lakes Program back to life with a \$20 million dollar appropriation for the coming fiscal year.

PREPARED STATEMENT OF THE WESTERN COALITION OF ARID STATES

The Western Coalition of Arid States (WESTCAS) is pleased to submit comments for the record, regarding programs contained in the U.S. Environmental Protection Agency's (EPA) fiscal year 2000 budget for your Subcommittee's hearing record.

WESTCAS is an organization of cities, towns, water and wastewater districts and associate agencies from the states of Arizona, California, Colorado, Idaho, Nevada, New Mexico, Oregon and Texas who are dedicated to environmentally conscientious planning of water resources and development of water quality standards for the unique ecosystems of the arid West. Of particular interest to WESTCAS and its member agencies are the federal programs that can further our goals through partnerships and scientifically sound regulation and guidance concerning our most precious resource—water.

STATE REVOLVING FUNDS

WESTCAS urges you to provide the \$1 billion per year authorized under the Safe Drinking Water Act for the Drinking Water State Revolving Fund for fiscal year 2000. Many surface and ground waters do not meet water quality standards. Communities face greater challenges in trying to provide their citizens safe potable water meeting all of the regulatory requirements. As more research is completed in the treatment of microbes and disinfectant and disinfection byproducts, communities will be faced with even greater costs to meet requirements. We also would urge you not to fund the Operator Certification Program for the Drinking Water State Revolving Fund which reduces funds available for loans to communities by \$30 million. We join with the Association of State Drinking Water Administrators in expressing concern that EPA has not asked for new funding for state primacy programs and that the Drinking Water State Revolving Fund “may become the primary funding mechanism of ‘convenience’ with the serious risk of eroding the corpus of an already limited fund.”

WESTCAS urges a higher level of funding than proposed by the administration for the Clean Water State Revolving Fund. The administration proposes to reduce funding by \$550 million and to authorize states to set aside 20 percent of the fiscal year 2000 allocation for grants for nonpoint source projects. We support funding for nonpoint source and estuary projects. Nonpoint source projects are critical to watersheds attaining the designated beneficial uses of water bodies, however more funding is needed in the total program in order for the objectives we all are striving for—restoration of our watersheds—to be accomplished.

RESEARCH FUNDING

Scientifically sound research is essential for effective drinking water and clean water quality programs. WESTCAS urges full support of funding for the various research projects undertaken in a timely manner to implement regulations required pursuant to the Safe Drinking Water Act and the Clean Water Act. We support the increased funding requested for Human Health Risk Assessment and recommend increased funding for Detection of Emerging Risk Issues and Drinking Water Research. A full understanding of microbial contaminants and disinfectant/disinfection byproducts is extremely important for the American people.

WESTCAS requests that EPA devote sufficient resources to implement in a timely way the agreed to provisions under the settlement documents in the WESTCAS Whole Effluent Toxicity (WET) litigation. We want to insure that the WET testing required in NPDES programs and WET testing to evaluate sediment quality is not used inappropriately to predict impairment of water quality when it isn't valid. EPA had targeted \$5 million for the ongoing program in fiscal year 1999 and it cannot be tracked in the fiscal year 2000 budget request.

AMERICAN WATER WORKS ASSOCIATION RESEARCH FOUNDATION (AWWARF) AND WATER ENVIRONMENT RESEARCH FOUNDATION (WERF)

WESTCAS urges partnering with both AWWARF and WERF for drinking water research and clean water research funds. These programs offer an opportunity to leverage EPA's research program and improve the time of completion of critical projects dealing with arsenic, radon, perchlorate, and many others.

DRINKING WATER—PUBLIC WATER SYSTEMS SUPERVISION GRANTS

WESTCAS urges a review of funding for the Public Water Systems Supervision Grants. Funding for this program has not increased, and with the new requirements placed upon the states for consumer confidence reports, operator certification and other regulations, it would seem that the existing level of funding is not adequate for the states.

We thank you for this opportunity to offer our comments on the fiscal year 2000 appropriations for the EPA. If we can answer any questions or provide additional information, please contact Peter Carlson, WESTCAS' Legislative Representative in Washington, D.C. at (202) 429-4344.

PREPARED STATEMENT OF THE METROPOLITAN WATER RECLAMATION DISTRICT OF GREATER CHICAGO

I am Terrence J. O'Brien, President of the Metropolitan Water Reclamation District of Greater Chicago, and on behalf of the Water Reclamation District, I want to thank the Subcommittee for this opportunity to present our priority for fiscal year 2000, and express our appreciation for your support of our requests over the years. The Metropolitan Water Reclamation District (District) is the sponsor for the federally approved combined sewer overflow (CSO) project, the Tunnel and Reservoir Plan (TARP), in Chicago, Illinois. Specifically, we are asking that \$10 million be included to continue construction of this project in the Subcommittee's VA, HUD and Independent Agencies Appropriations Bill for fiscal year 2000. The following outlines the project and the need for the requested funding.

INTRODUCTION

The District was established in 1889 and has the responsibility for sewage treatment, and is also the lead agency in providing sponsorship for flood control and stormwater management in Cook County, Illinois. In fact, the District was established in response to an epidemic, which killed 90,000 people in 1885. By 1900, the District had reversed the flows of the Chicago and Calumet Rivers to carry combined sewage away from Lake Michigan, the area's main water supply. The District has been involved with major engineering feats since its inception.

In an effort to meet the water quality goals of the Clean Water Act, to prevent backflows into Lake Michigan, and to provide an outlet for floodwaters, the District designed the innovative TARP. The TARP tunnels, which were judged by the Environmental Protection Agency (EPA) on two occasions as the most cost-effective plan available to meet the enforceable provisions of the Clean Water Act, are a combined sewer overflow elimination system. The TARP reservoirs, also under construction, will provide flood control relief to hundreds of thousands of residents and businesses in the Chicagoland area.

TUNNEL AND RESERVOIR PLAN

The TARP is an intricate system of drop shafts, tunnels and pumping stations which will capture combined sewer overflows from a service area of 375 square miles. Chicago will remove three times the amount of CSO pollution as Boston's projected removal—for approximately the same cost. The remaining Calumet tunnel system will provide 3.1 million pounds of biological oxygen demand (BOD) removal versus Boston's one million pounds of BOD removal per year. In fact, Chicago's CSO pollution problems are worse than the combination of Boston, New York, and San Francisco's pollution problems. The Chicago Metropolitan Area's annual BOD loading is 43 million pounds per year. This contrasts with the combination of Boston, New York and San Francisco's combined annual BOD loading of 35 million pounds.

A good portion of the remainder of the TARP system is to be built in the southeast side of Chicago and the southern suburbs (Calumet system), a low-income, highly neglected and highly polluted area. This community suffers from tremendous land, air and water pollution—literally a dumping ground for multimedia pollution ranging from chemical waste to serious water pollution.

Due to the enormous risk to the community, the District as the local sponsor cannot afford to leave the citizens vulnerable. Therefore, it is imperative that this work must continue. Because the construction industry is already doing work in the area, the climate is favorable for proceeding with this work at this time, producing significant cost savings. What we are seeking, then, is funding to advance federal work.

We have a proven and cost-effective program. In fact, we have estimated that TARP's cost is about a quarter of the cost of separating the area's existing combined sewer systems into separate sewage and stormwater systems. Upon reanalysis, the EPA has consistently found the TARP program to be the most cost-effective solution that will reduce the impacts by the greatest degree to meet the enforceable requirements of the Act, with the least amount of dollars. The project, while relating most specifically to the 52 tributary municipalities in northeastern Illinois, is also beneficial to our downstream communities such as Joliet and Peoria. These benefits occur because of the capture of wastewater in the tunnels during the storm periods and by treatment of the discharge before being released in to the waterways.

Since its inception, TARP has not only abated flooding and pollution in the Chicagoland area, but has helped to preserve the integrity of Lake Michigan. In the years prior to TARP, a major storm in the area would cause local sewers and interceptors to surcharge resulting in CSO spills into the Chicagoland waterways. Since these waterways have a limited capacity, major storms have caused them to reach dangerously high levels resulting in massive sewer back-ups into basements and causing multi-million dollar damage to property. To relieve the high levels in the waterways during major storms, the gates at Wilmette, O'Brien, and the Chicago River would be opened and the excess CSOs would be allowed to backflow into Lake Michigan. Since the implementation of TARP, some backflows to Lake Michigan have been eliminated. After completion of both phases of TARP, all backflows into Lake Michigan will be eliminated.

Since implementation of TARP, 358 billion gallons of CSOs have been captured by TARP that otherwise would have reached waterways. After the completion of both phases of TARP, 99 percent of the CSO pollution will be eliminated. The elimination of CSOs will result in less water needed for flushing of Chicago's waterway system, making it available as drinking water to communities in Cook, DuPage, Lake, and Will counties, which have been on a waiting list. Specifically, since 1977, these counties received an increase of 162 mgd, partially as a result of the reduction in District's discretionary diversion in 1980. Additional allotments of Lake Michigan water, beyond 1991, will be made to these communities, as more water becomes available from sources like direct diversion.

With new allocations of lake water, communities that previously did not get to share lake water are in the process of building, or have already built, water mains to accommodate their new source of drinking water. The new source of drinking water will be a substitute for the poorer quality well water previously used by these communities. Partly due to TARP, it is estimated by IDOT that between 1981 and 2020, 283 mgd (439 cfs) of Lake Michigan water would be added to domestic consumption. This translates to approximately 2 million people that previously did not receive lake water would be able to enjoy it. This new source of water supply will not only benefit its immediate receivers but will also result in an economic stimulus to the entire Chicagoland area, by providing a reliable source of good quality water supply.

TARP was designed to give the Chicago metropolitan area the optimal environmental protection that could possibly be provided. More importantly, no other project was found to be as cost-effective. In addition, the beneficial use of the project

is being enhanced by the addition of the flood control reservoirs now being designed and constructed by the Corps of Engineers, which will be connected to the tunnels for additional capture and storage of combined sewage during flood events. We believe TARP stands as a tribute to our nation's Clean Water goals and one that is being accomplished within the most economical constraints.

REQUESTED ACTION

The \$10 million we are seeking in fiscal year 2000 funding in the Subcommittee's bill will help keep the local sponsor whole for the advance construction it plans to accomplish on the Torrence Avenue Leg for the Calumet System of the congressionally-authorized TARP project. While the TARP project was originally authorized at 75 percent federal funding, the District as local sponsor has been contributing at least 50 percent of the total project cost. We greatly appreciate the Subcommittee's endorsement of our request over the years to advance the construction of this work. This fiscal year 2000 work will go a long way to address serious water quality, stormwater and safety problems. It will have a tremendously beneficial impact on a community, which suffers from water pollution and significant flooding problems. The EPA has approved the facilities plan for the overall TARP project and design has been completed. The EPA has identified this particular segment of work as the next critical section of the plan to be constructed based on significant water quality benefits.

Once on-line, the Torrence Avenue Leg of the Calumet System will capture 2.0 billion gallons of CSOs per year and will protect 15.6 square miles of the City of Chicago from raw sewage backup and flooding.

We urgently request that this funding be included in the Subcommittee's bill for the construction of the Calumet System of the TARP project. We thank you in advance for your consideration of our request.

PREPARED STATEMENT OF THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

FISCAL YEAR 2000 APPROPRIATIONS FOR THE U.S. ENVIRONMENTAL PROTECTION AGENCY

The Metropolitan Water District of Southern California (MWD) is pleased to submit comments for the record, regarding programs contained in the U.S. Environmental Protection Agency's (EPA) fiscal year 2000 budget for your Subcommittee's hearing on April 29, 1999.

MWD is responsible for meeting the supplemental water requirements of 16 million people living in the Southern California coastal plain and the economy which supports them. Our sources of water supply are the Colorado River and surface waters from Northern California. Of particular interest to MWD and our 27 member agencies are those federal programs that provide assistance and facilitate partnerships for addressing critical water resources issues.

MWD is pleased that the President's budget requests increased funding for the Drinking Water State Revolving Fund (DWSRF) over the prior fiscal year. The proposed funding of \$825 million, however, falls short of the \$1 billion authorized by Congress, and we urge that you support funding at the authorized level. We also ask that, in addition to the \$41.5 million request for safe drinking water research in the President's budget, you provide \$6 million to be designated for research through the American Water Works Research Foundation (AWWARF) and East Valley Water District in San Bernardino, California for activities described below. Lastly, we ask that you fully support the President's proposed fiscal year 2000 budget for other EPA programs benefiting drinking water quality, including those which are part of the Clean Water Action Plan.

While significant progress has been made in improving the quality of our nation's water, many surface and ground waters do not meet water quality standards. Further, as our understanding of the relationship between the contaminants found in our water supply and their effect on human health increases and detection methods are improved, new risks have been uncovered. Adequate protection of drinking water quality requires research to identify contaminant sources and effective control methods, financial assistance for implementation of end-of-the-pipe treatment and source water protection measures, and compliance monitoring to ensure existing laws and regulations are upheld.

STATE REVOLVING FUNDS

In California, water suppliers have identified drinking water infrastructure projects totaling in excess of \$7 billion that could benefit from low-cost DWSRF fi-

nancing. Nationwide, community water systems estimate they must invest over \$138 billion over the next 20 years to ensure delivery of safe drinking water. Of this amount, approximately \$12 billion is needed to meet current Safe Drinking Water Act (SDWA) requirements. Low-cost financing for projects which ensure safe drinking water supplies is critical for protecting the health of the more than 240 million Americans served by public water systems, and MWD strongly urges that you provide \$1 billion, the amount authorized by Congress for fiscal year 2000. This amount, while greater than the amount requested in the President's budget, is still only a small fraction of the funding needed by drinking water suppliers to meet existing SDWA requirements.

Significant investments are also needed to repair and replace aging municipal wastewater infrastructure and combined sewer systems. Low-cost financing is necessary to support substantial municipal water quality infrastructure needs over the next 20 years. Capital investments are also required to protect against non-point pollution sources, and for the first time, EPA has proposed allowing states to use up to 20 percent of their Clean Water Act State Revolving Fund (CWSRF) capitalization grants to fund such projects. The President has requested \$800 million for fiscal year 2000 for the CWSRF to support these activities which are also vital for ensuring protection of drinking water sources. MWD asks that you support the President's budget request.

NON-POINT SOURCE GRANTS

Another critical source of funding for source water protection projects is grants under the Clean Water Act's Section 319 Non-point Source Program (NPS). NPS grants are particularly important for smaller projects and projects where debt financing is unsuitable. Further, the NPS grant program is necessary to support the many watershed management activities fostered by the states. The President has requested \$200 million for NPS grants for fiscal year 2000, and MWD requests your support at the level in the President's budget.

Other EPA grant programs which help maintain or improve water quality and need your support are the CWA Section 106 Control Agency Resource Supplemental Grants (\$115.5 million), Wetlands Program Development Grants (\$15.0 million), and the Water Quality Cooperative Agreements (WQCA; \$19.0 million). Among other activities, section 106 grants provide funding for monitoring, water quality planning, and development of Total Maximum Daily Loads for impaired water bodies. The wetlands grants program will enable EPA to meet its goal of a net gain of 100,000 acres of wetlands by the year 2005. Wetlands provide an important cleansing mechanism which can protect drinking water sources. WQCA provides funding to address water quality problems created by storm water, combined sewer overflows, and confined animal operations, all of which potentially threaten drinking water sources. Your support for the President's fiscal year 2000 budget request for the above programs will enable EPA to carry out its mission.

DRINKING WATER RESEARCH

Scientifically sound research provides the underpinnings for effective drinking water quality programs. EPA's fiscal year 2000 budget, under its strategic goal of clean and safe water, includes \$41.5 million for safe drinking water research. This research will focus on developing dose-response data for certain contaminants such as disinfection by-products (DBPs) and pathogens, filling data gaps for contaminants on the Candidate Contaminant List (CCL), and identifying cost-effective methods for removing pathogens while minimizing DBP formation. Although not specifically noted in EPA's Summary of the 2000 Budget, we understand that funding will also be directed toward research on methyl tertiary-butyl ether (MTBE), an oxygenate added to some reformulated fuels to meet Clean Air Act requirements, and perchlorate.

Dose-response data is critical for the proper characterization of potential acute risks of drinking water contaminants, yet reliable data is frequently absent. The CCL is the basis of potential new drinking water regulations, and accurate data is essential in order to determine whether new regulations are warranted. In California, MTBE has been found in some groundwater wells and drinking water reservoirs, resulting in objectionable taste and odor and potential health risks. Similarly, perchlorate has been detected in groundwater sources of drinking water, and nearly two dozen wells have been taken out of service state-wide as a result of concentrations which exceeded state action levels.

Despite a very ambitious research agenda, we note that the President is requesting approximately \$6 million less for drinking water research for fiscal year 2000 than appropriated for the prior fiscal year. We urge that you restore the \$6 million

through designation of \$3 million for AWWARF for further research on drinking water contaminants such as DBPs and pathogens, \$1 million for AWWARF for research on arsenic, and \$2 million for the East Valley Water District in San Bernardino, California to continue research conducted through AWWARF on perchlorate. AWWARF and public water suppliers will provide 100 percent matching funds, and thus offer an opportunity to leverage EPA's research budget. We strongly urge that you support an appropriation of \$47.5 million for safe drinking water research, designating \$6 million of this amount as described above.

MWD also requests your support for EPA's budget request of \$56.2 million for its Human Health Risk Assessment program. Under this program, EPA will develop approaches for more biologically defensible health assessments instead of relying on default assumptions which may be at variance with known mechanistic data. The program will also carry out research on sensitive sub-populations, particularly children and infants and will develop improved methods for measuring total exposure from multi-media sources and multi-pathways. This research will help bring better science to the risk assessment process used in the development of drinking water standards.

EPA's 2000 budget includes \$49.8 million for research on Emerging Risk Issues, including endocrine disruptors. Endocrine disruptors can cause adverse reproductive outcomes affecting both human and ecologic health. The Endocrine Disruptor Screening and Testing Advisory Committee (EDSTAC), a stakeholder group formed by EPA to develop screening and testing recommendations, has identified DBPs as one of the chemical classes which should be subject to early testing. DBPs are formed as part of the disinfection process for drinking water. Disinfection is necessary to protect against microbial disease and has been responsible for the virtual elimination of widespread outbreaks of waterborne disease in the U.S. MWD asks that you support the President's funding request for research on Human Health Risk Assessment and Emerging Risk Issues.

DRINKING WATER—PUBLIC WATER SYSTEMS SUPERVISION PROGRAM GRANTS

EPA's 2000 budget allocates \$93.8 million for Public Water Systems Supervision Program grants. This funding is necessary for states with primary enforcement responsibilities to carry out their duties, including implementation of the 1996 SDWA regulations. Additional resources will be necessary to implement the changes resulting from the 1996 SDWA amendments, and we ask that you support this funding level.

BETTER AMERICA BONDS

The President's budget proposes to encourage the preservation of open space, protect water quality, and clean up Brownfields through a new, innovative Federal tax credit program. Under the Better America Bond Program, states and local governments would have the authority to issue bonds which provide Federal tax credits in lieu of interest payments by the issuing entity. This program would enable communities to acquire title to or purchase easements on environmentally sensitive and other land for purposes such as protecting water quality from polluted runoff. The President has requested bonding authority for the states of \$1.9 billion for fiscal year 2000, and we ask that you support this request.

We look forward to working with you and your Subcommittee. Please contact Brad Hiltcher, MWD's Legislative Representative in Washington, D.C. at (202) 296-3551, if we can answer any questions or provide additional information.

PREPARED STATEMENT OF THE MICKEY LELAND NATIONAL URBAN AIR TOXICS RESEARCH CENTER

The Mickey Leland National Urban Air Toxics Research Center (the Leland Center or NUATRC), was established by Congress under Title III, Section 301(p) of the 1990 Clean Air Act Amendments as a non-profit, public/private research organization to sponsor research on the potential human health effects of the 188 listed air toxics. NUATRC initiates research that is critical to conducting meaningful risk assessments to help assure that air toxics regulations will be cost-effective and balanced. NUATRC has become a nationally-recognized leader in air toxics personal exposure research. This research, and the ability of the Leland Center to make significant contributions to the peer-reviewed science on air toxics, is becoming more vital with EPA's initiation of the Integrated Urban Air Toxics Strategy and Residual Risk programs.

NUATRC has been operational for about six years and receives EPA assistance awards based upon Congressional appropriations. We use corresponding private sector funding to leverage these federal monies, with industrial firms being the major contributors. NUATRC has a small staff and utilizes an administrative services agreement with the University of Texas-Houston Health Science Center in the Houston Medical Center complex. This arrangement allows the Leland Center to take advantage of the world renowned scientific community at the University of Texas and the Texas Medical Center, as directed by Congress.

This testimony provides an update on the Leland Center's current research and future directions. The NUATRC continues to focus its research in several key areas, which we believe will help close significant data gaps on the potential human health effects of air toxics. These areas are the following:

- Human exposure to air toxics. Specifically, the relationship among outdoor, indoor and personal exposures to air toxics; the sources of those exposures; and the development of technology to better assess human exposure to air toxics.
 - Characterization of non-cancer health effects from air toxics exposures, primarily respiratory and immune system effects.
- Future research directions will include:
- Assessment of potential links between personal exposures to air toxics and human health effects.
 - Examination of possible rapid response to emerging air toxics incidents.
 - Small grants for new and minority investigators for air toxics research.

Strategic Research Directions

NUATRC has continued to make significant progress in fulfilling its Congressional mandate. It has achieved national recognition within the scientific community, EPA and the corporate sector for its personal exposure research. The Leland Center has profited significantly from the work of its Board of Directors, appointed by Congress and the President, and its Scientific Advisory Panel. This Panel, composed of 13 nationally-recognized scientists from the public, private, and academic sectors, develops the Center's peer-reviewed research program. This research is carried out at academic institutions and major research centers across the nation, under a scientifically rigorous award protocol.

In pursuing its research directions, NUATRC interacts with other research organizations and public and private institutions to leverage both money and scientific expertise. We have interacted with the National Center for Health Statistics, the Health Effects Institute, the Center for Air Toxics Metal Research, EPA, MIT, and many corporations to assess critical research needs, to avoid duplication of effort, and to build upon previous research.

Personal Exposure Research

The National Research Council's (NRC) March 1998 report *Research Priorities for Airborne Particulate Matter—Volume I* states that research on personal exposure and the relationships among outdoor, indoor, and personal exposure is one of the nation's most critical research priority areas. The NRC Report underscores the NUATRC Board of Directors' decision several years ago to pursue this line of research. NUATRC took an early lead in fostering this type of research and is now a nationally-recognized leader in research on personal exposure to air toxics.

As an initial effort, the Leland Center fostered the development of new, reliable, and cost-effective passive personal monitor that measures Volatile Organic Compounds (VOCs). NUATRC has two such major personal exposure research programs currently underway that are utilizing these personal monitors. These studies are being conducted by the Environmental & Occupational Health Sciences Institute (EOHSI) and Columbia University. Pilot studies for both projects were successfully completed in 1998 and the full studies are in progress in three major urban areas (Houston, Los Angeles, and New York City.) This research will characterize the personal exposures to VOCs, aldehydes, and metals on airborne particulate matter to which the individuals living in these areas are exposed. In addition, the work will examine how these exposures are influenced by outdoor and indoor sources, as well as the relative importance of mobile, point, and area emissions. These data will then be used in risk assessments to establish the most cost-effective means of reducing public health risks. Such research will help reduce a critical data gap in our understanding of the potential human health effects of air toxics and the relationships among personal exposures, emission sources and outdoor levels of air toxics.

Participation in NHANES

In addition to the EOHSI and Columbia studies, the Center began its collaboration with the Fourth National Health and Nutrition Examination Survey (NHANES), conducted by the National Center for Health Statistics for the Centers

for Disease Control. In this collaborative study, personal exposures to selected air toxics will be measured using passive personal exposure monitors in 1,000 NHANES participants.

Particulate Matter Methodology Development for Personal Exposure to Air Toxics

In an analogous approach to that used in the development of the exposure monitors used to measure VOCs, NUATRC is encouraging the development of the next generation of monitors to measure personal exposure to fine particulate matter (PM_{2.5}). The NRC reported that the development of new personal exposure samplers for measuring particulate matter constituents is "critical" as constituent analyses are the building blocks for other areas of research, particularly epidemiological research. NUATRC has recently released a Request for Proposal for the development of a new generation of particulate personal monitors. The research would come on line in early 2000. The development of a new PM_{2.5} monitor will facilitate large-scale studies on the potential effects of PM_{2.5} and its constituents, again providing critical information for air toxics risk assessments.

Air Toxics Health Effects

Measurement and analysis of personal exposures to air toxics is the critical first step in determining what health risks urban populations face from air toxics. The next step is to assess the potential link between those exposures and human health effects particularly those acute effects on the human respiratory and immune systems. While a great deal of research has been focused on determining the potential cancer causing effects of air toxics, relatively little effort has been devoted to determining the potential non-cancer effects, (e.g. human respiratory and immune systems). The importance of non-cancer health effects research has been underscored both by the NRC in its March 1998 report and by EPA in its draft Integrated Urban Air Toxics Strategy.

While current data suggest a possible adverse effect on the lungs and heart from exposure to PM, the reasons for such effects are not apparent. The current hypothesis is that toxic metals present on the PM contribute to adverse effects. The Center expects to fund two proposals for multi-year research projects on the potential health effects of particulate air toxics on human pulmonary and cardiovascular systems. The first study will test the hypothesis that the metals present on PM (and not the particles themselves) cause adverse respiratory and cardiovascular systems. Results from the study will provide insights into the relative toxicity to the respiratory and cardiovascular systems of different sizes of particulate matter, as well as the relative toxicity of the specific particulate metal species. The second study will explore the relationship between exposure to PM_{2.5} metals and human cardiopulmonary responses in both normal and chronic bronchitic populations. This study will help determine whether particulate metals cause adverse effects to the respiratory and cardiovascular systems of people without a pre-existing disease or that the metals exacerbate pre-existing conditions, like chronic bronchitis.

Small Grants for New and Minority Investigators

The Center is also supporting new and minority investigators in environmental health research. This New Investigator Award program is designed to facilitate community involvement in air toxics issues by encouraging younger researchers to explore critical air toxics environmental health issues in their immediate communities.

NUATRC Exploratory Research Program

NUATRC plans to support pilot study research on novel and important aspects of personal exposures to air toxics and the potential health effects of those toxics in urban populations. Such studies would include:

- Identification and evaluation of health effects in susceptible populations, such as children.
- Development of new techniques for assessing personal exposures.
- Development of personal exposure models for use in air toxics risk assessment.
- Determination of the mechanisms of action of air toxics in human cells.

Research grants under this program would be open to all investigators and interdisciplinary collaboration would be encouraged.

Rapid Response to Air Toxics Situations

NUATRC is developing a program to enable it to respond rapidly to air toxics incidents, such as the smoke/haze situation that occurred in the spring of 1998 in Houston, Texas. Such incidents could present a unique opportunity to obtain scientific information about high air toxics personal exposure levels and/or related public health concerns. Information from such incidents could be incorporated into other

national studies for linking high exposure levels of air toxics to potential health effects.

Personal Exposure Symposium

As previously stated, there is a critical need to characterize actual human exposures to air toxics and to assess the health consequences of those exposures. The purpose of a symposium on personal exposure research is to bring together key researchers in the field to highlight the current technology being used to assess personal exposures, major research initiatives and the development of a consensus regarding future research directions on personal exposure. Major academic researchers, EPA, state agencies, and the regulated corporate community will be invited to participate. We anticipate holding this symposium in Houston, Texas in the spring of 2000.

NUATRC Administrative Costs

NUATRC anticipates a moderate increase in its administrative budget in 2000. Due to the continuing expansion of the air toxics research programs discussed in this testimony, a 20 percent increase in administrative costs will allow a key addition to the scientific staff, specifically a full-time research director. This position is critical, as it includes managing the overall research programs, development of new programs, and interfacing with other research organizations and EPA to avoid duplication of effort and to build upon previous research.

Even with this increase, the NUATRC's ratio of research expenditures to administrative costs remains considerably lower than comparable research institutions, at less than 25 percent. We are proud of this efficient use of government research monies, and continue to seek ways to further reduce this ratio.

APPROPRIATIONS REQUEST

To carry out the existing and anticipated research programs, NUATRC respectively requests the Senate to appropriate \$2.6 million to the EPA research budget for the Leland Center program. The following table carries those programs described above, with the approximate annual anticipated costs.

Personal Exposure Research (EOSHI, Columbia)	\$630,000
Participation in NHANES	100,000
PM Methodology Development	260,000
Air Toxics Health Effects	400,000
—PM metals and respiratory/cardiovascular effects	
—PM metals and cardiovascular effects in brochitic population	
NUATRC Exploratory Research Grants	300,000
New Investigator Awards Program	200,000
Rapid Response Program	60,000
Personal Exposure Symposium	50,000
NUATRC Administrative Cost—University of Texas	600,000
Total	2,600,000

NUATRC Management

NUATRC is governed by a nine-member Board of Directors composed of leading academic administrators and regulatory and private sector executives. The Board also oversees the activities of the Scientific Advisory Panel. This Panel, composed of thirteen scientists and physicians from private companies (DuPont, ICF Kaiser and Dow Chemical, EPA), academic institutions (Harvard, Brigham Young, and the Universities of Minnesota, Pittsburgh, and Washington), and the National Jewish Medical and Research Center, develops the NUATRC research program. This diverse group brings both different expertise as well as different perspectives to the development of NUATRC's research program. All NUATRCs research programs are rigorously peer-reviewed.

Funding

To date, NUATRC has relied on Congressional appropriations and support from the private sector. Corporate contributors have been consistent through the years and include Exxon, Phillips, Texaco, Rohm and Haas Company, Sun Company, and FMC Corporation. We are continually seeking new private sector partners to participate in NUATRC's research initiatives. In addition, we are soliciting support from both local and national philanthropic foundations. We have begun an intensive development effort to increase our private sector support.

Conclusion

NUATRC is most appreciative of the support that we have received from the U.S. Congress. We believe that NUATRC is advancing in the manner anticipated by Congress. From a fledgling organization created by Congress in 1990, NUATRC has now become nationally-recognized for its research on personal exposures to air toxics. NUATRC will seek to advance research to help address the most critical scientific questions related to the potential human health effects of air toxics.

We are gratified by the participation of EPA scientists in our Scientific Advisory Panel discussions, and the continued positive interactions with EPA's Offices of Research and Development and Air and Radiation concerning NUATRC's research. We want to assure that NUATRC's research is complementary to EPA's other research initiatives, i.e., that there is no meaningful overlap in these programs. We believe that close scientific interactions and cooperation between these relationships with government and the corporate sector will help foster a consensus concerning the national debate over air toxics. Thank you for your attention to this request.

PREPARED STATEMENT OF THE AMERICAN PUBLIC POWER ASSOCIATION

The American Public Power Association (APPA) is the service organization representing the interests of the more than 2,000 municipal and other state and locally owned utilities throughout the United States. Collectively, public power utilities deliver electric energy to one of every seven U.S. electric consumers (about 40 million people) serving some of the nation's largest cities. The majority of APPA's member systems are located in small and medium-sized communities in every state except Hawaii. We appreciate the opportunity to submit this statement concerning fiscal year 2000 appropriations for programs under this Subcommittee's jurisdiction.

CLIMATE CHANGE ACTION PLAN VOLUNTARY PARTNERSHIP PROGRAMS

APPA generally supports the fiscal year 2000 Budget request of \$4 billion to fund the Climate Change Technology Initiative. The Initiative consists of a package of tax incentives and investments in research and development to stimulate increased energy efficiency and encourage greater use of renewable energy sources. APPA is an aggressive advocate of federal support for energy research and development. While these programs do not directly provide benefits or incentives to public power systems, APPA supports them nevertheless because they will result in substantial improvements to the environment.

Under the Initiative, the U.S. EPA will be directed to continue funding of the Energy Star, Green Lights and Landfill Methane Outreach programs. Public power systems have been active partners in these programs and other initiatives designed to improving efficiencies and lowering the cost of providing energy services to customers. We are particularly interested in the creation of a new \$200 million "clean air partnership fund." Under this, state and localities will be encouraged to leverage additional funds to finance efforts and projects to reduce greenhouse gas and other air pollutants.

Green Lights Program

The Green Lights program encourages use of energy efficient lighting to reduce energy costs, increase productivity, promote customer retention and protect the environment. Program partners agree to survey lighting in their facilities and to upgrade it, if cost-effective. Environmental benefits result from more efficient energy use and from reductions in emissions of carbon dioxide, sulfur dioxide and nitrogen dioxide, thus improving air quality. EPA provides program participants public recognition and technical support. Both large and small APPA member systems participate in this program including City Utilities of Springfield, MO; Concord Municipal Light Plant, MA; City of Georgetown, TX; Grant County Public Utility District, WA; Gray's Harbor County PUD, WA; Greenville Utilities Commission, NC; Indiana Municipal Power Authority, IN; Los Angeles Department of Water & Power, CA; Mason County PUD, WA; New York Power Authority, NY; Norwood Municipal Light Department, MA; Omaha Public Power District, NE; Orlando Utilities Commission, FL; Port Angeles City Light Department, WA; Puerto Rico Electric Power Authority, PR; Sacramento Municipal Utility District, CA; City of St. Charles Electric Utility, IL; Salt River Project, AZ; Virgin Islands Water & Power Authority, VI; Springfield Utility Board, OR, and Taunton Municipal Lighting Plant, MA.

Energy Star Programs

A number of EPA's Energy Star programs build on the successes of Green Lights. These important EPA programs are examples of successful public/nonpublic partner-

ships that promote the use of profitable, energy-efficient technologies as a way to increase profits and competitiveness while at the same time minimizing pollution. They include Energy Star Buildings, the Energy Star Transformer Program, Energy Star office equipment and the Residential Energy Star Program. APPA member systems participate in and support EPA's Energy Star efforts.

Landfill Methane Outreach Program

The Landfill Methane Outreach Program provides environmental benefits by encouraging utilities to make use of landfill gas as an energy source. Several APPA member systems participate in this program, including Illinois Municipal Electric Agency, IL; Jacksonville Electric Authority, FL; Emerald People's Utility District, OR; Los Angeles Department of Water and Power, CA, and Orlando Utilities Commission, FL. Utilities voluntarily agree to take advantage of the best opportunities to use landfill gas in generating power. EPA recognizes and publicizes the utility's efforts and provides technical assistance. One of the success stories cited by EPA occurred with APPA member system Emerald People's Utility District in Eugene, OR. This public power utility worked collaboratively with the State of Oregon, Lane County officials and a private investment company to develop a 3.4 MW plant at the Short Mountain Landfill. EPUD's general manager says landfill energy recovery is like "turning straw into gold," providing additional revenue to EPUD as well as a fee to the county.

COUNCIL ON ENVIRONMENTAL QUALITY (CEQ)

APPA supports the Administration's fiscal year 2000 budget request of \$3,020,000 for the Council on Environmental Quality (CEQ). As units of local government APPA member utilities have a unique perspective on environmental regulation. Public power utilities and others from industry have experienced a general lack of consistency in federal environmental regulation. While additional layers of government should be avoided, a central overseer can perform a valuable function in preventing duplicative, unnecessary and inconsistent regulations. The council is responsible for ensuring that federal agencies perform their tasks in an efficient and coordinated manner. For these reasons, APPA supports the existence and continued operation of CEQ.

SUPERFUND

APPA member systems also support the Administration's request of \$1.5 billion for Superfund cleanups. The Superfund Trust Fund as well as Superfund research programs are critical as we strive to improve air quality and our environment. The increased emphasis on expedited settlements and administrative relief, the Brownfields Initiative and more effective use of alternative dispute resolution by EPA are worthy goals.

Again, APPA member systems appreciate your consideration of our views on priority appropriations issues for fiscal year 2000.

PREPARED STATEMENT OF JOSEPH M. DESIMONE, PH.D.

Chairman Christopher "Kit" Bond; Ranking Member Senator Barbara Mikulski; and other distinguished members of the Subcommittee, I appreciate having the opportunity to share my comments about fiscal year 2000 funding priorities for the U.S. Environmental Protection Agency (EPA).

My name is Joseph M. DeSimone, Ph.D., and I wear many hats. I am first and foremost an educator and researcher, as a professor of chemistry at the University of North Carolina at Chapel Hill and of chemical engineering at North Carolina State University. I am co-director of the Kenan Center for the Utilization of Liquid Carbon Dioxide in Manufacturing, a not-for-profit research organization sponsored by 16 corporations from around the world.

With two of my former students, Timothy Romack, Ph.D. and James McClain, we developed carbon dioxide applications for cleaning in garment care, metal degreasing and textile processing. We founded Micell Technologies, Inc., in 1995 to commercialize these environmentally friendly cleaning systems. Located in Raleigh, North Carolina, we currently employ 32 people.

I want to convey for the record how important Environmental Protection Agency and National Science Foundation (NSF) support has been to me and my partners in developing the carbon dioxide technology platform to foster sustainable economic development. Seed funding and technical guidance from the EPA's Green Chemistry program were instrumental to our early research findings, which led us to the creation of specialty detergent systems that would dissolve in carbon dioxide. Micell

Technologies' Micare system—an alternative to traditional dry cleaning—eliminates the need for conventional dry cleaning solvents such as perchlorethylene (perc) which has been identified and regulated as a groundwater contaminant and a probable human carcinogen. Since our discovery and throughout our progress leading to commercialization, we have remained in close touch with EPA officials in the Green Chemistry and Design for the Environment (DfE) programs.

On February 5, 1999, in Wilmington, North Carolina, we launched the first U.S. dry cleaning operation utilizing carbon dioxide, and the success to date of this breakthrough will lead the way for Micell to open many more environmentally friendly dry cleaning locations around the country this year.

I am proud of this environmental success, but I want you and other legislators to share in that success because Micell's discovery was made possible in large part because of the federal seed funding I received from the EPA and NSF in the early lean years of my research. It is important for you to be aware of past successes and setbacks as this Subcommittee prepares its "mark" for fiscal year 2000 programming.

I encourage the Subcommittee to provide an additional \$2 million, over and above the Administration's budget request, to the EPA for the DfE Garment and Textile Care Program. Since 1992, the DfE has worked with the nation's 30,000 commercial dry cleaners—one of the largest users of chemicals that come into contact with the public. It all started at an international roundtable on dry cleaning in which industry leaders and the EPA agreed that health and environmental issues surrounding the dry cleaning industry could be addressed most effectively through a voluntary, proactive approach. The Design for the Environment program has been a catalyst for positive, environmentally responsible change in the dry cleaning industry as EPA professionals have brought together a variety of stakeholders: Garment and textile designers; dry and wet cleaners; manufacturers; fiber producers; retailers; consumers; employees; government purchasing agents; industry trade groups; environmental and health interest groups; and even researchers.

This leadership from the EPA has resulted in a life cycle approach that includes the identification of upstream industrial decisions and trends that impact garment care process choices.

DfE accomplishes its mission by publishing the Cleaner Technologies Substitutes Assessment for Professional Fabricare Processes (CTSA) which is a technical report presenting relative cost, risk and performance information on existing and new cleaning technologies and substitute solvents. Comprehensive data from Micell's liquid carbon dioxide dry cleaning machine will be featured in the next updated CTSA publication.

EPA—through the DfE program—also supports university research on various existing and new cleaning technologies, conducts training courses for garment care professionals on new technologies, develops case studies on new and existing cleaning processes, holds and attends conferences on an as needed basis, and publishes many fact-filled resource documents for its diverse audiences.

Now that a viable liquid carbon dioxide cleaning system is commercially available, it is imperative that the DfE program work as vigorously with stakeholders as the agency has done to educate them about new wet cleaning technologies.

As a result of enhanced awareness of available technological options, dry and wet cleaners can improve their operations and their bottom line while contributing to a safer workplace and a cleaner environment. The public—all taxpayers—deserve to understand the choices available to them in fabrics, cleaning processes and environmental protection.

The NSF has been instrumental as well by supporting basic scientific inquiries into the CO₂ technology platform. The NSF Young Investigator program and the Presidential Faculty Fellowship program through the Division of Materials Research supported my research at NSF. This funding allowed my early, not fully developed ideas to be explored at the start of my academic career in 1990 at the University of North Carolina at Chapel Hill. The results from this support led to numerous developments for improved polymer manufacturing and processing technologies to avoid the use of billions of pounds of organic solvents and even larger amounts of water that are currently used.

I appreciate your consideration of my viewpoint, and I hope this Subcommittee will agree to appropriate more funding for both the EPA and the NSF as it relates to green chemistry and education initiatives. Thank you.

PREPARED STATEMENT OF THE CITY OF MIAMI BEACH, FLORIDA

Mr. Chairman and Members of the subcommittee, my name is Neisen Kasdin, and I am the Mayor of the City of Miami Beach, Florida. I appreciate your allowing me the opportunity to submit testimony on a number of important initiatives for which the City of Miami Beach seeks federal assistance.

NORTH SHORE OPEN SPACE PARK /NORTH BEACH RECREATIONAL CORRIDOR PROJECT

The City of Miami Beach, Florida, seeks your support for funding to create the North Beach Recreational Corridor Project, an environmentally sensitive recreational greenway which will interconnect a series of park facilities distributed throughout the City's residential North Beach District and to tie into a regional network of recreational trails/alternative transportation routes.

The North Beach Recreational Corridor will provide a continuous route throughout the entire North Beach District interconnecting and improving public access to public parks, the beaches and other recreational, cultural and educational facilities.

The main recreational destination along the corridor will be the City's North Shore Open Space Park. The 35 acre facility is the largest park in Miami Beach and is a highly treasured natural resource. Under the City's plan, great emphasis will be placed on the preservation and enhancement of the park's natural ecosystems which include the beach shoreline, a sand dune system and a native coastal hardwood hammock. New native vegetation plantings are proposed between the back dune and coastal hammock areas, linking the two habitats and creating a stronger dune community. Clear cutting of exotic nuisance plant species will strengthen native plantings and help create a visual link from land to sea. An expanded interpretive center is proposed to improve public access to the highly successful Sea Turtle Hatchery program and other nature education programs and activities. This unique combination of natural resources and public facilities will offer the community an "environmental classroom" that will be highly conducive to the exploration and understanding of the barrier island ecosystem indigenous to Miami Beach.

In addition to the North Shore Open Space Park, the Corridor will also connect with the Altos Del Mar Park, Band Shell Park, Ocean Terrace Park, and the 64th Street Park facilities which offer a wide array of recreational and cultural amenities. The Corridor will also connect with eight beach access areas to enhance public access to the beaches and to encourage park-beach cross utilization. Seven regional parking facilities will also be connected to the recreation trail to help improve recreational facility access for our residents and visitors.

The estimated cost of the project is \$7.1 million. The City has secured \$3.1 million from a Park Improvement Bond Program and an additional \$840,000 in ISTEIA Enhancement Funds. An appropriation of \$3.2 million would provide the additional funds needed to allow this valuable regional recreational enhancement project to become a reality.

WATER SEWER REVITALIZATION

Description of the existing water system

The City of Miami Beach owns, operates and maintains the potable water system serving customers within the corporate limits. The potable water facilities include a water distribution system extending throughout the city, five existing water booster pump stations, and four welded steel ground storage tanks. A sixth water booster pump station is planned for location on the MacArthur Causeway at Terminal Island. Two elevated water storage tanks are located in the south area of the City; however, both have been removed from service and at this time there are no plans for future use of these tanks. The city's potable water is supplied exclusively by the Miami-Dade Water and Sewer Department (WASD), the department of the County that oversees operation of the County's water and sewer system.

Because the City of Miami Beach is a coastal barrier island surrounded by salt water, it was not practical or economical to develop its own water supply system. The least costly and highest quality water comes from the Biscayne Aquifer water supply wells located on the mainland and owned and operated by the County. The city maintains four large diameter metered supply interconnections with the County's distribution system.

The water distribution system has approximately 180 miles of water mains ranging from 2 inches to 36 inches in diameter. The water distribution system currently serves approximately 11,123 retail customers. The water distribution system serves 1,008 fire hydrants and 712 fire lines, and has 23,000 valves of various sizes. The system has 11,601 service connections.

Description of the existing wastewater system

The City owns, operates and maintains the wastewater collection and transmission system serving customers within the corporate limits. All land usage must connect to the sanitary sewer system as a matter of City policy, and there are no septic tanks in operation within the City. The system consists of 152 miles of lines, including both gravity sewers and pressurized force mains, and 23 wastewater pump stations. The wastewater system currently serves approximately 9,641 retail customers.

All wastewater generated within the City is sent to the WASD Central District wastewater treatment plant on Virginia Key for treatment and disposal. The 54-inch force main which conveys the wastewater to the plant is a subaqueous force main running from South Pointe under Government Cut to Virginia Key. This force main is owned and maintained by WASD. The County's wastewater collection, transmission and treatment system is divided into three districts referred to as the North, Central and South Districts, each served by its own wastewater treatment plant. In addition to Miami Beach, the Central District plant treats wastewater from the City of Miami as well as other communities and unincorporated areas within the Central District. The wastewater transmission system has the capability to transfer limited quantities of wastewater flows between districts.

Five-year capital improvement program

The City has developed a Five-Year Capital Improvement Program containing those projects needed in order to replace and upgrade components of the Water and Sewer Utility and to provide for the demands to be placed upon the Water and Sewer Utility by projected growth. In connection with the water system portion of the Five-Year Capital Improvement Program, all four of the Water and Sewer Utility's existing storage tanks will be replaced, all of the existing water booster pump stations will be renovated and upgraded and most of the water mains throughout the System will be either cleaned and lined or replaced and/or extended. The wastewater components of the Five-Year Capital Improvement Program emphasize will provide improvements to the wastewater pump stations, and to the gravity collection system to reduce the amount of infiltration and inflow into the wastewater system.

The cost of the projects included within the Five-Year Capital Improvement Program is estimated at \$105,208,000. The City expects to fund these improvements on a cash flow basis primarily from the proceeds of Series 1995 bonds and parity Bonds which are anticipated to be issued this year. This method of funding will provide most of the needed capital, but Federal assistance is still necessary to complete these much needed improvements. Therefore, the City of Miami Beach requests a 90 percent–10 percent local/Federal split in order to ensure that the City meets its goal. Therefore, we are requesting \$10.1 million to help up meet our goal of updating our system for the next millennium.

INDIAN CREEK WATERWAY REVITALIZATION AND GREENWAY PROJECT

The City of Miami Beach exists as a cluster of barrier islands, with the Atlantic Ocean on one side and the Biscayne Bay Marine Estuary on the other. The historic and scenic Indian Creek Waterway system snakes its way through this eight mile long chain of islands. Just after the turn of the century, these natural waterways were "improved" by dredging and the construction of seawalls to stabilize the shorelines and to allow the farmers who first settled the area, transport their produce out to Biscayne Bay and the Port of Miami. Indian Creek served as the main transportation corridor for the early settlers, and as the island community grew, it remained the spine that interconnected the public, commercial and residential areas throughout Miami Beach. Today, the shoreline development along Indian Creek runs the full gambit from large scale resort hotels to single family homes, but it is predominately comprised of low and moderate income, multi-family residential facilities.

Over the years however, these once pristine waterways have fallen into decline. The waterway improvements so altered the shoreline ecosystem that the mangroves and other native plants have died-out or been overgrown by nuisance exotic species. The steel and concrete seawalls have crumbled and collapsed.

The loss of native plant communities and the failure of the seawalls has resulted in substantial erosion of the shorelines and the undercutting of roadways and public and private structures. The erosion has also transported thousands of tons of sand and topsoil into the waterways. Silt and sediment from the eroding shorelines have smothered benthic marine life and clouded the water. In addition, the eroded shore-

lines allow rain water run-off to wash trash, debris, agricultural chemicals and other pollutants into the waterways.

The loss of water quality and ecosystem destruction has killed-off or driven away the manatees, dolphins, baitfish and gamefish populations which used to be in abundance throughout Indian Creek. The loss of the native wetland plant communities from along the shorelines has also substantially reduced the available habitat for many key bird, reptile and animal species, including many migratory birds which utilize our area as winter nesting grounds.

Through the Indian Creek Waterway Revitalization and Greenway Project, the City of Miami Beach proposes to create a Public-Private Partnership between the City, the Indian Creek Area Residents and Hoteliers, the State of Florida and the National Park Service to revitalize the Indian Creek Waterway and to restore its historic role as the backbone of Miami Beach.

The crumbling seawalls will be replaced with an innovative "living seawall" system. This will entail the demolition of the old seawalls and the construction of a new walls comprised of carefully intermeshed boulders of different sizes. The slope and elevation of the new boulder walls will be designed to closely mimic the natural tidal creek shorelines which pre-existed the seawalls. Geotextile liners will be installed along the eroded shoreline areas behind the new boulder walls to prevent future erosion and then the shoreline will be refilled with rich topsoil. The entire shoreline will then be replanted with native coastal plant species.

Once the shorelines have been stabilized, the upland areas will be developed to create a continuous public access corridor or Greenway. The Greenway would provide public pedestrian/bicyclist access along the entire length of the waterway with connections to residential area, resort areas, civic centers, the beaches and four other regional recreational trails/bike paths. Rest areas, vista areas and waterway access areas (fishing & canoe launching) will be interspersed throughout the greenway. Interpretive signage will also be incorporated into the project to educate residents and visitors about the historic landmarks and natural features along the greenway trail.

Finally, a comprehensive program will be implemented to maintain the shoreline improvements and to foster the continuing restoration, enhancement and protection of the Indian Creek Waterway System.

The City of Miami Beach requests an appropriation of \$3.75 million to implement this important initiative.

COASTAL EROSION INITIATIVE

(Innovative beach erosion prevention and sand recycling system demonstration Project)

Dade County, Florida has approximately 15 miles of sandy beaches. The Miami Beach Segment makes up 10.5 miles or 70 percent of that beach front area. The Miami Beach Segment is bounded to the north by Baker's Haulover inlet and to the south by Government Cut Inlet. The construction of these inlets, just after the turn of the century, left the Miami Beach Segment isolated between two complete barriers to along-shore sand migration. As a result, the Miami Beach Segment continuously loses sand through natural processes but can only regain sand through artificial means.

In the years that followed the construction of the inlets, the Miami Beach shoreline steadily receded. By the mid-1970's the shoreline had receded more than 500 feet and most of the sandy beaches had been lost. Property owners were forced to build seawalls, bulkheads and other hardened structures to prevent the coastal infrastructure from being undercut by the encroaching tides.

The City remains committed to identifying alternate sources of sand and expediting the evaluation of the environmental, physical and economic viability of the potential sources, to ensure that sufficient quantities of beach-quality sand are available to fulfill our future needs. However we have realized that continuing to pump sand on to our beaches without addressing the underlying causes of the erosion, will leave us in an endless cycle of needing more, increasingly expensive sand.

If the erosion cycle can be successfully slowed, it would reduce the demand for additional sand and save millions of dollars in renourishment costs; not to mention the elimination of the environmental, public and legal challenges to renourishment projects. To achieve this goal, the City embarked upon a program to develop new technologies which will slow down and help prevent beach erosion processes. A Sediment Budget Analysis Report, prepared for Dade County, revealed the presence of several "hot spot" areas along our shoreline which accounted for the majority of the sand that has been lost. Analysis of the data also revealed the presence of an area

of substantial sand accretion (accumulation) in a near shore area near the southern end of Miami Beach.

The causative factors behind these hot spots have been linked to changes in the shape (compass orientation) of the coastline and benthic topographical anomalies in the near shore area. The worst of these hot spots exist within two half-mile long areas along our shoreline. These two hot spots have been shown to be responsible for the loss of almost 200,000 cubic yards of sand each year. The hot spots also accelerate the erosion of the adjacent beaches for as much as a mile to the north, as the sand from the adjacent beaches slough down to fill the voids within the hot spots. With beach renourishment costs of about \$14/cubic yard of sand, these hot spots are responsible for the loss of more than 2.5 million dollars annually.

After detailed examination of the available data and careful consideration of the possible alternatives, our coastal engineers have designed a series of detached headlands or breakwater-type structures which will significantly reduce the rate of erosion within these hot spot areas and help to stabilize large sections of our beach. The size and configuration of these headland structures have been carefully "tuned" to the specific conditions at each of the hot spot areas. Our coastal engineers estimate that the elimination of each hot spot will widen and stabilize approximately one mile of beach. It is believed that these benefits can be gained without significant negative impacts to the down drift beach areas or offshore reefs. Sea turtle nesting in the area will also be enhanced by the widening and stabilization of more than two miles of beach.

The City of Miami Beach and Dade County have jointly initiated an emergency effort to develop and construct breakwater reef structure in the location of the two worst hot spots. Preliminary estimates indicate the breakwater structures will cost approximately \$450,000 each. The required funding has already been appropriated for the project and construction is scheduled to begin in mid-1999.

The City's master plan is to develop a series of erosion control breakwaters, positioned in key areas along the shoreline, to widen the beaches and slow the erosion process. Concurrent with the efforts to slow the beach erosion process, we plan to initiate a feasibility study/demonstration project to pursue an innovative and promising potential solution to our sand shortage problem. The Sediment Budget Analysis Report revealed the presence of a highly accretional near-shore area at the southern end of Miami Beach. The area is accreting sand at a rate of more than 200,000 cubic yards per year. Sand is accreting in the area because of the navigational Jetty that juts 1500 yards out to sea, along the north side of the Government Cut Inlet, at the southern tip of Miami Beach. The jetty structure acts as a barrier, blocking the natural, southerly migration of the near shore sand lens, which causes the migrating sand to pile-up on the north side of the structure. As more and more sand piles-up, the sand lens builds and creeps offshore toward the end of the jetty. Because the seaward end of the jetty extends out to the first line of coral reefs which parallel our shoreline, the jetty and the reef line together form a '19trap' which prevents most of the sand from being able to move further south. This near-shore lens is continuing to build and will eventually '19over-top' the reef and smother living corals. If authorized, the City will seek to have the overfill accumulating at the southern end of the segment "back passed" or pumped back up to the eroded beaches at the northern end of our beach segment.

Local government has already made a substantial investment in the development of this process. An appropriation of \$6.5 million will allow the City to complete a thorough engineering analysis of the entire system, obtain the necessary Federal and State permits, and contract for the renourishment of a mile long section of beach utilizing back-passed sand. This project will serve as a demonstration of the effectiveness of the Sand Recycling System and the importance of regional sediment management.

PREPARED STATEMENT OF THE MISSOURI RURAL WATER ASSOCIATION & NATIONAL
RURAL WATER ASSOCIATION

EPA RURAL WATER TECHNICAL ASSISTANCE AND GROUND WATER PROTECTION

Thank you Chairman Bond and Members of the Committee. My name is Dennis Flanery. I represent the State of Missouri on the National Rural Water Association Board of Directors. I am very honored to represent all of Rural Water in front of you today.

My message today is that we believe the funding for rural water technical assistance and small community groundwater protection is the most effective use of EPA funds you appropriate from the drinking water program. Each year this sub-

committee approves hundreds of millions of dollars for the EPA to increase the regulatory burden on small towns. In turn, EPA increases the number and stringency of the regulations, passing billions in compliance costs onto our small towns.

Much of this effort is misdirected because improving drinking water in small communities is more of a RESOURCE problem than a REGULATORY problem. Every community wants to provide safe water and meet all drinking water standards. After all, local water systems are operated by people whose families drink the water every day, who are locally elected by their community, and who know, first-hand, how much their community can afford.

Numerous studies have concluded that a majority of non-compliance with EPA regulations is not due to actual water contamination, but is caused by the complexity of the regulations. Also, studies by the National Rural Water Association and EPA have shown that small towns will quickly remedy any water problems when provided understandable education and additional resources. More regulations won't help poor communities which can't afford the current regulatory regime, much less a new set of regulatory hurdles. What works in small towns is providing common-sense assistance in a form they can understand and afford. It takes someone sitting down with them evening after evening, and working with them through the ENTIRE process. Giving them a copy of the federal register and a phone number to call is not helping. Attached is a list of the over one thousand on-site visits carried out in the State of Missouri last year.

Each time we help a community we educate them on their resources so that they can solve their problem on their own next time. THIS IS KEY . . . ENCOURAGING LOCAL responsibility and building local know-how. If the community does not accept and support measures to protect their water, no amount of regulation will protect it. The TA program promotes this kind of local initiative.

The need for technical assistance is increasing with the dramatic increase in new federal regulations including: consumer confidence reports, radon, ground water rules, operator certification, source water protection, disinfection byproducts, etc. Our rural water technical assistance staff will get thousands of the calls for help from each of these regulations.

When local communities take responsibility for protecting their environment they do it more effectively and economically than governmental regulations. This has been documented in our groundwater/wellhead protection program's rapid expansion to small communities all over the state in the last four years, a list of affected communities is attached to my testimony. My reason for pointing this out is that we are facing the same challenge in source water/non-point source pollution in rural areas.

As the Congress provides additional EPA funding (under the Safe Drinking Water Act and the Clean Water Action Plan) for source water protection, clearly we need a grassroots source water protection effort that will do for source water what the grassroots groundwater protection program did for groundwater. To this end, we urge you to expand the ground water initiative to include source water. Last year this House Committee provided \$7.5 million for an innovative grassroots source water protection program. We urge you to again provide this funding and to specifically designate the National Rural Water Association to carry out this program in each state. This will ensure a bottom up, locally supported element as contrasted with EPA's proposed top down regulatory approach.

Mr. Chairman, I will close with our request that the Committee include \$8.6 million in the EPA's budget for all state rural water technical assistance and our groundwater protection initiatives and to again provide \$7.5 million for an innovative grassroots source water program. Thank you for your past support and the opportunity to appear before you today.

PREPARED STATEMENT OF THE PASSAIC VALLEY SEWERAGE COMMISSIONERS

Chairman Bond and Members of the Committee, my name is Robert Davenport and I am the Executive Director of the Passaic Valley Sewerage Commissioners in Newark, New Jersey. I would first like to thank you for the opportunity to testify today.

PVSC owns and operates one of the largest wastewater treatment plants in the nation. We treat wastewater from 1.3 million people in 47 towns and cities and from over 300 large industries in Northern New Jersey.

When I addressed this distinguished committee last year our Passaic River/Newark Bay Restoration Program was just getting started. This year I'd like to thank you for your past support and update you on the progress and the achievements of the program we've made in the last year.

New Jersey is distinguished as being the birthplace of industry and manufacturing in the United States. The industrial centers of Newark, Jersey City and Paterson developed and thrived in the 1800's; generating the goods and capital that contributed to the building of our state and nation.

Unfortunately, the engineering standards at the time of this great development called for the combining of both storm water and sanitary sewers into one system. Therefore, when it rains, storm water enters the combined sewer systems and the capacity of the sewer lines is exceeded which causes a mixture of untreated wastes and rainwater runoff to discharge into the local waters. This, as you know, is called a Combined Sewer Overflow, or CSO. Engineers were simply unaware of the environmental detriment caused by combining both systems into one. Science followed the principle that dilution of wastewater by stormwater runoff in a combined sewer system would have minimal impact upon the environment. We have since learned that this is not the case. The Passaic River and Newark Bay are now faced with swimming prohibitions due to elevated coliform bacteria concentrations and fishing and shellfishing bans due to the contaminated river sediments. Dredged material disposal options are limited due to toxic contaminants such as heavy metals and organic compounds in the river sediments. Floatable debris impacts the aesthetic qualities of these water bodies.

While in the process of discovering the impact of CSOs on the environment, the economic base of Passaic Valley's combined sewer communities has experienced dramatic erosion. The cities of Newark, Jersey City, Paterson, Harrison, East Newark, Bayonne and Kearny are among the poorest communities in New Jersey, and each has a combined sewer system which continually threatens the water quality of the Passaic River and Newark Bay during wet weather events.

The traditional solution for reducing CSOs is to separate the storm water from the sanitary sewers. The estimated cost of this traditional solution will be well over \$5 billion. This has never been and will never be a feasible solution.

For the last 30 years New Jersey has been struggling to find a solution that is both economically viable and environmentally acceptable to the problem of CSOs. PVSC found just such a solution. The Passaic River/Newark Bay Restoration program has a three pronged approach to alleviate the ongoing pollution to these NJ resources.

The first element of the program is the implementation of plant wide improvements to increase the treatment plant's wet weather capacity from 368 million gallons per day to 700 million gallons per day. Combined sewer discharges will be reduced by 332 million gallons per day to attain 106 percent of EPA's Long Term Control Requirement for wet weather flow pollutant removal. The program will result in the removal of 4,000 lbs/year of Organic Compounds, 90,000 lbs/year of toxic heavy metals, and 12,000,000 lbs/year of Conventional Pollutants which is now discharged to the Passaic River and Newark Bay during wet weather.

The second element is a crackdown of toxic discharges to the sewer system. This work is being implemented in conjunction with the NJ Department of Environmental Protection. The goal is to locate and identify unknown sources of ongoing discharges of toxic chemicals of concern.

The third element is the Shoreline Cleanup portion of the program. We provide coordination and support to municipalities, counties, citizens, service groups, and local businesses to remove trash along the riverbanks in their communities. Gloves, trash bags, trash disposal and other supplies are given to volunteer groups to help them with their clean up efforts.

During the month of August 1998, PVSC's summer employees removed trash on a daily basis in urban parks along the River. Due to the success of last year's summer program, we anticipate covering more of the river's banks during the months of June, July and August.

I'd now like to share the results of last year's efforts with you. Last summer we assisted in 42 cleanups and helped remove more than 226 tons of trash from the Passaic River. So far, this year in two Earth Week cleanup projects we assisted over 500 volunteers whom we presented with a clean-up crew tee shirt as a thank you for their efforts.

We are looking forward to the June launching of a 50-foot skimmer vessel which will remove floating debris from the waterways in our district. Funds for the vessel's purchase were provided by the Port Authority of New York and New Jersey, and the cost of operation will be borne by PVSC.

PVSC is working with the State of New Jersey, the State of New York, and the USEPA on a bi-state program to reduce discharges of toxic materials throughout the New York/New Jersey Harbor Estuary. Led by PVSC, ten NJ wastewater agencies were awarded over \$300,000 to sample for toxic materials in combined sewer, stormwater and treatment plant effluents. An additional \$600,000 will be spent by

NJ to test the samples for toxic material. We have applied to the State of NJ for an additional \$2 million to enable us to track down the sources of the toxic compounds.

The real key to improving the water quality of the Passaic River and Newark Bay is to reduce Combined Sewer Overflows. PVSC's solution will cost \$82 million compared to the traditional solutions cost of over \$5 billion.

The State of NJ awarded PVSC \$15 million for the engineering design for the plant improvements needed to implement the program. An application was submitted to the USEPA for three projects to be funded by a grant authorized by your committee in the fiscal year 1999 Appropriations Bill. Local funds will be used to provide the match for the special appropriations grant. In an effort to accelerate the program, PVSC has applied for a \$25 million state revolving loan to finance the construction of a major component of the plan. We look forward to a late summer ground breaking for these projects.

In spite of all the progress we've made, the program is just beginning PVSC has exhausted its ability to fund additional work without continued Federal assistance. We are respectfully requesting \$10 million in Federal funds for this year to begin construction of the next elements in the plant improvements program. The completion of the next element will get us half way to our goal of doubling our wet weather flow.

Once again, I would like to thank you and the committee for your continued support for the Passaic River/Newark Bay Restoration Program. We strongly believe that this program will restore the Passaic River and Newark Bay as a recreational and economic resource for the region.

PREPARED STATEMENT OF THE EL PASO WATER UTILITIES PUBLIC SERVICE BOARD

Thank you Chairman Bond and Members of the Committee for the opportunity to provide testimony in support of \$13.5 million for the design and engineering phase of the New Mexico/Texas Water Commission's Regional Sustainable Water Project. My name is Ed Archuleta, and I am the General Manager of the El Paso Water Utilities Public Service Board and the Program Manager of the El Paso-Las Cruces Regional Sustainable Project.

The City of El Paso, Texas, and the City of Juarez, Mexico, rely on the water from the Hueco Bolson aquifer for the majority of their drinking water supply. This aquifer will be fully depleted within the next twenty-five years if an alternative year-round surface water supply is not found. It is the objective of the sustainable water project to create an alternative long-term surface water supply for the entire region.

This cooperative project will reverse the depletion of the major groundwater aquifers in our area and will provide a long-term, high-quality sustainable water supply for our rapidly growing bi-state/bi-national region.

To allow for the proper coordination and timely completion of the project, we urge the Committee to provide this specific funding as part of the Border Environment Infrastructure Fund (BEIF). The BEIF was utilized to fund the initial environmental and water resource studies for the project (\$3 million in fiscal year 1998) which are now being completed. By specifically designating these funds for the sustainable water project it has enabled the project to move forward with a minimum of bureaucratic interference. This approach to funding has the support of the EPA officials, Border Environment Cooperation Commission, and NADBank staff responsible for the implementation of the BEIF programs.

Project benefits include:

- Improving and protecting the quality of the region's ground and surface water;
- Preserving the Hueco and Mesilla groundwater bolsons;
- Implementing a year-round delivery system of surface water, which will enhance agricultural and municipal water supplies and the riverine ecosystem;
- Increasing surface water supply through efficient delivery and water treatment; and
- Continuing to meet treaty and compact requirements for delivery of Rio Grande Project water.

The El Paso-Las Cruces Regional Sustainable Water Project will benefit more people on the Texas/Mexico border than any other project that might be funded under the North American Free Trade Agreement (NAFTA). The affected region includes El Paso, TX, Las Cruces, NM and Ciudad Juarez, Chihuahua, Mexico. The current regional population is over 2 million, and is expected to more than double by 2025. Chronic unemployment is over 10 percent, yet the region's future economy, environment and quality of life is dependent on a reliable supply of water.

As mentioned above, concurrent with the region's population boom is the depletion of its local aquifers. Those underground water sources provide Las Cruces and Ciudad Juarez with 100 percent of their water, and El Paso with 57 percent. The Hueco Bolson, designated a Priority Groundwater Management Area by the Texas Natural Resources Conservation Commission, is expected to be depleted by 2025. The Sustainable Water Project will assure the long term preservation of this groundwater source.

This sustainable water supply project is the top environmental priority for this heavily populated El Paso region of the border. The \$13.5 million will design water plants in New Mexico and a plant in El Paso. The project includes an aqueduct system, storage tanks, pump stations, and aquifer storage and recovery system for the Hueco Bolson (to store water during periods of high runoff for use during periods of drought). The detailed phasing plan for these facilities will be completed by the end of the year.

Without federal assistance the project cannot move forward. State and local monies are difficult to obtain because the scope is regional and multi-jurisdictional and if any participant decides to use its funding as leverage then cooperation becomes more difficult. However, the availability of BEIF funds allows the process to proceed under the guidance of the New Mexico/Texas Water Commission. Attached is a list of participants in this process. We believe this is exactly what the Congress intended when NAFTA passed and the BEIF program was funded.

We thank you again very much for your past support for this project. We urge you to specifically designate the \$13.5 million from the BEIF program so that the next phase of the program can proceed immediately.

PREPARED STATEMENT OF THE BROWNSVILLE PUBLIC UTILITIES BOARD

Good afternoon Chairman Bond and Members of the Committee. Thank you for the opportunity to testify before you today. My name is Robert Lackner and I am Chairman of the Public Utilities Board in Brownsville, Texas.

Our purpose for testifying is to first thank you for your assistance last year in providing \$2.5 million to allow for the initial studies and regional coordination needed to initiate the Brownsville Weir and Reservoir project and, second, to request an additional \$3.5 million from the Border Environmental Infrastructure Fund to provide the federal share of the design and engineering for the next stage of implementation for the Brownsville Weir and Reservoir Project. The lack of a stable long term water supply in Brownsville and other lower Rio Grande communities is the top environmental need in the entire south Texas region.

The Brownsville Weir and Reservoir Project is the most feasible way to meet this need. It provides a means for capturing Rio Grande water that has passed all other river water users and which now flows directly into the Gulf of Mexico. The Weir is the most efficient way to conserve water for the use of the local communities.

The Weir would release adequate water to satisfy all local environmental and downstream uses. The Project uses the existing river channel for storage and will be accessible to numerous communities within the United States and Mexico. The alternative is for Brownsville to construct currently authorized off-channel reservoirs which are remote to existing water supply facilities, accessible to only a limited number of municipal users, susceptible to excessive evaporation losses and potential contamination by saline groundwater and provide no benefit to Mexico.

The Project promotes water conservation at the highest level because under current water management conditions, a significant portion of the water flowing into the Lower Rio Grande goes unutilized and flows into the Gulf of Mexico. Absent the Project, the International Boundary Water Commission must release water from Falcon Reservoir up to seven days in advance of the anticipated downstream diversions and needs. If the released water is not diverted due to unexpected reduced demands, mechanical pump failures, or climactic changes, any uncaptured or unused water flows into the Gulf of Mexico. The Weir solves this problem, and, as stated above, it avoids the environmental and cost problems of building an off-site reservoir. The Project is the ultimate water conservation strategy for our region and can conserve more water than any other alternative available. Every acre foot of water conserved by the Project will result in an unreleased acre foot of water remaining in storage behind Falcon Dam for the benefit of all downstream users, municipalities, industries and agriculture.

The Project has the strong support of the State of Texas. In fact, the Texas Water Development Board has incorporated the Project as its top priority in the current Texas Water Plan. There is also written support from City of Matamoros, Mexico and from the Mexican State of Tamaulipas. In addition, the Project has the broad

support of local governments, citizens, and, increasingly, local environmental organizations. For the record, we have attached a list of the many individuals and groups that have expressed support for the Brownsville Weir and Reservoir Project.

We cannot build the Project without federal environmental funding assistance. The Brownsville Public Utility has spent \$3 million on hydrology and preliminary environmental studies for this project. As a multi-jurisdictional bi-national effort, we need one source of funding for this initial design and engineering phase. This is exactly the type of project that the Border Environmental Infrastructure Fund (BEIF) was designed to help, but we have found that in order to move this project along in a timely manner, there must be Congressional direction given on the expenditure of the funding in the appropriations bill. We believe that EPA, NADBANK and the Border Environment Cooperation Commission staff agree that a Congressionally mandated provision is the most effective approach. Thus, we are asking you to earmark \$3.5 million out of the BEIF \$100 million in funding requested by the Administration.

Thank you again for your kind support. This Committee has already done more to assure a long term water supply for the over 500,000 persons in the South Rio Grande area than any other organization or resource. We urge you again to assist us in completing the engineering and design for the Weir.

PREPARED STATEMENT OF THE CALIFORNIA INDUSTRY AND GOVERNMENT COALITION
ON PM-10/PM-2.5

Mr. Chairman and Members of the Subcommittee: On behalf of the California Industry and Government Coalition on PM-10/PM-2.5, we are pleased to submit this statement for the record in support of our fiscal year 2000 funding request of \$1.25 million in the EPA budget for the California San Joaquin Valley Regional PM-10/PM-2.5 Air Quality Study.

The San Joaquin Valley of California and surrounding regions exceed both state and federal clean air standards for small particulate matter, designated PM-10/PM-2.5. The 1990 federal Clean Air Act Amendments require these areas to attain federal PM-10/PM-2.5 standards by December 31, 2001. Attainment of these standards requires effective and equitable distribution of pollution controls that cannot be determined without a major study of this issue.

According to EPA and the California Air Resources Board, existing research data show that air quality caused by the PM-10/PM-2.5 problem has the potential to threaten the health of more than 3 million people living in the region, reduce visibility, and impact negatively on the quality of life. Unless the causes, effects and problems associated with PM-10/PM-2.5 are better addressed and understood, many industries will suffer due to production and transportation problems, diminishing natural resources, and increasing costs of fighting a problem that begs for a soundly researched solution.

PM-10/PM-2.5 problems stem from a variety of industry and other sources, and they are a significant problem in the areas that are characteristic of much of California. Typical PM-10/PM-2.5 sources are dust stirred up by vehicles on unpaved roads, and dirt loosened and carried by wind during cultivation of agricultural land. Soil erosion through wind and other agents also leads to aggravation of PM-10/PM-2.5 air pollution problems.

The importance of this study on PM-10/PM-2.5 is underscored by the need for more information on how the federal Clean Air Act Amendments standards can be met effectively by the business community, as well as by agencies of federal, state and local government whose activities contribute to the problem, and who are subject to the requirements of Title V of the Clean Air Act. There is a void in our current understanding of the amount and impact each source of PM-10/PM-2.5 actually contributes to the overall problem. Without a better understanding and more information—which this study would provide—industry and government will be unable to develop an effective attainment plan and control measures.

Our Coalition is working diligently to be a part of the effort to solve this major problem, but to do so, we need federal assistance to support research and efforts to deal effectively with what is essentially an unfunded federal mandate.

Numerous industries, in concert with the State of California and local governmental entities, are attempting to do our part, and we come to the appropriations process to request assistance in obtaining a fair federal share of financial support for this important research effort. In 1990, our Coalition joined forces to undertake a study essential to the development of an effective attainment plan and effective control measures for the San Joaquin Valley of California. This unique cooperative partnership involving federal, state and local government, as well as private indus-

try, has raised more than \$24 million to date to fund research and planning for a comprehensive PM-10/PM-2.5 air quality study. Our cooperative effort on this issue continues, and our hope is that private industry and federal, state and local governments will be able to raise the final \$4.6 million needed to complete the funding for this important study.

To date, this study project has benefited from federal funding provided through EPA's, DOT's, DOD's, USDA's, and Interior's budgets—a total of \$13.3 million in federal funding, including \$7.6 million in EPA appropriations. State and industry funding has matched this amount virtually dollar for dollar.

With the planning phase of the California Regional PM-10/PM-2.5 Air Quality Study complete, a number of significant accomplishments have been achieved. These interim products have not only provided guidance for completion of the remainder of the Study and crucial information for near-term regulatory planning, they have also produced preliminary findings which are significant to the Environmental Protection Agency's (EPA) interests.

The Study is significant to EPA interests for a number of reasons. The San Joaquin Valley experiences some of the most severe PM episodes in the nation. The Valley is currently classified as one of five serious PM-10 non-attainment areas, and is likely to exceed both the new annual and 24-hour national ambient air quality standards (NAAQS) for PM-2.5. Exceedances of the PM-10 and PM-2.5 standards span many seasons and are influenced by a broad cross-section of sources. The information being collected by the PM study is essential for development of sound and cost-effective control plans. A number of the Study work products however will also have applicability to other areas of the nation. Products such as evaluation of monitoring methods and improved air quality and meteorological modeling techniques will assist the EPA in addressing PM non-attainment problems in areas outside of California as well.

To this end, the PM study is expending significant resources to provide an improved understanding of the nature and causes of PM exceedances within the San Joaquin Valley and surrounding regions. One of the major recent efforts was a preliminary field monitoring program that was conducted during the fall and winter of 1995/96. Extensive air quality, meteorological, and fog measurements were collected. This database is being analyzed to address a number of questions including: (1) the sources contributing to elevated PM-10 and PM-2.5 concentrations, (2) the zone of influence of specific sources, (3) the spatial representativeness of a monitoring site, (4) the adequacy of current monitoring methods, and (5) wind flow patterns and transport routes between the Valley and surrounding areas. The database produced as a part of this study is unparalleled in the nation, and results from the study are already providing a substantive base of understanding about PM-2.5. Preliminary results indicate that PM-2.5 constitutes 70 percent to 80 percent of the PM-10 mass during the wintertime. Secondary ammonium nitrate is often the largest fraction of PM-2.5 mass, and concentrations of ammonium nitrate tend to be very uniform throughout the study region. Site to site variability in PM-2.5 mass is primarily due to local variations in carbon, superimposed on the regional background of ammonium nitrate.

The results of these analyses are being used to design large scale field monitoring programs to be conducted in 1999 and 2000. These field programs will address both the annual and 24-hour PM-10 and PM-2.5 standard. Surface and aloft monitoring of air quality, meteorology, fog, and visibility will be conducted at a cost of over \$12 million. Final plans for these field studies are being developed, which will be carried out by numerous contractors over a broad area encompassing Central California, the Sierra Nevada Mountains, and the Mojave Desert. Substantial resources will also be devoted to developing improved emissions estimates. A database of the field study results will be completed in 2001, with air quality modeling and data analysis findings available in 2002. This timeline is ideally positioned to provide information for federal planning requirements as a part of the new PM-10/PM-2.5 NAAQS.

The Environmental Protection Agency's prior funding and strong support for the Study have enabled projects to occur. Continued support by EPA is essential to implement the major field programs and subsequent modeling and data analysis and ensure that effective control can be developed to meet the PM-10 and PM-2.5 NAAQS.

For fiscal year 2000 our Coalition is seeking \$1.25 million in federal funding through the U.S. Environmental Protection Agency to support continuation of this vital study in California. We respectfully request that the Appropriations Subcommittee on VA, HUD and Independent Agencies provided this additional amount in the EPA appropriation for fiscal year 2000 and that report language be included directing the full amount for California. This will represent the final year of funding requested from EPA.

The San Joaquin Valley PM-10/PM-2.5 study will not only provide this vital information for a region identified as having particularly acute PM-10/PM-2.5 problems, it will also serve as a model for other regions of the country that are experiencing similar problems. The results of this study will provide improved methods and tools for air quality monitoring, emission estimations, and effective control strategies nationwide. Consequently, the beneficial results of this study will contribute to national policy concerns as well.

The Coalition appreciates the Subcommittee's consideration of this request for a fiscal year 2000 appropriation of \$1.25 million for EPA to support the San Joaquin Valley Region PM-10/PM-2.5 Air Quality Study. EPA's past contributions have helped ensure the success of the study. The coalition thanks you for your support of this important program.

PREPARED STATEMENT OF THE UNIVERSITY OF MIAMI

Mr. Chairman and Members of the Subcommittee, I appreciate the opportunity to submit testimony on behalf of the University of Miami. The University is seeking your support for several important initiatives within your purview, through the Army Corps of Engineers, the Environmental Protection Agency, and the National Aeronautics and Space Administration. It is our firm belief, Mr. Chairman, that these projects can provide substantial benefit to the nation.

Headquartered at the University of Miami, the Rosenstiel School is recognized as one of the premier academic oceanographic research facilities in the world. Located on a 16-acre tract on Virginia Key in Miami's Biscayne Bay, the Rosenstiel School provides the only sub-tropical marine research facility in the continental United States. It located adjacent to and coordinates daily with the national NOAA lab and research facility. Also, the Rosenstiel School because of its unique location—the Gulf Stream is immediately offshore; just to the south lies a vast expanse of the only living coral reef off the shores of the continental United States; and just to the east the Florida-Bahamas Carbonate Platform—is a unique resource for the nation, as well as for Florida and the southeast region.

There are close to 100 recognized scientists, researchers, and educators at the Rosenstiel School who collaborate closely with other Florida institutions and whose distinct expertise is vital in addressing critical national, regional, and Florida natural, environmental, and climatic challenges.

The Rosenstiel School has long been recognized as a major national research institute focusing on the living coral reef as a unique and critical national and international resource, critical to the vitality and health of the marine life and coastal marine environment of Florida and the southeast. Florida's coral reefs are the only living coral reefs off the continental United States. The environmental, climatic and man-made challenges to and stress on these precious resources are extensive. To preserve and protect our reefs requires the organization and coordination of the broadest range of talent and resources.

Coral reefs are the only ecosystems on Earth constructed entirely by the secretions of a complex assembly of marine animals and plants. They are economically important resources to humans as sources of food, medicinals, building materials, and coastal protection. They are especially invaluable, in our increasingly crowded world, for the spiritual relief they provide the millions of people that journey to visit them each year. Unfortunately, changes in water quality due to coastal development, environmental changes potentially related to global climate change, and over-exploitation of coral reef fisheries resources, are contributing to world-wide coral reef deterioration at an alarming pace, especially in the Caribbean region. U.S. coral reefs in Florida are down-stream of the entire Caribbean coral reef system, and are thus dependent on Caribbean reefs for larval recruits and maintenance of fisheries stocks. Florida reefs could also be affected by pollutants released into marine waters by nations in the region, and from our own rivers via discharge into the Gulf of Mexico.

Symptoms of deterioration are manifested by losses in coral diversity and percent cover, increases in the biomass of fleshy seaweeds, and the absence of larger predatory fishes and invertebrates. In some cases it is simple to determine the immediate cause(s) of these ecosystem changes [and their solution]. But with increasing frequency, these changes are being found at locations distant from human populations of any size, and we do not know enough to discriminate between the effects of far-reaching anthropogenic activities and natural processes. Scientists are hampered in helping government make critical and socially difficult management decisions by our rudimentary understanding of coral reef ecosystem processes. U.S. coral reef research has historically been piece-meal and under-funded, with few attempts at

interdisciplinary, process-oriented research. Synthesis of existing information to produce new approaches for process-oriented research is greatly needed, but the means to bring appropriate groups of scientists together does not exist in the U.S.A. In this regard the United States of America lags behind other nations, such as Australia, that are stewards of major coral reef resources. As the most developed country in the region, the U.S. must a role of leadership in coral reef conservation and research in the Caribbean.

The National Center for Atlantic and Caribbean Coral Reef Research seeks to coordinate U.S. coral reef policy and research, and assemble major national and international initiatives pertaining to coral reefs. The Center fosters organization and collaboration within the U.S. scientific community, leads the development of a new level of understanding of the processes and environmental conditions necessary for the establishment, survival and sustainable use of coral reef ecosystems public.

We seek to continue the support provided last year through the Environmental Protection Agency for the National Center for Atlantic and Caribbean Coral Reef Research. We have launched a targeted and broadly constructed southeastern regional focus that can parallel and complement the well-funded and structured approach the Congress has established in the state of Hawaii. The long-term implementation strategy involves all of the core Florida institutions and agencies already working, along with the Rosenstiel School, on one or more components of the overall reef challenge. For fiscal year 2000, we request \$2 million from the Subcommittee through the Environmental Protection Agency to continue the implementation and expand the reach of this vital coral reef research program.

Also through the Environmental Protection Agency, the University of Miami's Rosenstiel School of Marine and Atmospheric Sciences and its School of Medicine seek to establish a Joint Center for Pediatric Asthma and Respiratory Disease. The objective is to establish a center for the Southern United States to conduct, promote, and support research into the effects of ambient particulate matter (PM) and other airborne constituents on human health to formulate future environmental regulations with a strong scientific foundation.

The Center will focus on airborne-particle/health issues in the southeastern United States—a region that is subjected to a wide range of airborne pollutant impacts. The levels of ozone and oxidants are seasonably very high over large regions and the rate of noncompliance with the ozone standards is increasing, resulting in a number of large-scale, atmospheric, chemistry/pollution studies. Populations in coastal regions are impacted by other types of particles whose health-related properties have not been well characterized or understood, including the impact of wind-blown sea-salt; marine toxins, bacteria, and various marine micro-organisms. The Center will also provide expertise on matters relating to air quality and human health in the Southeastern U.S.

There are seven specific objectives of the proposed research that will test the hypothesis that exposure to ambient (indoor and outdoor) PM significantly affects the cardiopulmonary response of susceptible populations of children and seniors. The Center activities involve the participation of many different groups associated with six different institutions, the activities of which are organized into research themes.

Through the Rosenstiel School, the School of Medicine and a partnership with other institutions, the Joint Center for Pediatric Asthma and Respiratory Disease will provide a broad-base of expertise in atmospheric chemistry (indoor and outdoor), exposure assessment, cardiopulmonary medicine, epidemiology and public health. We are seeking \$2 million through the Environmental Protection Agency for this important scientific and medical initiative.

Next, Mr. Chairman, my colleagues are seeking to use Synthetic Aperture Radar (SAR), a powerful remote sensing system operating at microwave frequencies where the atmospheric transmission is high. SAR is able to operate in all weather, day or night and, because SAR artificially synthesizes an aperture or antenna which is hundred of meters long in space, it will provide multi-parameter high-resolution observations in the microwave spectrum.

Space-based satellite SAR systems are able to monitor the movement of targets on land and ocean in near real-time, map topography with unprecedented accuracy, access storm and flood damage to urban and rural infrastructure. SARs provide data that can be used to forecast major volcanic eruptions and understand the earthquake process, and a host of other civilian, and scientific applications.

Unfortunately, the current infrastructure in South Florida precludes most of these applications. Florida lacks its own ground receiving station, so even though satellites frequently pass over targets of interest, the data must be downlinked to a station in either Canada or Oklahoma. This downlink request must be made months in advance, as large numbers of users are requesting time on a limited facility. It

takes so long to obtain and process raw SAR data into a usable image that the “window of opportunity” is usually lost by the time the data are ready.

The University of Miami uses SAR data for a variety of terrestrial and oceanographic applications, and has a large amount of experience in the analysis and use of SAR data, and expertise in the operation of satellite downlink facilities. The proposed ground station would greatly enhance SAR-based research and operational monitoring in the Caribbean Basin and Gulf of Mexico. Through this partnership a broad range of terrestrial and oceanographic research, civil monitoring, and other applications research would provide vital information for the region.

We propose that Subcommittee provide \$3 million through NASA so that the agency and the University of Miami can cooperate in the construction and operation of a SAR ground facility, the Advanced Tropical Remote Sensing Center of the National Center for Tropical Remote Sensing Applications and Resources. This unique facility would be located at the former Richmond VLBI site, a secure facility with good satellite visibility.

Finally, Mr. Chairman, we ask that you consider a joint request from the University of Miami and the City of Miami Beach, Florida to support an effort to counter coastal erosion along the southeast Florida coast. The effects of coastal erosion in South Florida are acute. Replenishing our beaches—an economic necessity—consumes millions of dollars annually. The Rosenstiel School is seeking to determine cost-effective methods for halting the coastal erosion process. Our scientists are joining the ongoing effort of the City of Miami Beach to establish an innovative demonstration project which would enhance continuous beach erosion prevention efforts and establish an effective sand recycling system. For fiscal year 2000, the Rosenstiel School seeks \$2 million through the U.S. Army Corps of Engineers for this important effort.

Mr. Chairman, we understand how difficult year this will be for you and the Subcommittee. However, we respectfully request that you give serious consideration to these vital initiatives. All of them have great implications and will provide exceptional benefits to the well-being of the nation.

Thank you for allowing me to appear here today.

PREPARED STATEMENT OF THE AMERICAN SOCIETY FOR MICROBIOLOGY

The American Society for Microbiology (ASM), the largest single life science organization in the world, comprising more than 43,000 members, welcomes the opportunity to testify before the Senate Appropriations Subcommittee on VA, HUD and Independent Agencies and provide comments and recommendations for the fiscal year 2000 appropriations for the scientific research programs within the United States Environmental Protection Agency (EPA) and the National Science Foundation (NSF).

The ASM is comprised of scientists who work in academic, governmental and industrial institutions worldwide. Microbiologists are involved in research on problems related to human health, the environment and agriculture. The mission of ASM is to enhance the science of microbiology to gain a better understanding of basic life processes, and to promote the application of this knowledge for improved health, and for economic and environmental well being.

The NSF provides the main source of funding for scientists in the United working in many areas of biological research. Programs supported by the NSF are critical to microbiologists, especially as they relate to the exploration of biodiversity and the roles of microorganisms in global biogeochemical cycling reactions that maintain the environmental quality of the earth. The EPA also funds important basic research activities in focused areas related to the agency's mission of protecting the environment. This testimony will outline the ASM's funding recommendations for both the EPA and NSF research and development programs for fiscal year 2000.

ENVIRONMENTAL PROTECTION AGENCY

The EPA's scientific research and development programs are of interest to many of ASM's members who work in the fields of applied and environmental microbiology. Research on environmental microbiology is essential for maintaining air, water, and soil quality; for assuring the safety of potable water supplies; and for providing safe means for waste disposal. Support of applied research in the field of environmental microbiology can lead to enhanced environmental quality and help protect human health. The ASM believes that sound public policy for environmental protection depends on adequately funded programs of intramural and extramural research based on a system of peer review to assure that support is awarded to research programs having both quality and relevance. The EPA, which has partnered

with the NSF in recent years for peer review of some extramural research programs, has begun its own peer review system based upon the NSF model. Critical peer review of both the intramural and extramural research programs of the EPA are necessary for ensuring the quality and scientific validity of studies that are funded.

Science to achieve results program

The EPA's Science to Achieve Results (STAR) program is an important mission-driven, extramural research initiative. This program is targeted to receive \$110 million for fiscal year 2000, a \$14 million increase over last year's budget of about \$96 million. This program funds important environmental research proposals from scientists outside the federal government and is a valuable resource for the EPA in finding solutions to many of the complex environmental problems we face today. Grants made under the STAR program last from two to three years and provide about \$150,000 of scientific support per grant year. The STAR program funds projects in specific focal areas including drinking water, ecology of harmful algal blooms, water and watersheds, ecological indicators, and pollution prevention, which have significant microbiological components. The ASM urges the Congress to fully fund the STAR program at the requested level of \$110 million. ASM is concerned, however, that the exploratory grants program, as opposed to targeted RFAs, has dropped to only 10 percent of the STAR budget. This portion is too small to meet the many needs within EPA's mission that are not targeted in a limited number of RFAs.

Clean and safe water

The ASM supports the Administration's request of \$3.4 billion for Clean and Safe Water. The ASM applauds the EPA's support of such program initiatives as drinking water safety standards, cost-effective water treatment technologies focusing on microbes, improved water safety guidelines and pollution indicators, and a federal database of beach advisories and closings across the United States. ASM also supports the EPA Research Plan for Microbial Pathogens and Disinfection By-Products in Drinking Water focusing on *Cryptosporidium* and *Giardia* and urges Congress to ensure that adequate funding is secured from within the \$41.5 million, targeted for Safe Drinking Water Research, to allow this plan to be carried out. In addition, the ASM believes that the next step in this research plan should be to focus on additional pathogens such as microsporidia and *Helicobacter pylori*. ASM strongly believes that there should be improved coordination among several federal and state agencies in dealing with microbial pollutants in the nation's drinking and recreational water.

Graduate environmental fellowship program

The ASM urges Congress to fully fund the EPA's Graduate Fellowship Program at the requested level of \$10 million for fiscal year 2000. The EPA's Graduate Environmental Fellowship Program is one of the many initiatives the federal government must fully support to ensure that the nation is prepared to answer the complex scientific questions of the future. Both the public and private sectors will benefit from a steady stream of well-trained environmental specialists. The fellowship program has had a major impact in attracting exceptionally talented young people to pursue careers in environmentally related fields. With environmental challenges facing the nation including cleaning up toxic waste, ensuring cleaner air and water, and providing safe drinking water, there is a clear need for highly skilled, well-trained environmental experts to find solutions to these pressing issues. However, it is essential that once EPA receives funding for this important program, the agency support fellowships in areas related to microbial risks in the environment including water quality and bioremediation technologies to clean up toxic waste.

NATIONAL SCIENCE FOUNDATION

The ASM, a member of the Coalition for National Science Funding (CNSF), supports the coalition's recommendation to provide the NSF with an increase of \$562 million or 15 percent over its fiscal year 1999 funding level. This would raise the NSF's overall budget from \$3.773 billion in fiscal year 1999 to \$4.335 billion in fiscal year 2000. NSF's mission is to promote and advance scientific, mathematical, and engineering research and education in the United States by funding the highest quality academic research and education programs. A 15 percent increase would enable NSF to support additional excellent research projects in pursuit of important discoveries and innovations. Enhanced support for the NSF's efforts to improve education will help expand our nation's intellectual capital. Strong links between research and education are essential to a healthy research enterprise, an educated public, and a well trained future workforce.

Microorganisms surround us and affect our lives in many ways. They play key roles in processing our wastes, recycling the nutrients that support our agriculture, forests and fisheries, yield new pharmaceuticals, provide key tools for biotechnology, affect the quality of our food and water, control some pests (biocontrol), and cause disease. NSF is to be complimented for recognizing a few years ago the important role microorganisms play in our well-being and in opportunities for basic science advances through its Microbial Biology initiative. This led to new programs such as LExEN (Life in Extreme Environments), Microbial Observatories which focus on the discovery of important but uncultured microorganisms, and the first Biocomplexity Program which is focused on microbially-based ecosystems. ASM applauds these new initiatives. Microorganisms do present very different types of research challenges and opportunities than those for macroorganisms. Hence we encourage NSF to maintain its momentum in Microbial Biology programming to ensure that basic discoveries for this group of organisms is realized.

New advances in science have provided new opportunities and needs in microbiology research which should be considered in NSF programming. These areas are the following.

Genomics research

More than 20 microbial genomes have now been completely sequenced and many more are underway. This information fundamentally changes the approach to research and what can be learned about an organism. Microorganisms, being the simplest forms of life, are the first in which the roles of all genes can potentially be understood. To maximize the value of the genome sequencing effort, NSF should expand its research in functional genomics and associated genomic areas. This should extend beyond the more obvious areas of molecular biology and genetics to the areas of ecology, taxonomy and population biology for example, so that the value of genomics is more fully realized. ASM strongly endorses NSF's functional genomics research under its Division of Molecular and Cellular Biosciences (MCB) and encourages the Division of Environmental Biology (DEB) to more aggressively encourage genomics technology to be used in their research. The ecological and population fields hold great opportunities for a more comprehensive understanding of the genome and hence cutting-edge advances to understanding biology.

Microbial biodiversity

Only a few percent of the microorganisms on earth are known, leaving microorganisms as the largest untapped source of biodiversity. New drugs, enzymes, biocontrol and bioremediation agents are examples of the economic potential in the discovery of this biodiversity. The NSF's Microbial Observatories Program is focused on observing, recovering, and understanding microbes in diverse environments and is an important introductory effort towards this goal. Efforts are also needed to advance the systematic, ecological, biochemical, and evolutionary understanding of particularly unique, newly discovered microbes as well as new strategies to recover more difficult to culture organisms. The tremendous opportunity in microbial diversity discovery will hopefully be realized under NSF's proposed initiative on discovery of new species and builds on the President's Committee of Advisors on Science and Technology (PCAST) Report, "Teaming With Life". ASM strongly supports this initiative.

Microbial systematics and databases

Microbial systematics research has not kept pace with research and application needs. Organism characterization is key to a proper taxonomy which in turn is vital to efficient research as well as to a host of application sectors such as proper diagnosis of diseases, quality control of a variety of products, safety of our foods and waters, patent descriptions and novel biotechnologies. Advances in molecular techniques have revolutionized our understanding of the relationships among microorganisms and provided new tools for more specific and rapid identification of microorganisms. The proper systematic study of many important microorganisms is needed to underpin much of the microbial research and its application. NSF is the appropriate agency to support microbial systematics research on the many organisms that do not cause human disease. We ask that NSF address this fundamental gap in microbial knowledge in its future programming.

Because of the small size of microorganisms, information of all types, including sequence, phenotype, function, chemistry and habitat is needed to efficiently understand and identify an organism. The jobs of the many practitioners of microbiology would be more efficient if microbial data were available in an integrated electronic database and new insight about the most numerous organisms in our universe could be more readily realized. NSF needs to recognize that biological databases, such as microbial databases, are a central and vital infrastructure need to modern day bio-

logical research and should be treated as a central national facility. NSF's information technology programs (IT) appear to also provide for advances useful in future biology research, including microbiology. With more intensive and extensive data, we need better ways to analyze, visualize and compute the information. ASM looks forward to the benefits from IT and IT².

Members of the ASM, whose activities include research concerned with the impact of microorganisms on the well-being of humans, animals, plants, and the environment, are very supportive of NSF's increased focus on microbial biology and the diversity of microorganisms, an initiative begun in fiscal year 1996 under the auspices of the NSF's Directorate for Biological Sciences (BIO). For years, research efforts have concentrated on the study of microbes in human and animal health. The unknown microbial biomass provides opportunities to discover new knowledge about microbial life forms and their potential application in industry, medicine and agriculture. In addition, microbiological research continues to provide the foundation for today's advances in biotechnology. These advances are based on understanding the molecular basis of microbial physiology and the genetics of viral, yeast and bacterial plasmid vectors. Future accomplishments and their application to increased agricultural productivity (an important by-product of biotechnology) will not be possible without NSF funded basic research.

The NSF is one of the few government agencies that support fundamental basic research. United States leadership in science and technology is dependent on sufficient funding for basic research. Most of today's scientific achievements in areas such as bioremediation, technology to clean up oil spills and industrial pollution, the development of new antibiotics and drugs, biopesticides, and biotechnology all have their roots in basic research. The many future public health and environmental challenges the United States will face can only be overcome through the potential of basic research to generate crucial new scientific knowledge and advancements that lead to new technologies for the future.

Mr. Chairman, on behalf of the American Society for Microbiology, thank you for the opportunity to submit testify to your Committee on the fiscal year 2000 appropriations for the EPA and the NSF. I would be pleased to answer any questions from you in writing at a later date.

PREPARED STATEMENT OF THE STATE AGRICULTURAL EXPERIMENT STATIONS AND
STATE EXTENSION SERVICE

Mr. Chairman, members of the subcommittee: On behalf of the members of the State Agricultural Experiment Stations (SAES) and State Extension Service (ES), we as chairs of the Experiment Station Committee on Organization and Policy (ESCOP) and Extension Committee on Organization and Policy (ECOP) appreciate the opportunity to appear before you to discuss the importance of research, extension, and education in environmental and natural resource programs. ESCOP and ECOP are non-profit organizations representing a partnership that includes the SAES and the USDA-Cooperative State Research, Education, and Extension Service (CSREES).

A primary goal of these organizations is to broaden the partnerships with other agencies involved in environmental and natural resource management programs and research. These organizations are committed to improving environmental decision making at the local level by capitalizing on the comparative advantages in research, education, and extension that the Land Grant Universities (LGU) can provide. In working with federal agencies ESCOP and ECOP aim to focus additional attention on the national environmental research agenda and to attract new resources for environmental research activities conducted through LGU programs. Furthermore, our LGU institutions have a critical mass of scientific infrastructure and facilities and a history of long-range research.

ESCOP and ECOPs major focus in the areas of environment and natural resources include:

- Environmental modeling and forecasting (e.g., carbon sequestration);
- Water and watershed management (e.g., nutrient/waste management);
- Land-use planning and management (e.g., community-based environmental protection);
- Environmentally and economically sound agriculture (e.g., precision agriculture); and
- Environmental education and outreach.

PARTNERING WITH OTHER AGENCIES

ESCOP and ECOP share similar research priorities and goals as other agencies, such as EPA. Although many initiatives target specific agendas, a thorough inventory of research priorities and pooling of resources can be achieved through collaborative discussions. In recognition of these similarities, many agencies have targeted program areas for pooling resources to address these common initiatives and programs. One such organization to unfold in these efforts links the organizational structure of the SAES and USDA-CSREES into a national environmental initiative. A primary goal of this initiative, named SUNEI (SAES/USDA-CSREES National Environmental Initiative) is to facilitate teaching, research, and extension activities in the environmental sciences as they relate to agriculture and natural resource issues through traditional and new federal-state partnerships. This organization is committed to improving environmental decision making at the local level by capitalizing on the partnerships at the national level.

ESCOP & ECOP promote LGU partnerships with EPA and other agencies that will increase:

- the exchange of scientists between LGU institutions and Agencies for collaborative projects.
- the amount of LGU participation in Agency peer review processes;
- the quantity/quality of proposals submitted by the LGUs for Agency funded competitive grants
- the number of funding awards from agencies going to LGUs;

EXAMPLES OF COLLABORATION

Recently USDA and EPA joined efforts to draft the Unified Strategy for Animal Feeding Operations (AFOs). ESCOP & EPA applaud these agencies for their collaborative efforts. It is this and similar efforts which make meaningful partnerships. The nation is eager to see implementation of voluntary policies, which establish incentives to change or modify management practices. This Unified Strategy will protect and preserve the priceless assets of our nation's water resources in our coastal, surface, and groundwater. EPA has developed competitive funding programs to address waste management that are multidisciplinary and multistate driven. Programs such as this, which are aimed at protecting the quantity and quality of our water in the face of increased demands from population growth, should continue to be encouraged by decision makers at the national level. This institutional support by the various agencies solidifies and provides incentives for local level resource managers from different agencies to work together with local producers and state level nutrient managers.

ROLE OF COOPERATIVE EXTENSION

Under the AFO Strategy, we are pleased to see that USDA and EPA have identified Cooperative Extension Specialists as qualified nutrient management planners to assist owners/operators in meeting requirements. Our university system accommodates rapid advances in information technologies to extend outreach and education programs which are based on sound research and understanding of the public learning process. The LGU system offers a full environmental portfolio in its research, education, and extension programs, and provides the technical innovation and new management ideas to implement sound nutrient management plans. Therefore, LGUs can serve as a valuable resource when developing standards and providing technology transfer to owners and operators who manage production facilities in our nation's watersheds.

OFFICE OF RESEARCH AND DEVELOPMENT

EPA's Office of Research and Development (ORD) has demonstrated a strong commitment in working with the LGU System. In 1996, ORD policy makers held a workshop for LGU and EPA officials to discuss common research priorities and agendas. ECOP and ESCOP would like to encourage a strong continued commitment by ORD to collaborate with universities through a variety of competitive grants, investigator-initiative exploratory research grants, personnel exchanges, graduate fellowships, and environmental research centers.

Overall, the LGU System appreciates and supports the continuation of the Science To Achieve Results (STAR) program to fund core and problem solving research. In particular, the joint Water and Watershed Research program has provided increased opportunities for LGU scientists to submit proposals, participate within the ORD peer review process, and obtain needed funding to engage in watershed research programs. One EPA priority, Integrated Ecological Economic Modeling and Valu-

ation of Watersheds, will assess the impact of future land use—such as agriculture, forestry, and urban development—on the watershed. Under this project, LGU faculty could provide valuable research and extension capacity to EPA by educating local decision-makers with the sound scientific information on the impacts of different land use strategies on water quality.

Human activity has arguably caused changes to the earth's ecology in ways that threaten sustained agricultural and forestry production. Elevated levels of carbon dioxide from the burning of fossil fuels, increased exposure of crops and livestock to harmful Ultra Violet-B radiation, and the unknown consequences of elevated temperatures on crop, forest, and livestock production are just some of the emerging concerns for global changes on food and fiber production. ECOP and ESCOP realize that EPA is one of the many contributing agencies to the U.S. Global Change Research Program (USGCRP). We encourage USGCRP studies that not only investigate the impacts of global change on the environment and economy, but also research to develop the core science knowledge about the carbon cycle and how problem-oriented research can help mitigate excessive levels of CO₂ and develop agriculturally-based remediation methods for the changing global environment.

SOUND SCIENCE BASED-REGULATIONS

One of the critical issues that ECOP and ESCOP would like to address is the need for sound-science based regulations. Both the Unified Animal Feeding Operation (AFO) Unified Strategy and the Food Quality Protection Action (FQPA) have the potential to dramatically change the way agricultural and natural resource managers do business. The Land-Grant community is therefore very concerned that the EPA engage in credible research and outreach endeavors that provide a sensible background for any major regulations that may negatively impact agricultural producers during this "farm crisis."

LGUs encourage USDA and EPA to collaborate on the Integrated Risk Information System (IRIS). It is very important that the public is aware and educated about true risks of chemicals and contaminants, rather than purely reacting to perceptions of danger. Therefore, LGUs are supportive of EPA-ORD's Goal 8 for Sound Science. One area for emerging risk research is endocrine disrupters which ORD addresses under Goal 8. This is another example for potential participatory research by land-grant scientists with EPA's STAR Exploratory Grants program, since agricultural and natural resource faculty provide critical expertise in studying the effects of agricultural chemicals and fertilizers on endocrine disrupters.

THE SYNERGISTIC EFFECT OF INTERDISCIPLINARY RESEARCH AND EDUCATION

LGUs have an interdisciplinary mix of persons to address complex interdependencies of environmental systems. LGUs also integrate research and education. Thus, they can apply new knowledge to solve environmental problems in the field and improve the rate of adoption of new technologies. In particular, the Land-Grant community has existing capacity, expertise, and resources dedicated in the following areas that are consistent with ORD's over all goals for advanced integrated ecosystem monitoring and analysis.

Water and watershed management including:

- Nutrient management
- Harmful algal Blooms
- Animal waste management

Land-use planning and management including:

- Riparian/buffer zones
- Coastal zone management
- Sustainable development/openspace/conservation

Environmentally and economically sound agriculture including:

- Integrated pest management
- Alternative pest management and sustainable agriculture
- Precision agriculture/forestry/range

Environmental modeling, monitoring, and forecasting including:

- Natural disasters and hazards
- Climate change (especially, carbon sequestration)
- Bio-fuels and renewable resources

Environmental education and outreach including:

- Improved environmental decision-making at the local level community based environmental protection (CBEP)
- Geospatial and land-use extension specialists
- AFO-nutrient management planning assistance

ECOP and ESCOP also encourage EPA-ORD to work collaboratively with other federal agencies on environmental challenges in the future and with existing projects including:

- USDA-CSREES/National Research Initiative on basic environmental science questions;
- USDA-CSREES on integrated research and education needs and opportunities in the environmental area;
- The National Science Foundation, USDA-CSREES, and others on the joint Waters and Watersheds research program; and
- NOAA, NASA and others on the ECOHAB research program.

The Administrator of ORD, Norine Noonan stated that ORD intends to “work smart” by leveraging our investments in all of this work through expanded partnerships with stakeholders in both the public and private sector.” ESCOP especially appreciates ORD’s willingness to collaborate with other federal agencies to better coordinate national priorities, reduce redundancy, and leverage resources. Under the Integrated Science for Ecosystem Challenges (ISEC), the Mid-Atlantic Integrated Assessment (MAIA), and the Coastal Initiative, EPA has a demonstrated need for geographically distributed monitoring and continuity of data. LGUs are logical partners to meet the needs of a geographically distributed environmental monitoring network (i.e., coastal and estuary water quality) and consistency of long-term data collection. This is one area where SUNEI may encourage new federal-state partnershiping.

ADDITIONAL COLLABORATION

ESCOP and ECOP continue to build its relationships with various other agencies such as DOE, NASA, NOAA, and NSF in support of the nations agricultural and natural resource system. We plan to encourage interagency communication and to broaden the LGUs federal participation within USDA and other agencies. SUNEI also hopes to better unify representatives from the Natural Resource Conservation Service (NRCS), the Forest Service, and the Agricultural Research Service. This goal is aimed at enhancing the collaboration that is occurring at the local level between LGUs and USDA agencies.

The LGUs will continue to provide an “on-the-ground” and “in-the-field” role on environmental and natural resources issues and research. Under ESCOP & ECOP, the SUNEI initiative provides an environmental and natural resource point of contact for Federal agencies to reach the System. Furthermore, through the excellent electronic communications network of the LGU System, the appropriate administrators, scientists, academic program personnel, and extension representatives can be reached almost immediately as circumstances demand.

Mr. Chairman and members of the subcommittee, thank you for the opportunity to testify on behalf of the LGU research, extension and education system. We will continue to build collaborative partners to provide for a sustainable agriculture and natural resource environment. We stand ready to work with you in these efforts.

PREPARED STATEMENT OF THE ASSOCIATED GENERAL CONTRACTORS OF AMERICA

The Associated General Contractors of America (AGC) appreciates the opportunity to submit testimony in strong support of the State Revolving Fund (SRF) programs—the Clean Water State Revolving Fund (CWSRF) and the Drinking Water State Revolving Fund (DWSRF). These two revolving funds, based on assessments taken before they started, have been tremendously successful programs that were established to meet federal mandates.

The 1972 Clean Water Act created a federal grant program that was, in 1987, transformed into the Clean Water State Revolving Fund program to fund the construction and modernization of municipal sewage plants. Low-cost loans are provided to local governments to finance needed facilities. The loans are then repaid and new loans are made from the CWSRF.

The Drinking Water State Revolving Fund originated in the Safe Drinking Water Act Amendments of 1996. The program, which operates like the Clean Water State Revolving Fund, assists public water systems to finance the costs of infrastructure needed to achieve or maintain compliance with the Safe Drinking Water Act requirements and to protect public health.

AGC is proud of the role the construction industry has played in improving water quality. Our members build and rehabilitate the facilities financed by these two programs, both of which have been responsible for significant water quality improvement. Since enactment of the Clean Water Act in 1972, water quality has improved significantly on over 50,000 miles of waterway. Streams and lakes, once devoid of

fish and other aquatic life, now support abundant and varied populations. The foundation for many of these environmental improvements is in the construction grants program and the SRF programs.

The needs, however, are still staggering. In the Environmental Protection Agency's (EPA) first report to Congress in January, 1997 entitled "Drinking Water Infrastructure Needs Survey," the EPA reported that the nation's 55,000 community water systems must invest a minimum of \$138.4 billion over the next 20 years to install, upgrade, or replace the infrastructure. Of this total, \$12.1 billion is needed immediately to meet current Safe Drinking Water Act (SDWA) mandates. The EPA's report is a conservative estimate because many of the systems surveyed were unable to identify all of their needs for the full 20-year period.

In fact, a more complete and independent study released in October of last year by the American Water Works Association (AWWA) found that the capital investment needs for the water supply community over the next 20 years is \$325 billion.¹ The EPA's emphasis in their survey was on identifying the utility investment needed to comply with the federal mandates issued under the Safe Drinking Water Act Amendments (SDWAA), so that Congress could better understand the costs imposed by federal drinking water regulations. The objective of the AWWA investigation, on the other hand, was to examine the longer-term infrastructure investment requirements of U.S. water utilities, regardless of whether they are directed at current or future needs over the twenty-year period.

Even if we use EPA's estimates, the water infrastructure needs are overwhelming. EPA's report indicates that the largest category of need is installation and rehabilitation of transmission and distribution systems—\$77.2 billion. Aging, deteriorating pipes can allow water in the distribution system to become contaminated, leading to illnesses from ingestion of waterborne pathogens as well as interruptions in water service. Most needs in this category involve the extraction and replacement of existing pipe.

The second largest category is treatment, constituting a total 20-year need of \$36.2 billion. Storage needs are the third largest category at \$12.1 billion. The fourth category of need is source rehabilitation and development, estimated at \$11.0 billion. An additional \$1.9 billion in need is categorized as "other."

In addition to the extensive capital needs, the American public is very concerned about water quality and supports the federal government investing in the effort to clean up our water supply. In a recent survey commissioned by the Rebuild America Coalition, 66 percent of the American people from all regions and areas of the country describe spending on America's infrastructure as a "strong investment in America." 74 percent are even willing to pay 1 percent more in taxes if it meant you could guarantee a safe and efficient sewage and water treatment system. The support transcends party lines, carrying overwhelming support from Republicans, Independents and Democrats.

Despite the extensive needs and tremendous support from the American people, President Clinton's fiscal year 2000 budget proposed cutting the Clean Water State Revolving Fund from \$1.35 billion to \$800 million, a \$550 million reduction. It is unthinkable that when needs are so severe President Clinton would cut the funding by 41 percent.

Equally disturbing is a new proposal by Senator Ron Wyden to direct "a significant portion" of the CWSRF funding to promote "smart growth" of cities and suburbs. Senator Wyden has said the plan would "set aside a portion of clean water dollars and then invite applicants to produce creative homegrown solutions to urban sprawl."² With the mounting wastewater needs, it is hardly the time to divert the precious and limited funding from these important state revolving funds. This program is too important to short-change in favor of the latest political campaign fad.

AGC believes that the nation's clean water program should be viewed for what it truly is—an investment in the future health and economic viability of the nation. Each one billion dollars invested in the construction of wastewater facilities generates some 52,000 new jobs. Even more importantly, wastewater treatment creates opportunities for economic development in communities by allowing new industries and new homes to locate there. These facilities are fundamental elements of the nation's environmental infrastructure. At this time, when our global competitors are recognizing the importance of infrastructure as the vital foundation on which future economic growth is based, the United States must provide the needed capital investment to allow our nation to thrive.

¹American Water Works Association: Infrastructure Needs for the Public Water Supply Sector, October, 1998.

²Senator Ron Wyden's comments to the Environmental Media Services news breakfast.

AGC believes in these times of economic prosperity and with the increasing needs in our nation's drinking water and wastewater, now is not the time for the federal government to lessen its commitment to clean water. Toward that end, AGC urges Congress to appropriate stable annual funding of at least \$1.5 billion for the Clean Water State Revolving Fund and \$1.2 billion for the Drinking Water State Revolving Fund.

Again, AGC appreciates the opportunity to submit testimony in support for the two state revolving funds. We look forward to working with you to ensure that the necessary investment is provided to improve the quality of our nation's drinking and wastewater.

FEDERAL EMERGENCY MANAGEMENT AGENCY

PREPARED STATEMENT OF THE ASSOCIATION OF STATE DAM SAFETY OFFICIALS

The Association of State Dam Safety Officials is pleased to have an opportunity to comment on the fiscal year 2000 budget request for the National Dam Safety Program within the Federal Emergency Management Agency.

The Association of State Dam Safety Officials (ASDSO) is an association of over 1,700 federal, state, and local dam safety officials and private sector individuals and was established in 1984 in response to a need for stronger coordination of dam safety programs on state and federal levels. This need was made apparent after several devastating dam failures in the late 1970s focused national attention on the lack of regulatory authority over the safety of these structures. The goal of ASDSO is to save lives, prevent damage to property, and maintain the benefits of dams by preventing failures.

Last year, the Subcommittee supported the National Dam Safety Program to the fullest extent possible as authorized in the Water Resources Development Act of 1996. The total amount was \$2.9 million in fiscal year 1999. This small but vital amount of money took the new National Dam Safety Program into its second year of progress toward improved dam safety nationwide (progress that will be characterized later in this testimony).

But, there is no progress without continued funding. ASDSO, therefore, respectfully requests this Subcommittee's support for the authorized level of \$5.9 million to fully fund the National Dam Safety Program in fiscal year 2000. We would also request that the \$400,000 authorized for staff to administer the Program within FEMA be specifically earmarked for that purpose.

The following activities will be funded through this appropriation:

- \$4 million for incentive grants to state to upgrade their dam safety programs,
- \$500,000 for training state dam safety staff,
- \$1 million for research to improve the techniques and equipment for rapid and effective dam inspections and dam engineering, and
- \$400,000 for salaries and expenses for FEMA to administer the program.

This modest, yet vital funding would help reduce the risks to life and property due to dam failures by providing states with resources to improve their dam safety programs. It is an investment in public safety that will reduce loss of life, property damage and large federal expenditures that are a result of payments for disaster assistance through the Disaster Relief Fund and the National Flood Insurance Program.

DAM SAFETY, REGULATION AND THE EXTENT OF THE HAZARD

According to the National Inventory of Dams housed at the US Army Corps of Engineers, there are approximately 74,935 dams¹ in the United States. Sixty percent of these dams are privately owned. Federal, state and local governments own the other 40 percent.

Dams are an essential part of our national infrastructure. They serve a multitude of functions including the following: Flood control; Hydropower; Water Supply; Fire and Farm Uses; Irrigation; Recreation; Mine Tailings Retention; and Navigation.

But, failures of these structures can affect thousands of lives and cost millions of dollars. Safety is essential to all dams, but most-importantly to the approximately 9,300 dams determined by regulators to be high-hazard, meaning they threaten human life and could cause significant downstream damage should they fail.

Even more significant are the 1,800 dams that are considered unsafe. This means they have deficiencies that leave them more susceptible to failure. Many of these

¹ These are structures meeting the federal definition of a dam. There are still thousands of smaller dams in the United States that are regulated and/or inventoried by the states.

unsafe dams are also high-hazard. Every member of this Subcommittee has high-hazard dams operating within his or her state. Nearly every member on this Subcommittee has an unsafe, high-hazard dam in their state. North Carolina, Pennsylvania and Texas have over 500 high-hazard dams each.

Other state statistics include the following:

	High hazard	Unsafe
Arizona	73	23
Montana	153	13
New Jersey	183	32
West Virginia	248	49

A complete chart of states' dam inventory data is included at the end of this written testimony.

For these reasons, safety regulation is essential to reduce the hazards involved with dams. That responsibility rests almost entirely with the states. States have responsibility for safety regulation over about 95 percent of the nation's dams. The federal government regulates the other 5 percent.

Although many thousands of dams have responsible owners and are maintained safely, there are still many thousands more where the potential for disaster grows as time passes. These dams are deteriorating, downstream development is increasing and owners face rehabilitation costs that they cannot meet.

Furthermore, support for state regulatory programs is lacking in many states. According to the National Inventory of Dams, 35 percent of high-hazard dams have a last inspection date of 1990, when it is generally agreed that high-hazard dams should be inspected every year. (Inspection being a function of a regulatory program.) A handful of states have exemptions in their law leaving thousands of dams not regulated across the nation. Lack of enforcement power in some states has given irresponsible owners the ability to ignore orders to repair their dams or to abandon their dams altogether; leaving a serious safety threat when these structures are determined to be high- or significant-hazard.

COSTS OF DAM FAILURES

It has been said that few man-made structures have the potential for causing catastrophic devastation, as do dams should they fail. Here are some historic examples:

- The Buffalo Creek Dam failure of 1972 killed 125 in West Virginia.
- The Teton Dam failure in 1976 caused the deaths of 14 and \$400 million in property damage.
- The Laurel Run Dam failure in 1977 killed 40 in Pennsylvania
- The Kelly Barnes Dam in Toccoa Falls, Georgia killed 39 and caused \$2.5 million in damages in 1977.
- The Georgia Floods of 1994 caused the failure of over 200 dams and millions of dollars in property damage.

Failures and devastation still occur and threaten lives and property today. According to the National Performance of Dams Program at Stanford University, there were approximately 20 dam failures and about 200 incidents in 1998. Included in the costs for these failures are:

- Emergency evacuation costs
- Downstream property damage
- Clean-up costs
- Loss of dam infrastructure and revenue generated from the dam operation
- Environmental impacts
- Economic losses to nearby communities

SUCCESES OF THE NATIONAL DAM SAFETY PROGRAM

The National Dam Safety Program is currently into its second year. With the funding made available to FEMA, an enormous amount of progress has been made toward improving dam safety.

Thirty-nine states have taken advantage of the training assistance to send state inspectors to needed continuing education courses. Forty-six states received incentive grants in fiscal year 1999 to improve their dam safety programs. Here are some success-stories from these state recipients:

Florida

"Florida is holding a series of simulated failures to test emergency action planning procedures. A part-time data entry person has been hired to update Florida's dam inventory database."

Hawaii

"The Flood Control & Dam Safety Section has expanded by hiring eight new personnel. Hawaii will have a full time person and two part time persons on dam safety. The maintenance crew will also be available for emergency operations. Additionally, a maintenance facility will be constructed."

Kansas

"Thanks in part to the FEMA State Assistance Grant Program, the State of Kansas has begun a regular inspection of all dams that were rated "unsafe" and all dams that are classified as "c" (high) hazard dams. The inspection focuses on ensuring that all these dams meet regulatory requirements pertaining to hydrologic adequacy and that they have acceptable Emergency Action Plans. The department is also enhancing its computer equipment and software to perform its regulatory functions credibly and efficiently."

Kentucky

"Kentucky is coordinating with federal agencies, with jurisdiction over dams in the Commonwealth, to better inform the public of state regulations."

Missouri

"The NDSP funding has allowed the Missouri Program to send 3 engineers to much needed training. The training attended includes a Concrete Rehabilitation Course, HEC-RAS, and a course on how to detect seepage around conduits. Efforts are currently underway to purchase a remote controlled camera to use in inspecting conduits in dams. This is especially important due to the amount of Corrugated Metal Pipe that was used for primary spillways 30 years ago. Much of this pipe is now at the end of its useful life and the pipe has deteriorated to the point that the integrity of the dams is being threatened. Due to the high cost of this type of equipment, purchase of this equipment using the state budget allotment was impossible."

Montana

"Montana put on a Flood Hydrology Seminar on March 30, and 31, 1999 in the state. We used \$3,000 of the \$3,800 available for individual state training needs from the National Dam Safety Act. The seminar was about the flood hydrology techniques used in Montana for spillway design for dams. The seminar included an illustration of the recent USGS extreme storm unit hydrographs and a recent study of runoff parameters."

Nevada

"As a result of the federal grant money given to Nevada, we have purchased a notebook computer. By having the notebook computer in the field, we will now be able to write up our inspection reports at the site so that when the engineer returns to the office, the report can be printed and sent out. We are currently revamping our inspection checklist so that it can be filled out easily on the computer and be ready for mailing. The computer also houses our inventory database and will allow the database fields to be automatically inserted into the inspection forms. Without the federal grant money, there is no way the dam safety section would've gotten a notebook computer to do this type of work. And this is only the tip of the iceberg. We are planning on purchasing an outlet camera so that visual inspections can be done on old, small diameter conduits. The money is helping Nevada's dam safety program immensely."

New York

"New York is receiving \$103,089 in incentive grants from FEMA in fiscal year 1999. Thanks to the training funding, each of the three state inspectors have been able to attend training that they would not have otherwise been able to attend."

North Carolina

"Several state dam safety engineers have been taking advantage of the new training opportunities at Emmitsburg, Maryland and at ASDSO regional workshops."

Washington

"The FEMA assistance money will be used for equipment and a summer intern, improving productivity. It will result in a reduction in the time elapsed between inspections."

West Virginia

West Virginia is receiving \$20,944 from FEMA to improve its dam safety program. Other progress in 1998:

- Eleven states increased the number of dam inspections in 1998 over 1997
- Twelve states increased the number of emergency action plans filed with the state for those dams requiring them
- Six states said they executed quicker turn-around times on issuing permits
- Fifteen states reported improvement in remediation of deficient dams
- Fourteen states said they improved their coordination with state emergency preparedness officials
- Nine states reported better quality technical reviews at dams

CONCLUSION

Dams are a critical part of our national infrastructure. They provide benefits upon which our communities and industries depend. However, safety is essential to the efficient operation of the dam and to the people and property surrounding the structure. Safety cannot be realized without adequate regulatory programs at the state and federal levels.

To strengthen the effort, a strong, centralized national program (such as the one at FEMA, geared toward assisting the states through leadership, public awareness, and technical assistance) is imperative. It is, therefore, increasingly essential, as we will surely continue to face natural disasters and as our infrastructure ages, to place a high priority on mitigating risk associated with all types of disasters, whether natural or manmade.

Full funding of the National Dam Safety Program would continue to provide the needed tools to assist state dam safety programs, to increase the knowledge base and technical understanding through research and to strengthen the partnership between the federal, state and private sectors.

In closing, ASDSO strongly urges this Subcommittee to recognize the benefits of this modest investment in public safety by providing the authorized level of \$5.9 million in fiscal year 2000 to FEMA.

Thank you to this Subcommittee for its support in years past for the National Dam Safety Program at FEMA. ASDSO looks forward to working with the Subcommittee and its staff on this important public safety issue.

1998 STATE DAM INVENTORY DATA

[Inventory sizes vary from state-to-state because of number of dams, but also because state laws vary on which dams are included under their jurisdiction]

State	Total national inventory ¹	Total state regulated ²	State high-hazard ³	State reg. unsafe ⁴	Government ownership ⁵
Alabama	1,570	1,704	184	150	25
Alaska	99	87	18	55
Arizona	315	214	73	23	173
Arkansas	927	427	98	25	363
California	523	1,238	392	536
Colorado	1,648	1,808	292	189	428
Connecticut	707	3,230	236	(6)	251
Delaware	73	98	9	(6)	75
Florida	572	(6)	(6)	(6)	15
Georgia	4,853	3,311	366	57	634

Wisconsin	1,291	1,080	192	(⁶)	618
Wyoming	1,216	1,332	64	3	221
Total	74,935	93,913	9,280	1,840	19,037

¹ Includes federal and non-federal dams over 25' in height or 50 acre-feet in volume; or anything above 6' ft in height with downstream damage potential should it fail.

² Includes all dams under state regulatory control.

³ High-Hazard by state definition derived from state inventory in column 2.

⁴ Dams with identified deficiencies by state definition (varies state to state) derived from state inventory in column 2.

⁵ Derived from national inventory in column 1.

⁶ Not Reporting. Some states do not keep data on "high-hazard" and/or "unsafe" categories.

PREPARED STATEMENT OF THE AMERICAN PUBLIC WORKS ASSOCIATION

My name is Robert H. Miller, and I am Director of Public Works for the Village of Schaumburg, Illinois. I submit this statement regarding fiscal year 2000 appropriations for the U.S. Environmental Protection Agency and the Federal Emergency Management Agency as President of the American Public Works Association.

The American Public Works Association (APWA) represents 1,700 public agencies and 25,000 professionals nationwide charged with the planning and daily management of local public services and the construction, operation and maintenance of the public infrastructure. APWA members are responsible for providing a safe drinking water supply, collecting and treating sewage and implementing federally mandated urban stormwater management programs, and for the proper and safe collection and disposal of municipal solid waste. Public works agencies also manage the nation's flood control infrastructure and play an important role in communities' work to mitigate for and recover from disaster.

In determining fiscal year 2000 appropriations for VA, HUD and Independent Agencies, APWA urges the Congress to:

1. *Restore funding to the water and wastewater state revolving loan funds.*—Appropriate a combined minimum of \$2 billion to the U.S. EPA for the clean water and drinking water state revolving loan funds (SRFs). The SRFs help capitalize local investment in drinking water and wastewater infrastructure. Retain caps on state administration expenses drawn from the SRF so that the maximum possible funds reach local governments to support actual water quality programs.

2. *Retain funding for brownfields assessment, cleanup and redevelopment.*—Appropriate the approximately \$92 million proposed for U.S. EPA's budget and the additional funds for brownfields programs requested for the U.S. Department of Housing

and Urban Development. Brownfields grants to local governments are playing an important role in encouraging the efficient cleanup of low-level hazardous waste sites and spurring economic development in the nation's cities.

3. *Provide funding for the FEMA flood mapping program, Project Impact, and domestic anti-terrorism programs.*—APWA also supports creation of the National Flood Mitigation Fund, so long as other activities currently eligible for flood loss reduction project grants are not sacrificed.

WATER & WASTEWATER INFRASTRUCTURE

The great majority of costs associated with providing drinking water and wastewater services are borne by local governments. However, by providing access to interest-free and low interest loans, federal funding for the drinking water and clean water SRFs plays a vital role in helping local governments to build and maintain water and wastewater infrastructure. Continued water quality improvement can only be assured with the continued support of the federal government.

The public overwhelmingly supports federal investment in water quality infrastructure. A January 1999 poll conducted by the The Luntz Research Companies on behalf of the Rebuild America Coalition found that three-quarters of Americans are willing to pay an additional one percent in taxes to guarantee a safe and efficient sewage and water treatment system. Meanwhile, in a 1998 survey, 40 percent of APWA members identified the top challenge facing public works as the funding and financing issues associated with maintaining infrastructure. With this backdrop, the U.S. EPA proposed a combined \$500 million cut in funding for the drinking water and clean water SRFs in 2000. Thus, local governments are under increasing pressure to expand water quality programs, largely due to federal regulations, with shrinking federal dollars available to support those programs.

The Cost of Clean, a study released in March 1999 by the Association of Metropolitan Sewerage Agencies and Water Environment Federation puts the price tag at \$330 billion for wastewater infrastructure needs over the next 20 years. Even EPA, in its most recent Clean Water Needs Survey, identified a wastewater funding gap of \$139.5 billion. These needs are driven by increasing federal regulation under the Clean Water Act aimed at controlling pollution from urban runoff, combined sewer overflows and sanitary sewer overflows, and from the capital improvement needs of an aging American infrastructure. Later this year, EPA is expected to finalize new regulations to require the nation's small municipalities to implement stormwater quality programs. Thus, the need continues to grow, and APWA urges the Congress to fully fund the clean water SRF to help meet those needs.

As the Safe Drinking Water Act Amendments of 1996 are implemented, drinking water agencies must make capital improvements to meet new, stricter federal standards. Changes to the surface water treatment rules and new regulations for removing the byproducts of conventional treatment will require major infrastructure investments by water suppliers. To comply with forthcoming new limits for arsenic, for example, the American Water Works Association projects a cost of as much as \$1 billion nationwide. Water agencies also are making new and increased investments toward protect drinking water at its source under the sourcewater protection program. The drinking water SRF, authorized by the 1996 amendments at \$1 billion per year, is an indispensable tool to help local governments achieve new standards.

APWA supports full funding of the drinking water and clean water SRFs, with a minimum combined appropriation of \$2 billion for 2000.

BROWNFIELDS PROGRAMS

Federal funding for the assessment, cleanup and redevelopment of low-level hazardous waste sites known as "brownfields" is playing a key role in spurring economic development in many of the nation's large and small cities. The brownfields program provides an efficient alternative to clean up and encourage investment in disturbed sites, instead of pushing new development into undeveloped green space.

APWA supports continued funding for the federal brownfields program, administered by the U.S. EPA and the Department of Housing and Urban Development.

DISASTER MITIGATION & RELIEF

Given our responsibilities as the keepers of America's infrastructure, public works agencies play a broad and critical role in supporting the functions of emergency management, including delivering sand bags for flood fighting, repairing roads and bridges in the aftermath of an earthquake, and cutting-off and restoring utilities in the wake of a terrorist incident. On many occasions, public works departments have been applicants for disaster relief, and we are grateful for FEMA's presence and as-

sistance. For all these reasons, APWA has given keen attention to the proposed fiscal year 2000 budget for the Federal Emergency Management Agency (FEMA).

In particular, APWA supports FEMA's efforts to improve the integrity of flood insurance rate maps. Because of their function, many public works facilities, particularly water and sewage treatment plants, are located in special flood hazard areas. To minimize the flood hazard risk, it is imperative that public works agencies have accurate flood maps to guide the planning, construction, rehabilitation, and retrofitting of public works facilities. While APWA supports efforts to increase funding for the map modernization program, the association harbors doubts regarding the viability of the proposed mortgage fee. APWA would welcome the opportunity to partner in FEMA's modernization efforts and work to identify other funding sources.

In its proposed budget, FEMA has identified the mitigation of repetitive flood loss properties as a high priority. APWA recognizes how costly repetitive loss properties are to the National Flood Insurance Program—to American tax payers—but is concerned that the creation of the National Flood Mitigation Fund would divert or eliminate Flood Mitigation Assistance funds currently available for other flood loss reduction projects, such as enlarging culverts and creating small retention basins. These types of projects can be very effective in reducing flood losses and protecting insurable property and are worthy of funding, as well. APWA would support the creation of the National Flood Mitigation Fund so long as other activities currently eligible for project grants are not sacrificed.

The rising costs of disasters underscore the need for a pre-disaster mitigation program—resources jurisdictions can use to redress natural hazards outside of a presidential disaster declaration. APWA supports the initiative behind Project Impact and hopes that FEMA will move toward defined program eligibility criteria and performance measurements. APWA is concerned that without these metrics, support and funding for a pre-disaster program will diminish. APWA, along with other FEMA stakeholders, would gladly assist in this effort.

On the subject of domestic terrorism, APWA will work to expand the definition of "first responders," currently defined as police, fire, and rescue personnel. The role of public works departments in preparing for and responding to incidents of domestic terrorism continues to be overlooked. Currently, there are no resources or programs to train public works personnel in crisis and consequence management, or how to self protect. Following the Oklahoma City bombing, it was public works officials that suspended utilities in the affected areas, preventing additional damages and devastation. Public works officials also ensured the delivery of community services—water, electricity, refuse collection, traffic control—to areas not directly impacted by the bomb.

APWA would like to work with FEMA to infuse public works into domestic preparedness activities, supplementing the role of first responders. APWA supports FEMA's efforts to secure an additional \$13.2 million in funding for anti-terrorism planning, training, and exercise activities with the hope that these funds will be coordinated with resources already available through the Department of Justice. APWA also hopes that the role of public works agencies in domestic terrorism will be recognized and that necessary training will be forthcoming.

Thank you for your attention and consideration. APWA would be pleased work with you to provide additional information upon request.

PREPARED STATEMENT OF THE NATIONAL FLOOD DETERMINATION ASSOCIATION

Mr. Chairman, Senator Mikulski and Members of the Subcommittee: The National Flood Determination Association strongly supports the Federal Emergency Management Agency's plan to fully modernize its mapping program. The NFDA is a professional association of leading companies, both large and small, which make determinations on whether or not a property is in a special flood hazard area. Our clients are primarily lenders and also insurance agents or companies. The NFDA members play an important role in furthering the program compliance and flood-plain management objectives of the National Flood Insurance Program. The Association represents the flood determination industry on FEMA's Technical Mapping Advisory Council.

Accurate flood zone determinations depend on accurate and up-to-date maps. The maps were required for implementation of the National Flood Insurance Program, enacted in 1968, but since that time, their uses have expanded while the maps have grown older and technology has advanced. Some 100,000 map panels have been produced by FEMA, but 33 percent of them are more than 15 years old and another 30 percent are between 10 and 15 years old. Development and changed land use patterns significantly alter flood risk over a period of 10 to 15 years. Some areas

are mapped with more accuracy and detail than others, often depending on the quality and age of the base map upon which other information is superimposed. Often those maps reflected old engineering analyses or approximate methods that do not provide sufficient data. Also, some flood prone communities have never had a map study done.

The problem with access to good quality, up-dated flood maps was recognized by the Congress in the Flood Insurance Reform Act of 1994, which required a Five Year Map Update Needs Assessment. The Federal Emergency Management Agency has found that the results of that process make the importance of regular updating very clear because flood hazard conditions are dynamic. NFDA members and FEMA are very much aware of calls from frustrated lenders, property owners, insurance agents, developers and community officials for maps that can be used to interpret the effects of growth, construction and prior flooding events.

The Flood Insurance Reform Act of 1994 also included measures designed to improve program compliance. New tools such as the ability of lenders to force-place flood insurance on a property have resulted in much greater program participation, but have also led to more awareness of map inaccuracies and age. The 1994 law requires FEMA to respond promptly to appeals of map determinations. Appeals and requests for Letters of Map Amendment (LOMA) or Letters of Map Revision (LOMR) have grown from about 4,000 annually to about 12,000 annually. The process of changing and reissuing the paper maps is cumbersome and time consuming. LOMAs and LOMRs respond to a particular property inquiry and do not immediately result in a changed flood map, despite issuance of a number of LOMAs in a community, for example, the map in current use would still have to be used for new flood zone determinations, but may not reflect these changes. In many cases, this is due to lack of funds.

Digital technology now makes it possible to keep maps in a form that can be readily updated as new information becomes available. Use of modern technology is essential to facilitate effective functioning of the NFIP and to promote wise community planning and good development decisions. Yet, digitizing alone is not sufficient since the base maps themselves must be of a higher quality.

FEMA's Mitigation Directorate has developed a well conceived plan to update and modernize flood maps over a seven year period. The plan is costly, as investment in efficiency and longer term objectives often is. FEMA's benefit-cost analysis for the modernization plan is 2 to 1. At the present time, all of the costs of FEMA's mapping are borne by flood insurance policy holders. Some 40 percent of overall mapping activities funds are now spent to respond to map appeals, brought on largely because of map inaccuracies. There are many users of FEMA's flood maps, ranging from lenders to engineers, surveyors and community officials and emergency response professionals. It seems inappropriate for flood insurance policy holders to absorb the cost when so many others benefit.

NFDA fully supports FEMA's timely effort to begin the major task of improving and modernizing flood maps for the nation. It is critical that funds be provided for this task which is already overdue. Improved maps will save the federal government in disaster relief monies and in the cost of unnecessary LOMAs and LOMRs. Less directly, it will save money in promoting better community and development decisions.

This is a wise investment. While other funding proposals are being examined and, later, in addition to funds which may eventually become available by some other means, the appropriation of funds for map modernization is appropriate. This is an urgent need. NFDA strongly urges the Committee to appropriate funds to make sure that flood map modernization can get underway promptly.

PREPARED STATEMENT OF THE ASSOCIATION OF STATE FLOODPLAIN MANAGERS, INC.

Mr. Chairman and Members of the Subcommittee: The Association of State Floodplain Managers, Inc. is pleased to have the opportunity to share with you our thoughts relating to three initiatives in the fiscal year 2000 budget request of the Federal Emergency Management Agency. We support the initiatives to (1) begin a major overhaul and update of the flood maps that provide the basic information for hazard reduction across the country; (2) address the problem of repetitive claims against the National Flood Insurance Program; and (3) fund the pre-disaster mitigation concept of public-private partnerships targeted to specific communities with a goal of becoming "disaster resistant".

The Association of State Floodplain Managers and its 10 Chapters represent over 3,500 state and local officials as well as other professionals who are engaged in all aspects of floodplain management and hazard mitigation. All are concerned with re-

ducing our nation's flood related losses. Our state and local officials are the federal government's partners in implementing programs and working to meet our shared objectives. Many of our members are their states' coordinators for the National Flood Insurance Program.

FLOOD MAP MODERNIZATION

FEMA's Flood Insurance Rate Maps have been developed over the life of the National Flood Insurance Program, using technologies of varying sophistication and reliability. Early maps were produced quickly, using readily available resources, when there was pressure under the emergency phase of the program to make maps available. More advanced technology has often been superimposed on differing qualities of base maps. Full engineering studies to update maps have often not been possible due to financial and time constraints.

Accuracy questions are often settled through Letters of Map Amendment (LOMA) or Letters of Map Revision (LOMR). In this process, changes are not made to the map itself, but only to the map's application to an individual property, so continued and repetitive questions of accuracy arise. Approximately 45 percent of the maps are 10 years old and about 33 percent are at least 15 years old.

Accurate and up-to-date maps are important so that banks and lenders can make good decisions about what properties do and do not require flood insurance. Good maps are also important for community planning and development decisions as well as emergency evacuation planning. Flood maps are used by for state and local floodplain management for the purpose of preventing future losses to homes and public facilities. Flood maps are widely used by engineers, developers, community planners, state and local emergency management officials federal officials. Flood maps are used by HUD, EPA, the Army Corps of Engineers and FEMA's Mitigation Directorate, its Response and Recovery Directorate as well as in the Federal Insurance Administration. The Flood Insurance Rate Maps are widely recognized as being critical to efforts to reduce loss of life and property, to reduce insurance and disasters costs and to protect and utilize the natural and beneficial functions of our nation's floodplains.

Since flood maps serve so many purposes for our society, it is appropriate for American taxpayers to support modernization and updating of FEMA's mapping capabilities. Since 1990 and passage of the Omnibus Reconciliation Act, the cost of FEMA's mapping program is funded only by flood insurance policy holders through their servicing fees. The budget request seeks \$65 million, including only \$5 million in appropriated funds to fund the beginning of a multi-year effort. The remainder of the funds would come from a mechanism that has not been authorized.

About 40 percent of the current mapping budget pays for evaluating and responding to dramatically increasing numbers of requests for LOMAs and LOMRs. This shows the need for better maps, but it also makes clear the importance of beginning map modernization now so as not to "waste" more money on the much less efficient LOMA and LOMR process. ASFPM believes that it is fitting and proper for this Committee to approve the appropriation of general funds for flood map modernization. Indeed, ASFPM would urge an annual general fund contribution commensurate with the value of the flood maps for all taxpayers.

REPETITIVE LOSS

Repetitive loss properties are those that have filed numerous flood insurance claims. This has emerged as a problem that demands attention. While most cases of repetitive loss are hardly as egregious as those featured in national news coverage this past year, the losses do represent a drain on the Flood Insurance Fund. The drain has contributed to the need for more borrowing from the federal Treasury, representing a cost to taxpayers.

The NFIP was established so that flood-prone citizens would contribute to their own recovery. It saves the federal government and the taxpayers the cost of disaster relief every time a flood strikes. It provides a means to encourage communities to plan and implement effective floodplain management strategies.

Most properties subject to repetitive loss are older structures, built before the Flood Insurance Rate Maps (FIRMs) were developed. The NFIP has shown itself over its 30 years to be an effective vehicle for addressing recovery needs of flood-prone property owners rather than repetitive payment of disaster relief from the general Treasury. Some form of federal assistance will likely always be provided after major floods, therefore, it does not seem useful to deny insurance to repetitive loss properties. ASFPM believes it is more effective to address the problem through mitigation to prevent future flooding.

FEMA has proposed to combine a new appropriation of \$12 million with the Floodplain Management Assistance program (FMA) in a focused effort to deal with the most problematic cases of repetitive loss. The NFIP, now funded entirely by premiums from policyholders, has lessened disaster relief costs to taxpayers. It is, therefore, reasonable to appropriate \$12 million in general funds to assist in managing this serious drain on the National Flood Insurance Fund.

PROJECT IMPACT

Project Impact is FEMA's disaster loss prevention initiative which fosters partnership between the federal, state and local governments as well as with the private sector, including businesses and non-profit entities. The objective is to mobilize a community's members to plan and implement their own disaster loss reduction plans, programs and projects. Success at the local level, where disasters' impact is most felt, requires full local participation. Local public and private generation and implementation of plans is an important pilot concept to support. ASFPF supports the requested \$30 million for this effort.

The Association of State Floodplain Managers would be very glad to respond to any questions from Subcommittee Members or staff. I can be reached at the South Carolina Department of Natural Resources at (803) 734-9120 and the ASFPF Executive Director, Larry Larson, can be reached in Madison, Wisconsin at (608) 274-0123.

PREPARED STATEMENT OF THE INTERNATIONAL ASSOCIATION OF EMERGENCY MANAGERS

Mr. Chairman and Members of the Subcommittee: The International Association of Emergency Managers (IAEM) would like to comment for the subcommittee's record on the proposed fiscal year 2000 budget for the Federal Emergency Management Agency (FEMA). IAEM urges Congress to fully fund the FEMA budget request for fiscal year 2000.

IAEM is a 1,700-member organization which represents the interests of emergency management professionals in local, state and federal governments, the military, private business and the non-profit sector, both in the U.S. and in other countries. Most of its members, however, serve local governments within the U.S. borders.

Comprehensive emergency management encompasses the entire public safety and service community, with a mission that includes mitigation, planning, response and recovery. On a daily basis, our members help their communities or their organizations plan for, respond to and recover from a wide variety of emergencies hurricanes, winter storms, floods, fires, droughts, earthquakes, chemical spills, transportation accidents, infrastructure breakdowns and others. Lately we've added terrorist activities, cyber-terrorism and Y2K.

For many years, there has been a recognized emergency management partnership that encompasses local, state and federal governments. Although the federal partner (FEMA) acknowledges the primary importance of that local component, budget pressures in recent years have meant a dwindling amount of federal dollars passed through to the local level, which is the first line of defense in any emergency.

FULL FUNDING

IAEM urges Congress to fully fund the FEMA budget request for fiscal year 2000. Many of the initiatives to be funded by the proposal are long overdue, including continued attention to pre-disaster mitigation and flood mitigation in particular, a start on modernization of floodplain maps, the focus on repetitive flood losses, and money for enhanced training and planning for anti-terrorism efforts at the state and local level.

CONSOLIDATED GRANTS

FEMA's budget request calls for consolidating the bulk of FEMA grant programs for state and local jurisdictions into a single, more flexible funding stream, called Emergency Management Performance Grants (EMPG). One of the grant programs to be put under this new umbrella is State & Local Assistance (SLA).

While IAEM believes the new grant mechanism may mean fewer complications and greater ability for states to target their particular needs, members have serious concerns about what the change will mean for funding at the local level—especially when coupled with the new requirement that all SLA funding be a 50-50 federal/state match. (Previously, parts of the SLA money was 100 percent federal funds.)

Aside from direct funding of local jurisdictions, there is a second concern: continuation of state-provided training, which is among the most important services that state emergency management agencies provide to local governments, and unfortunately is also the first service they cut when funding is cut.

LOCAL REQUIREMENTS

Emergency management happens at the local level. If there is no local program, an emergency situation quickly gets out of control, and there is no focal point for coordination of outside help from the state, the federal government or private relief agencies.

In the pre-Stafford Act, Civil Defense days, FEMA distributed SLA funds to states and required them to pass through two-thirds of the money to local jurisdictions. This requirement helped to ensure a floor-level local capability in many jurisdictions. Not all states strictly observed the requirement, and the federal pass-through funds in recent years typically provided only 15–30 percent of program budgets for most localities which received SLA funds. Nevertheless, it was a commitment by the federal and state governments to the local-state-federal partnership so crucial to effective emergency management.

There is no longer a pass-through requirement, and states are free to pass funds through or not. It's not hard to understand how the increasing demands on emergency management lead to a great temptation to keep more funds within state programs.

IAEM believes it is essential that FEMA develop and maintain standardized minimum program requirements relative to state administration of funds in support of local programs, should the proposed Emergency Management Performance Grants (EMPG) concept be approved. These requirements should include a formula by which local jurisdictions are assured an equitable portion of FEMA dollars.

IMPORTANCE OF TRAINING

For emergency managers at the local level, one of the greatest direct benefits derived from federal funding to states is the provision of training and exercise programs. These were among the 100 percent federally-funded SLA programs, and we fear that the move to a 50–50 match will result in degradation of these programs. We already have seen that training for local jurisdictions is one of the first items to suffer a hit when state budgets are squeezed either there is less training offered, fees are tacked on, or state employees become the major beneficiaries instead of local-level practitioners.

In the best of all worlds, IAEM would like to see the continuation of 100 percent funding for training and exercise programs that directly benefit all local jurisdictions within the state. At the least, Congress should require that FEMA's rules for its new performance grant program include requirements to maintain a certain level of training and exercising to benefit local jurisdictions.

IAEM members thank you for the opportunity to comment on the proposed FEMA budget. Our members and staff are available if you have any follow-up questions.

PREPARED STATEMENT OF FLORIDA STATE UNIVERSITY

Mr. Chairman, thank you and the Members of the Subcommittee for this opportunity to present testimony. I would like to take a moment to acquaint you with Florida State University. Located in the state capitol of Tallahassee, we have been a university since 1950; prior to that, we had a long and proud history as a seminary, a college, and a women's college. While widely known for our athletics teams, we have a rapidly emerging reputation as one of the Nation's top public universities. Having been designated as a Carnegie Research I University several years ago, Florida State University currently exceeds \$110 million per year in research expenditures. With no agricultural or medical school, few institutions can boast of that kind of success. We are strong in both the sciences and the arts. We have high quality students; we rank in the top 25 among U. S. colleges and universities in attracting National Merit Scholars. Our scientists and engineers do excellent research, and they work closely with industry to commercialize those results. Florida State ranks fourth this year among all U.S. universities in royalties collected from its patents and licenses, and first among individual public universities. In short, Florida State University is an exciting and rapidly changing institution.

Mr. Chairman, let me describe several projects that FSU is pursuing this year. The first is a joint project with the City of Tallahassee involving an economic development initiative with the arts.

Florida State University and the City of Tallahassee propose to jointly seek funding to stimulate economic development in an area of Tallahassee that is adjacent to the FSU campus. The Frenchtown community, a redevelopment priority for the city, is one of the highest priorities of the City and is the University's highest capital construction project. The vehicle for providing this boost to the economic revitalization of this area will be a performing arts center that will be housed on the edge of the FSU campus adjacent to the Frenchtown area. That area, once a thriving resource to the Tallahassee area has, in recent years, become a high crime area consisting of deteriorating buildings, empty lots and abandoned housing. Such a new facility would provide a location that would allow for over 400 performances a year with audiences drawn from the surrounding communities throughout the Panhandle region of Florida, and including portions of southern Georgia and western Alabama. Audiences for the Center's performances will be drawn to commercial establishments created as part of the Frenchtown Revitalization Project. Small shops and restaurants, immersing as part of this revitalization effort, would be the catalyst for further development and enhanced opportunities for residents.

Private funds would be available to match the federal portion several times over. We will be requesting \$3 million in fiscal year 2000 for this effort as an Economic Development Initiative grant.

Next, I would like to discuss a project involving Digital Emergency Broadcasting. Since 1995, FSU has delivered emergency information to citizens of northwest Florida as they have endured floods, hurricanes, tornadoes, and wildfires. These experiences have not only enhanced our awareness of the need to pass on accurate information to the general public but has also strengthened the ties between our stations and Florida's Department of Emergency Management and their Emergency Operations Center (EOC). Because of the success of our broadcasts, the FSU stations have recently entered into an agreement to act as the television production entity for the EOC during emergencies.

FSU and their broadcasting stations recognize a genuine need for additional emergency services and propose a partnership with the Federal Emergency Management Agency (FEMA) to explore the possibility of broadcasting emergency information to FEMA field personnel and/or to the general public during emergencies in the stations' coverage area using this new technology. We believe that there can be great advantages in the ability to broadcast the latest information available directly to PCs using DTV at times when other telecommunications infrastructure may be inoperative. With FEMA's investment into this initiative, a partnership could be formed with the FSU stations and Florida's Department of Emergency Management to better serve the citizens of the North Florida area during a disaster, which could eventually be duplicated nationwide. This is a worthwhile project will save lives in the areas where implemented.

We are requesting \$600,000 from FEMA in fiscal year 2000 for basic infrastructure costs for this initiative.

Another project, Mr. Chairman, that Florida State University is pursuing is related to the creation of a Challenger Learning Center in Tallahassee and located at the FSU-Florida A&M University College of Engineering building. That Center, which will have 34,000 square feet of exhibit space, will house a space mission simulator with a mock-up of "Mission Control" and the laboratory node of a "Space Station" as well. Between 10-15,000 middle school students will visit the Center each school year, having been drawn broadly from 66 counties in north Florida, south Georgia, and southeastern Alabama. As a member of the Florida Space Grant Consortium, Florida State University is one of the seventeen public and private members of this association. Collectively, the Consortium serves more than 230,000 university students and also is involved in substantial outreach work with K-12 students as well.

Our request, Mr. Chairman, is that you and your Subcommittee consider funding NASA's Space Grant Consortium program at a level above the level requested by NASA. This is an important national program and deserves greater funding. The Florida Space Grant Consortium will be approached to provide additional funds for the FSU-FAMU Challenger Learning Center project. It is our hope that at least \$100K could be made available to the Challenger Learning Center of any additional Florida funding that might be available. It would greatly enhance our outreach efforts throughout Florida, Georgia, and Alabama to K-12 students.

Finally, Mr. Chairman, I would like to thank this Subcommittee for its interest last year in your report and the conference report on the concerns expressed about orimulsion and its potential environmental impact. The Environmental Protection Agency (EPA) will be issuing some program guidance resulting from similar concerns about environmental impacts this and other heavy fuels might have and how those impacts might affect water quality and how could these various fuels be miti-

gated in case of a spill. We here at FSU are persuaded we have a unique approach to a examine such impacts in a total biological community approach. We are persuaded we have a unique and much more effective means of assessing impacts on the marine environment and will be discussing this further with EPA. We will keep the Subcommittee informed of our progress in this arena.

Mr. Chairman, as you can see, Florida State University has numerous projects and proposals pending before several of the agencies and departments within your jurisdiction. I would like to discuss one final activity that is preparing its renewal proposal to NSF. I call it to your attention because the decision made in the early 1990's by the NSF and its Board was an excellent one and one that has been borne out to have been highly successful. Florida State University's National High Magnetic Field Laboratory was awarded its first five-year contract in the early 1990's following a highly-publicized competition and decision by NSF and its Board. The NHMFL was renewed for another five years in 1996 and is preparing for its third proposal to NSF in the fiscal year 2000 budget year. I would only like to call your attention to this extraordinary facility which is an excellent example of partnerships between both the federal government and the State of Florida, a national laboratory, and Florida State University. It has developed state-of-the-art magnet technologies and systems in collaboration with numerous industries. It has attracted a world-class faculty to Tallahassee. It is doing research, development, and education at all levels including an extremely active K-12 outreach effort with the children of Florida and the southeastern U.S. It is a success story that your Subcommittee and the National Science Foundations should be proud to claim.

Mr. Chairman, I would like to conclude with a discussion of the overall budget of the National Science Foundation. NSF provides support for scientific and engineering research and educational activities at colleges and universities around the Nation. Their support and the quality of their programs and staff are unparalleled in the federal government. They provide approximately \$30million per year to Florida State University so selfishly they are incredibly important to this university. I am asking that your Subcommittee look at the NSF request as the base and make every effort to secure additional funds that you could invest in the NSF and its programs. There can be no better return on investment than in research and development.

Related to NSF is a concern that is becoming broadly shared by the research community. That concern relates to the disproportionate share of federal R&D being appropriated to the biomedical sciences and substantially lesser amounts for other R&D activities that truly provide the foundation for new knowledge and breakthroughs in all sciences, including the medical sciences. While many of our scientists are less articulate in making the case for basic scientific research support like that provided by NSF, it clearly is incredibly important for our Nation's future.

I hope that your Subcommittee, as it makes its very difficult decisions regarding priorities for spending those resources allocated to your Subcommittee, please consider this issue of balancing federal R&D. This might require coordination among several of the key Appropriations subcommittees to ensure that investments which can benefit several scientific areas be considered appropriately. For instance, there are recent funding precedents that have seen NIH supporting the upgrades of synchrotrons which have been the responsibility of the Department of Energy. The OSTP Director, in a January 1999 report on this subject, indicated that this type of multipurpose funding by NIH of broader scientific instruments and facilities should be considered. Nuclear Magnetic Resonance (NMR) was one area noted as a possible candidate for such NIH funding because such funding by NIH would benefit broader scientific areas like biology, materials sciences, and others. I would request that your Subcommittee consider working with other key Appropriators to determine if utilization of certain NIH funds might be designated for instrumentation that has multidisciplinary benefit. While NSF clearly has successful programs to manage such large instrumentation projects, the NIH does not. Yet NIH has consistently garnered funding increases that the NSF has never seen previously. Seeking creative ways to redress the balance among scientific fields might assist in "rebalancing" federal funding among agencies and functions.

Mr. Chairman, I have described just a few of the exciting activities going on at Florida State University that will make important contributions to solving some key problems and concerns our Nation faces today. Your support would be appreciated, and, again, thank you for an opportunity to present these views for your consideration.

PREPARED STATEMENT OF THE NATIONAL EMERGENCY MANAGEMENT ASSOCIATION

Please accept these comments from the National Emergency Management Association (NEMA) regarding the Federal Emergency Management Agency Year 2000 budget request. NEMA represents the emergency management directors in the 50 states and territories responsible to their governors for emergency preparedness, mitigation, response and recovery activities. The FEMA budget provides critical dollars to support state and local emergency management programs. NEMA urges your strong support of the budget as presented with consideration for additional dollars above the request in the State and Local Assistance program.

The FEMA Year 2000 budget request reflects the incredible growth of all-hazards emergency management activities in recent years—from domestic terrorism preparedness to Y2K to international disaster relief and now planning for school safety. Emergency management programs at all levels of government face difficult challenges today including the expectation to do more with less, increased competition for resources, increased frequency and destructiveness of disasters and increased public expectations for services. In addition, there is an expectation by Congress to reduce disaster costs.

NEMA is proud to inform you that states are rising to meet these challenges. They are committing greater resources than ever before to emergency management. According to a recent survey by NEMA, states spent \$2.77 billion on emergency preparedness, mitigation, response and recovery in fiscal 1997, which is nearly double the amount spent only five years ago. And while emergency management once focused on responding to and recovering from disasters, states are now clearly focusing their efforts and resources on mitigation or prevention efforts to reduce the costs of future disasters. The NEMA survey revealed that states spent \$1.24 billion on mitigation activities in fiscal 1997 which is 45 percent of spending on all four phases of emergency management. This is an 80 percent increase over the previous year.

The budget request includes a new Emergency Management Performance Grant (EMPG) that will consolidate separate funding streams and replace the current Performance Partnership Agreement. NEMA understands the benefits of the consolidated grant will include flexibility for the states to meet emergency management priorities, and more efficiently use state staff and financial resources. The increased flexibility promised by FEMA will help to enhance the professionalism of state and local emergency management programs and build a decentralized capability for preparedness and response. NEMA has been working in cooperation with FEMA to develop program goals and objectives. We are excited about the opportunities the consolidated grant provides for states.

The proposed Emergency Management Preparedness Grant includes a request of \$141 million for grants to states with an increase of approximately \$4 million for State and Local Assistance funding. The SLA funds are pass through grants to state and local governments and provide the very foundation upon which basic emergency management capabilities are built. The \$4 million increase in SLA funds over the previous year is sorely needed. In fact, a significantly larger increase in SLA funding is needed to bring the program up to the intended 50/50 match between the federal government and states. States reported that shortfalls in SLA grants totaled more than \$152 million in fiscal 1997. This is \$27 million more than fiscal 1996 and \$68 million more than fiscal 1992. As you can see, funding has not kept pace with increased emergency management responsibilities and public expectations for a world class emergency management system. In addition, the cost share for the SLA program will shift to 50/50 in the Year 2000. This has had a negative impact on budgets and staffing levels in several states with limited financial capacity. Other states have been able to secure the necessary matching fund requirements. Regardless of their states' current financial capacity, all state of financial share the common concern that the future of basic emergency management programs and capabilities will be in jeopardy if we continue to shift costs to state and local governments and piecemeal funding for emergency management through special programs that may or may not be national priorities in future. With this in mind, we urge you to seriously consider providing additional SLA funds over and above the FEMA request.

Other FEMA budget initiatives supported by NEMA include the request for \$30 million for pre-disaster mitigation. This is truly the only way we can reduce disaster costs. As I mentioned earlier, states have followed FEMA's lead and focused their efforts on prevention. Ninety percent of spending for emergency management in fiscal 1997 occurred before disasters could strike. NEMA is working in partnership with FEMA to collect mitigation success stories and to document the cost-effectiveness of such activities as property buyout and relocation projects. FEMA's request for an additional \$12 million to focus on removing repetitive loss structures from

floodplains is very important and will prove to be a wise use of federal and state dollars.

A critical initiative that has been significantly under-funded within FEMA is the domestic preparedness program. FEMA has a critical role to play as the lead federal agency for consequence management, but hasn't received the funds to appropriately support that lead role. In turn, states have received little funding to adequately plan, train and exercise for potential terrorist incidents. NEMA fully supports FEMA's request for additional anti-terrorism funds \$8 million of which is targeted to go to states for planning and exercises. This is critical if states are to develop comprehensive state terrorism strategies that build upon the existing capabilities of local, state and federal government already in place as part of the nation's all hazards emergency management system. It is important to note however, that special program funds such as these cannot be used to support day-to-day emergency management functions and should not be viewed as a source of funding to replace critical State and Local Assistance dollars. Having said that, the nation's domestic preparedness program is of great importance to NEMA and there are many coordination issues that must be addressed if we are to be successful in this endeavor.

In closing, NEMA would like to express its continued support and appreciation for FEMA Director James Lee Witt. He remains a good friend to state and local government, but more importantly a strong advocate for all our citizens when they become victims of disasters.

Please feel free to call on NEMA at any time as a resource on emergency management issues. Thank you for your strong interest and work in the emergency management arena.

PREPARED STATEMENT OF THE ASSOCIATION OF STATE FLOODPLAIN MANAGERS, INC.

Mr. Chairman and Members of the Subcommittee, The Association of State Floodplain Managers, Inc. is pleased to have the opportunity to share with you our thoughts relating to three new initiatives in the fiscal year 2000 budget request of the Federal Emergency Management Agency. We support the new proposed initiatives to (1) address the problem of repetitive losses in the National Flood Insurance Program; (2) begin a major overhaul and updating of the flood maps produced and used by FEMA; and (3) fund the concept of public-private partnerships targeted to specific communities with a goal of becoming "disaster resistant". The Association of State Floodplain Managers and its Chapters represent over 3,500 state and local officials as well as other professionals who are engaged in all aspects of floodplain management and hazard mitigation. All are concerned with working to reduce our nation's flood related losses. Our state and local officials are the federal government's partners in implementing programs and working to achieve effectiveness in meeting our shared objectives. Many of our members are their states' coordinators for the National Flood Insurance Program.

REPETITIVE LOSS

Repetitive loss, the filing of numerous flood insurance claims on the same property, has emerged as a problem in the functioning of the NFIP that demands attention. While most cases of repetitive loss are hardly as egregious as those featured in national news coverage this past year, the losses do represent a drain on the Flood Insurance Fund. Such a drain on the Fund can result in the need for more borrowing from the federal Treasury, representing a cost to taxpayers. The NFIP was established to help citizens with the cost flooding in a manner in which those at risk paid into their assistance, to save the federal government and its taxpayers the cost of disaster relief every time a flood struck and to provide a means of encouraging communities to plan and implement effective floodplain management strategies. Often, properties subject to repetitive loss are older structures, in place before the Flood Insurance Rate Maps (FIRMs) were developed. The program considers pre-FIRM properties to be those built before 1974. Since the NFIP has shown itself over its 30 years to be a useful vehicle for addressing recovery needs of flood-prone properties rather than repetitive disaster relief payments from the general Treasury. Since it is unlikely that some form of federal assistance would not be provided in the face of a natural disaster, it does not seem useful to deny insurance to repeat claims, but perhaps to address the problem through increased premiums or through steps to prevent future flooding. Unfortunately, many policyholders do not have sufficient savings or income to take often expensive steps to mitigate future flooding. FEMA has proposed to combine an appropriation of \$12 million with its funds for the Floodplain Management Assistance program (FMA) in a new effort to assist the most problematic cases of repetitive loss through elevation,

floodproofing or buyout of the property. Since the NFIP, funded largely by premiums from policyholders, has lessened disaster relief costs to taxpayers, it seems very appropriate to appropriate \$12 million in general funds to assist in removing the most serious drains from the National Flood Insurance Fund.

FLOOD MAP MODERNIZATION

FEMA's Flood Insurance Rate Maps have been developed over the life of the National Flood Insurance Program, using technologies of varying sophistication and reliability. Early maps were produced quickly, using readily available resources, when there was pressure under the emergency phase of the program to make maps available. Later, more advanced technology has often been superimposed on differing qualities of base maps. Full map studies to update maps have often not been possible due to financial and time constraints, so accuracy questions have often been settled through Letters of Map Amendment (LOMA) or Letters of Map Revision (LOMR). In this process, changes are not made to the map itself, so continued and virtually repetitive questions of accuracy arise. Approximately 45 percent of the maps are 10 years old and about 70 percent are at least 5 years old. Accurate and up-to-date maps are important to making proper decisions about what properties do and do not require flood insurance, but they are also important to community planning decisions. Flood maps are used by our members in floodplain management for the purpose of preventing future losses to homes and public facilities. Flood maps are tools widely used by engineers, developers, local community planners, state and local emergency management officials and federal officials, both in FEMA's Mitigation Directorate and its Response and Recovery Directorate as well as in the Federal Insurance Administration. The Flood Insurance Rate Maps (FIRMs) are widely recognized as being critical to efforts to reduce loss of life and property, to reduce insurance and disasters costs and to assist in utilizing the natural and beneficial functions of our nation's floodplains. Since flood maps perform so many functions for our society, it seems entirely appropriate for American taxpayers to support modernization and updating of FEMA's mapping capabilities. At present, the cost of FEMA's mapping program is funded only by flood insurance policy holders through their premiums and servicing fees. The budget request seeks \$65 million, including only \$5 million in appropriated funds to fund the beginning of a multi-year effort. The remainder of the funds would come from a mechanism that has not been authorized. Apparently about 40 percent of the current mapping budget pays for evaluating and responding to dramatically increasing numbers of requests for LOMAs and LOMRs. This shows the need for better maps, but it also makes clear the importance of beginning map modernization now so as not to "waste" more money on having to issue more LOMAs and LOMRs. It is the view of ASFPM that it is fitting and proper to contribute general funds to flood map modernization.

PROJECT IMPACT

Project Impact is an important disaster loss prevention initiative which fosters partnership between the federal, state and local governments as well as with the private sector, including businesses and non-profit entities. The objective is to mobilize a community's members to plan and assist in funding their own disaster loss reduction plans, programs and projects. Success at the local level, where disasters' impact is most felt, requires full local participation. Local public and private generation and implementation of plans is an important pilot concept to support. We hope that the requested funding for this effort can be provided. It is my hope that these comments on aspects of FEMA's fiscal year 2000 budget request will be helpful to the Subcommittee. The Association of State Floodplain Managers would be very glad to respond to any questions from Subcommittee Members or staff. I can be reached at the South Carolina Department of Natural Resources at (803) 734-9120 and the ASFPM Executive Director, Larry Larson, can be reached in Madison, Wisconsin at (608) 274-0123.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

PREPARED STATEMENT OF THE STATE COOPERATIVE EXTENSION SERVICES AND STATE AGRICULTURAL EXPERIMENT STATIONS

Mr. Chairman, members of the subcommittee: As the respective Chairs of the Extension Committee on Organization and Policy (ECOP) and the Experiment Station Committee on Organization and Policy (ESCOP) of the National Association of State Universities and Land Grant Colleges (NASULGC), we appreciate the opportunity

to discuss the importance of inter-agency partnership in education and research in space and agricultural programs.

As components of NASULGC, a non-profit organization, ECOP and ESCOP represent a national network of Land Grant University-based State Cooperative Extension Services (CES) and State Agricultural Experiment Stations (SAES). The Land Grant University system (LGU) and the USDA-Cooperative State Research, Education, and Extension Service (CSREES) have had a thriving partnership of many years, providing the technology which has made American agriculture the most productive and efficient in the world. Our organization is committed to advancing scientifically-based decision making at the local level by capitalizing on the LGU comparative assets in extension, education, and research. Furthermore, our Land Grant University institutions have a critical mass of educational and scientific infrastructure and facilities.

We believe technology transfer models are crucial to the ultimate success of any proposed joint venture. Joint venture partners must be able to integrate their intellectual assets and science infrastructures efficiently, and then move-out the products of the joint effort quickly into practical applications to be used in the real world.

As a key anchor in the real world of agriculture, the State Cooperative Extension Services would be the cornerstone of our proposed space-based technology and education delivery model to the ultimate end user—the American Farmer.

The Land Grant University system can contribute significantly to such a model with NASA as the partner. The Land Grant system has a knowledge base about the way agriculture is practiced and can readily find opportunities within agriculture for fruitful space research partnerships. We believe Agriculture can be made a solution to many of the problems the nation faces.

CES and SAES's major focus in the space and related food and fiber production and natural resource management areas include: NASA Remote Sensing Applications Research in Agriculture, Forestry and Range Resource Management and Precision Agriculture; Risk and damage assessment caused by a variety of physical, biological, chemical and anthropogenic stresses; Vegetation Mapping, Inventory, Characterization and Monitoring; Earth science applications and technologies; The National Agricultural Weather Information System, and Environmental education and outreach.

In not recreating the wheel, the Land Grant University system aims at partnering with NASA, and where helpful by also including the supplemental contributions of agencies such as NOAA and NSF, to collaborate on numerous space and food and fiber production and natural resource management initiatives. Many agencies share similar public education priorities and research goals that can be utilized to develop partnerships and collaboration. Many initiatives and goals are targeted to specific agendas, however a more thorough inventory of extension, education and research priorities can be assessed through collaborative discussions and pooling of resources.

Through a variety of means, a partnership between NASA and the Land Grant University system as well as NOAA and NSF and other agencies would increase: The rate of technology transfer and development between the partners; the amount of LGU participation in agency peer review processes; the quantity/quality of proposals submitted by the LGUs for government funded competitive grants in related space/agricultural areas; the exchange of scientists between LGU institutions and the government for collaborative projects.

For example, the USDA (through the Land Grant System) and NASA have already jointly developed the Space Grant Geospatial Extension Specialist Program. The National Space Grant College and Fellowship Program—in short: the Space Grant Program—has begun an effort to bring the benefits of NASA's Earth Science Enterprise and of Remote Sensing to the American public in partnership with the Land Grant Cooperative Extension System.

The Space Grant Program, modeled after Land Grant and Sea Grant university programs, is administered by NASA and consists of a nationwide network of universities, aerospace and related industries, state and local government organizations and other institutions dedicated to education, research and public service, including outreach, in aerospace science and technology. There are 52 Space Grant Consortia in each of the 50 states, the District of Columbia, and Puerto Rico, with over 700 affiliates. A large part of the more than \$19M allocated yearly to Space Grant go to scholarships and fellowships for university students and are matched with university and other funds. A smaller percent of Space Grant funding is used to build new research infrastructure. The partnership with Extension is a more recent effort and is presently in a pilot phase.

Space Grant Consortia are led in each state by exceptionally dedicated administrators who strive to better help educate our youth in science and technology, to

bring the benefits of Aerospace Science and Technology to the public, to build local programs benefiting their states, who utilize NASA seed funding to leverage opportunities, create partnerships between universities, industries, state agencies, non-profit organizations, local government and schools, and build high technology research infrastructure at colleges and universities. They are a bridge between the public and youth on one side and NASA and aerospace industry on the other side.

Four years ago Space Grant began exploring the possibility of partnering with the Cooperative Extension System to bring the benefits of NASA space products one step closer to the taxpaying public. The obvious NASA Enterprise chosen to work with is the Earth Science Enterprise (formerly Mission to Planet Earth). In the process it became clear that many applications of Earth imagery from space would result from commercial remote sensing. For example, a marriage of sorts could be envisioned between data and information technology on one hand and user communities on the other hand. The Space Grant Extension Specialist will have expertise in remote sensing and associated technologies, strong ties to the NASA Earth Science Enterprise and be part of the Cooperative Extension System.

The Specialist will act as a two-way conduit for information between NASA and user communities. He or she will: (1) Assess state needs for remote sensing research, value-added products, training, information and technology; (2) Initiate pilot research projects for remote sensing applications and extend their results to the users communities in the state through the network of county agents; (3) Involve commercial remote sensing data providers and value-added companies in his/her activities; (4) Facilitate the development of training curricula for professionals, Agents and other extension specialists; and (5) Support the education, research and outreach efforts of the State Space Grant Consortium in Earth Science and Remote Sensing.

Three Land-Grant universities, Utah State University, the University of Arizona, and Mississippi State University will serve as pilot programs to test and further develop the concept this year. It is expected that future NASA funding will allow additional Space Grant State Consortia to become involved in the project. Linking Space Grant and Extension networks is a very worthwhile and promising endeavor which may provide NASA an effective-vehicle for technology and information transfer to the user communities.

The Land Grant University system would like to see the formation of a partnership between these agencies for an expanded effort. It is efforts like these that make for meaningful partnerships. Such a partnership should be formed and accelerated, given the U.S. and world population growth, and its future need for food both in quality and sustainability as well as the nation's need to maximize new space-based technologies to maintain our global competitiveness in food and fiber production and natural resource management on public lands.

It is just these kinds of partnerships with the Land Grant Universities that can be developed which utilize the expertise that has been established over many years of striving to achieve rather different goals, i.e., increased productivity, and can now be focused on different but related problems.

Over the many scores of years they have been operating, the Land Grants also have developed a system of technology transfer that is the envy of the world. It is this kind of expertise which may be used to disseminate the progress made through extension and research and is not necessarily limited to farmers but can be used to educate the general public.

Thus the partnership approach maximizes the effective use of established skills to solve new sets of problems and in the overall scheme can be expected to solve them more efficiently and with less cost toward factors in an era of constrained resources.

The Land Grant infrastructure is a proven delivery system.

NASA and other agencies have existing and new initiatives to address many of the nation's agricultural and environmental problems. The Land Grant University system continues to build its relationships with various agencies in support of the nation's agricultural and natural resource system. It plans to encourage interagency communication and to broaden LGUs federal participation in USDA. A well-planned initiative could unify representatives from the State Cooperative Extension and Services the State Agricultural Experimentation Stations, Natural Resource Conservation Service (NRCS), the Forest Service, and the Agricultural Research Service and extend this unified expertise to NASA. This goal is aimed at enhancing the collaboration that is occurring at the local level between LGUs and USDA and other agencies. CES and SAES have identified existing resources in agencies for various programs which are targeted at addressing the scientific educational and research infrastructure between agriculture and NASA.

Endorsed programs areas	Department/agency
Precision Agriculture and Forestry	NASA/OES
Remote Sensing Applications	USDA/NASA
Geospatial Extension	DOE/NASA
Earth Science Enterprise	NASA/USDA
Risk and Damage Assessment	NASA
Global Climate	NASA/NOAA
Socio-economic Dimensions	NASA/NOAA

The Land Grant University system offers a full portfolio in its extension, education, and research program. The LGUs offer the technical innovation and new management ideas to implement a national agricultural/space research and development program. Our scientists provide public understanding through our extended outreach and education programs and provide for rapid advances in information technologies through our research portfolio. Additionally the LGUs can serve as a valuable resource when developing standards and perhaps most critically by providing technology transfer to farmers and communities in every county in America and the U.S. territories.

In the area of small farms, extensive research expertise already exists among the Land Grant system's 1890s (traditionally African-American) colleges about how agriculture is practiced on small scale farms. Jointly developed NASA and Land Grant technology could focus on the problems of small farmers and could reverse hopefully recent trends enhancing their competitiveness. Tuskegee University has already made significant contributions toward NASA-driven technologies in the area of precision agriculture. The 1890s as well as many other Land Grant Universities could help advance the development of these important space-based agriculture technologies.

CES and SAES would be pleased to provide an expanded "on-the-ground" and "in-the-field" role for the LGU System on energy and environmental issues and research. Through the excellent electronic communications network of the LGU System, government agency-partners can reach the appropriate administrators, scientists, academic program personnel, and extension representatives almost immediately as the situation demands. We hope we have highlighted the science benefits and value of partnerships between the Land Grant system and NASA and other agencies to solve some of the nation's pressing agricultural problems. We stand ready to help.

PREPARED STATEMENT OF THE UNITED SPACE ALLIANCE

Mr. Chairman, thank you for giving me the opportunity to submit testimony for the record before your Subcommittee.

I am Russ Turner, the President and Chief Executive Officer of the United Space Alliance (USA). USA is responsible for the day-to-day management of NASA's shuttle fleet under a single prime contract awarded by NASA in 1996. The company employs 9,000 people, mostly in Texas and Florida and had 1998 revenues of \$1.4 billion. USA's primary mission is safe operation of the Shuttle; additional duties under our contract are: Mission design and planning; flight operations; payload integration; logistics; astronaut and flight controller training; vehicle processing, launch and recovery; and software development and integration.

Mr. Chairman, we at USA are proud to operate this vital and unique national resource. The Space Shuttle is a critical part of the Nation's space infrastructure and will continue to fly for at least 10 more years. To insure safe and efficient operation of the Nation's Space Shuttle fleet, NASA and its industry team have embarked on an upgrades road map for the Shuttles.

The International Space Station (ISS) is critically dependent on the Space Shuttle from assembly through the end of the program, and today, only the Shuttle can meet NASA's human space flight needs beyond ISS. The Shuttle fleet has more than 75 percent of its design life remaining so upgrades will maximize the return on our nation's investment. Upgrades that combine both the latest technology and the most dependable and proven technology benefit the entire program.

Our central issue to bring to the Subcommittee's attention is this: the Space Shuttle Upgrades program is underfunded, and it is imperative that NASA continue upgrading the only reusable launch system in the world to insure that maintainability and obsolescence issues do not jeopardize the Nation's Human Space Flight Program.

To improve Shuttle safety and productivity, investments need to be made in technologies beyond those in NASA's fiscal year 2000 budget request. We are asking your Subcommittee to add \$25 million above the budget request to support the purchase of long-lead items for Phase 3 upgrades which will further improve Shuttle safety and reliability while reducing cost. In addition to those upgrades included in the NASA budget request, others have been identified, as follows:

- Electric Auxiliary Power Units (APUs)* will make significant improvement in safety as well as, improve the performance and reliability of the Space Shuttle's hydraulic systems.
- SSME Advanced Health Management System (AHMS)* will help flight safety and ground maintenance checkout of the Space Shuttle Main Engines (SSMEs) through advanced monitoring and detection systems.
- Main Propulsion System (MPS) Electromechanical Actuators* will provide safer and more efficient operation and monitoring of propellant valves.
- Proton Exchange Membrane (PEM) Fuel Cells* will reduce operating costs while also increasing electrical power for Orbiter systems and payloads.

No other launch vehicle in the world, either in use or in development today, possesses the capability or versatility of the Space Shuttle. Additionally, the Shuttle program is better than ever with improved safety and reliability, better performance, and lower operating costs. Additional upgrades will lead to even greater safety, reliability, and efficiency.

Mr. Chairman, the Space Shuttle is safer and more efficient than ever and an excellent example of how a major government program can be operated more efficiently for less money. Consider the following:

- In fiscal year 1992, the annual space shuttle budget was \$3.9 billion—today it is \$3 billion.
- Since USA signed the prime contract in 1996, metrics used to measure safety have shown a dramatic improvement.
- At the same time USA has contributed to shuttle cost savings of \$267 million in 1997 and 1998; plus an additional \$192 million in savings are projected for this year.
- USA has invested back into the program its share of contract underrun funds for system improvements. The Space Shuttle's on-time record is nearly perfect over the last three years, building on an outstanding record already started by NASA.
- Core jobs that required 15,000 people in fiscal year 1992 need only 8,900 in fiscal year 1998.

By investing in upgrades, the Space Shuttle will continue to meet the challenges in the next century. As has been proven with commercial and military aircraft, technology upgrades can extend the life of aircraft and return great value to the taxpayer. In this way we can assure that the unique capabilities of the Space Shuttle—still unmatched in the world for the foreseeable future—are available to our country in the next century.

Therefore, we ask your Subcommittee to support the following request: Support the NASA fiscal year 2000 budget request of \$13.578 billion, particularly funding for the Space Shuttle, the International Space Station, and Space Shuttle Upgrades; and, provide an additional \$25 million in NASA Shuttle Upgrades funding to continue investing in technology that improves Space Shuttle safety, productivity, reliability, and performance.

PREPARED STATEMENT OF THE AMERICAN MUSEUM OF NATURAL HISTORY

Good morning Mr. Chairman and Members of the Committee. My name is Ellen Futter and I am the President of the American Museum of Natural History. I very much appreciate the opportunity to submit to you today a summary of our recent activities and our fiscal year 2000 plans and objectives. Most of all, I want to thank this Subcommittee for the contributions it has made to scientific research and education in this nation.

Founded in 1869, the American Museum of Natural History is one of the nation's pre-eminent scientific and educational institutions drawing four million visitors on-site annually and another four million to our website. For over 129 years, the Museum has pursued a mission of examining critical scientific issues and increasing public understanding about them. More than 200 active research scientists, many with internationally recognized expertise, conduct more than 150 field projects each year. In fact, since its founding, the Museum has sponsored tens of thousands of expeditions, sending scientists and explorers to every continent. This rich scientific

legacy includes a collection of approximately 32 million natural specimens and cultural artifacts that together form a record of life on earth.

Early in the year 2000, the Museum will begin a new chapter in its history with the opening of the new Rose Center for Earth and Space, including a rebuilt and scientifically cutting-edge Hayden Planetarium and a new Hall of the Universe and Hall of Planet Earth. With the construction of the Rose Center, the Museum will better join science and education to provide a seamless educational journey taking visitors from the very beginnings of the universe, to the formation and physical processes that exist on Earth to the extraordinary and irreplaceable diversity of life and cultures on our planet.

Consistent with the federal government's stated commitment to an interagency and multi-disciplinary direction, the Museum's ongoing scientific research and educational programming increasingly emphasizes an interagency and multi-disciplinary approach. Under the leadership of Congress, the American Museum of Natural History has fostered a close scientific and educational partnership with NASA. As you know, unlike any other federal agency, NASA has captured the imagination of the American public and reinvigorated a national thirst for exploration into previously unknown realms.

The fiscal year 1998 Congressional appropriation enabled the Museum to launch the National Center for Science Literacy, Education, and Technology ("the National Center") in cooperation with NASA. In the National Center NASA and the Museum joined resources to create programs that neither one could do as effectively on its own. This extremely productive partnership rests largely on the shared goal of fostering scientific literacy nationwide. The National Center creates materials and programs that reach beyond our institutional walls into homes, schools, museums, libraries, and community organizations around the nation. NASA's partnership with the National Center has fueled four major components: the Educational Materials Laboratory, Electronic Science Bulletins, Digital Galaxy Mapping Project, and the Black Smoker Expedition and Educational Initiatives.

The Educational Materials Lab develops materials and programs to bring cutting-edge science to formal and informal science education settings across the country. One such program, Biodiversity Counts, is now in more than 100 schools nationwide as a middle-school curriculum.

Three interrelated efforts—the BioBulletin, GeoBulletin, and AstroBulletin—gather, interpret, and transform data and images into comprehensive, digital "snapshots" of events, research, and phenomena in global and cosmic systems displayed in the new permanent exhibition halls. Information displayed in the Bulletins is reinterpreted for dissemination via the World Wide Web, and can be compiled into digital almanacs or bulletins distributed on CD-ROMs and in other media. The BioBulletin centers on global biodiversity, the GeoBulletin will track data about climate systems, and the AstroBulletin will include images from NASA and other observatories, as well as updates on NASA missions, images and information about astronomical events.

The Digital Galaxy brings together diverse data sets to create the first scientifically accurate three-dimensional map of the Milky Way Galaxy. The Hayden Planetarium Space Theater was part of the principal motivation for the Digital Galaxy project. The Space Theater will feature the most advanced real-time digital dome projection system in the world. This project will showcase data from NASA and make it available for widespread public use. It will also explore new ways of compiling, interpreting, and communicating complex scientific data to the public in ways that are engaging, entertaining and highly educational.

A team of Museum scientists and educators has successfully participated in an expedition with the University of Washington to recover four "Black Smokers," sulfide structures located on the deep ocean floor on the Juan de Fuca ridge, off the coast of Washington. Nine teachers accompanied scientists on this expedition and experienced the process of scientific discovery. They also contributed to the Black Smoker Web site journals and will take their experiences back to their classrooms. The National Center plans to develop earth-science curriculum materials inspired by the themes in the Hall of Planet Earth, including the retrieval of and learning from the Black Smoker.

We have recently expanded our work with NASA to meet our common goals of exploring and developing ways to understand the earth, its biodiversity, and the history of life in the universe. By joining the Museum's massive biological collections, accumulated over the last 129 years and extending back hundreds of millions of years, with NASA's enormous datasets, this partnership will effectively address the goals of NASA's new investments in interdisciplinary research in biology, earth science, and space science. Our partnership with NASA will greatly enhance biological research by focusing on four key areas: (i) incorporation of satellite technology

into biodiversity conservation; (ii) utilization of DNA sequencing in systematics and conservation; (iii) improving collections by adding compact storage and a super-cold tissue storage for microbial and molecular biology; and (iv) use of digital imaging technologies for improved perception of specimens and dissemination of research.

The Museum now seeks to extend and broaden the relationship between the American Museum's National Center for Science Literacy, Education and Technology and NASA by expanding the role of NASA in the new Rose Center with the goal of educating a broader segment of the American public. We are seeking, therefore, a fiscal year 2000 NASA investment of \$5 million to support an expand the Educational Materials Lab, which is accessed by millions of Americans, and will include the development of additional curriculum modules from prototypes created in the first phase of the National Center's NASA grant in the areas of Tools for Making Sense, Black Smokers, Hall of the Universe, and Digital Galaxy. In addition, we seek to deepen and broaden our partnership with NASA in the realm of the Digital Galaxy by bringing this astounding compilation of information to teachers, students, and the general public through an easily accessible format such as a data archive and coordinated website. We plan to develop an on-going Digital Dome visualization project that will contain a NASA "news" element that will highlight current NASA priorities such as progress in the space station and new astronomical discoveries. These elements can then be integrated into the planetarium space theater presentations for greater public access. In partnership with NASA, we seek to implement a second phase of the highly successful Electronic Science Bulletins that were instituted under the first NASA agreement.

This is our agenda for the coming years. Much of the support for research, exhibition, and education comes from foundations, corporations, and individuals. However, it is significant that we have been able to leverage federal funding such as that from NASA with the result that the support has been matched many times over by private dollars. We seek a similar public/private partnership for our further federal collaborations. The American Museum of Natural History is deeply appreciative of the support of this Subcommittee and looks forward to continuing and strengthening this fruitful partnership. Thank you again, Mr. Chairman and Members of the Committee, for all of your support.

NATIONAL SCIENCE FOUNDATION

PREPARED STATEMENT OF THE NATIONAL CORN GROWERS ASSOCIATION

The National Corn Growers Association, representing 30,000 corn growers in 47 states, appreciates the opportunity to provide you with our recommendations regarding fiscal year 2000 funding for the National Science Foundation's Plant Genome Initiative. We appreciate the Chairman's leadership and the support of this Subcommittee for this Initiative. This program is laying the foundation for agricultural research in the 21st Century.

We are at a critical juncture in plant genomics, one comparable to that faced in human genomics this past year. Last year, two companies announced that they were going to sequence the entire human genome and obtain patents on the data. In response, the National Institutes of Health (NIH) pumped an additional \$80 million into the human genome project. They accelerated the project to ensure that vital genome data and materials remained publicly available.

Many other countries and companies have announced major initiatives in plant genomics and have announced intentions to file patents on fundamental plant genomics data. Earlier this month, a company announced that it planned to sequence the entire rice genome and to create a commercial database for which companies would be required to pay \$30 million to have five years of access. Because of the similarities between crops, the patenting of rice genomic data will affect research on every crop, including corn. Most companies and public sector scientists at universities and within the Federal government will not have the financial wherewithal to have access to the data unless Congress acts swiftly to increase the Federal effort in plant genomics.

We urge Congress to respond to the recent announcement in the same manner that the NIH did last year by providing a significant increase in funding for the NSF Plant Genome Initiative. We urge you to provide not less than \$70 million for the NSF plant genome initiative. We recognize that this will be extremely difficult due to budgetary constraints. However, we believe that we cannot be complacent about maintaining access to fundamental plant genomic data.

In January 1998, the National Science and Technology Council issued an Interagency Working Group report on the National Plant Genome Initiative. The report

stated that the time was right for the implementation of a comprehensive, five-year National Plant Genome Initiative to meet the major challenges that will face mankind in the 21st Century. In the transmittal letter accompanying the report, the President's science advisor, Dr. John H. Gibbons, stated the following:

"The timing of this initiative is critical, since our international and private sector partners are moving forward aggressively. A significant public sector program . . . carried out in partnership with industry will ensure plant genome data and materials are openly accessible to all scientists. It is a critical step toward promoting future scientific breakthroughs in plant biology and their practical application."

The Interagency Working Group on Plant Genomes estimated that \$400 million in funding was needed, over five years, to accomplish the short-term goals of the National Plant Genome Initiative that focus on building plant genome research infrastructure. However, funding for the initiative has fallen far short of that needed to meet the \$400 million level. Fiscal years 1998 and 1999 provided only \$90 million for the effort. If full funding had been provided from the very beginning, it is possible that we would not be faced with losing accessibility to vital plant data today.

The Plant Genome Initiative is, critically, important to the nation's corn growers and to the nation's consumers. While world population continues to expand and protein demand increases exponentially, there is an expectation of higher quality, safer, and more nutritious food. These accelerating demand pressures mean that existing resources of land, water, and nutrients must be used more effectively if the supply of food, feed, and fibers is to remain in balance with world needs.

The NCGA believes that the future of the corn industry is written in corn's genetic code. The NCGA concurs with Philip H. Abelson's statement, in a recent *Science* editorial, that we are in the early phases of the third technological revolution—a genomics revolution and that ". . . the greatest ultimate global impact of genomics will result from manipulation of the DNA of plants." As he stated, "ultimately, the world will obtain most of its food, fuel, fiber, chemical feedstocks, and some of its pharmaceuticals from genetically altered vegetation and trees." (*Science*, Vol. 279, p. 2019.)

The Plant Genome Initiative supports research that advances our understanding of the structure, organization and function of plant genomes, and accelerates utilization of new knowledge and innovative technologies toward a more complete understanding of basic biological processes in plants. The primary focus of the PGI is on economically significant plants, such as corn. The Plant Genome Initiative will help scientists, geneticists, and plant breeders identify and utilize genes from corn and other economically significant crops that control important traits, such as nutritional value, stress tolerance, and resistance to pests. The far-reaching benefits of this Initiative include:

- Protection of U.S. interests and access to important biotechnology and gene patents and basic plant genome data;
- Retention of U.S. leadership in cutting edge research;
- Revitalization of rural America due to a more robust agricultural sector;
- Expansion of plant-based renewable resources for energy and raw materials;
- Significant reductions in crop losses and reliance on pesticides through improved biological methods to control and alleviate serious industrial threats and targeted pests;
- Improved yields and reduced crop losses caused by adverse environmental conditions such as heat, drought, and salt;
- Improved nitrogen-use efficiency, thereby, limiting the potential for nitrates in the water supply;
- Reduced environmental problems confronted by livestock producers, such as modifying the digestibility of phosphorous in feed corn to reduce the amount of phosphorous that enters our ground water;
- Improved animal nutrition leading to healthier meat and increased meat productivity;
- Reductions in the occurrence of mycotoxin contamination by significantly improving resistance to fungal infection;
- Development of tailored hybrids with valuable specialty starches, oils, and protein content; and
- Reduced worldwide malnutrition due to higher yielding and more nutritious crops.

The Plant Genome Initiative is critical to the long-term viability of U.S. agriculture. To compete in the global market, the U.S. must continually strive to efficiently and economically improve production capabilities—to maximize yield and combat serious threats from disease, pests, and climate changes—without harming the environment. Genomics research holds the key to achieving this goal.

A significant increase in funds will help the US to remain at the cutting edge of plant genomics and will help guarantee that we have continued access to fundamental plant genome data. This is the number one appropriations issue for the National Corn Growers Association. We urge you to provide not less than \$70 million for the NSF Plant Genome Initiative to ensure that our growers have the tools to meet the challenges and demands of the 21st century.

Thank you for allowing us to share our views on the fiscal year 2000 VA, HUD appropriations bill.

PREPARED STATEMENT OF THE AMERICAN PSYCHOLOGICAL SOCIETY,

Mr. Chairman, Members of the Subcommittee: Thank you for the opportunity to submit this statement on the fiscal year 2000 appropriations for the National Science Foundation. I am Alan Kraut, Executive Director of the American Psychological Society (APS). APS's 15,000 members are scientists and academics who conduct research in cognition; memory; auditory and visual perception; decision-making; human development; emotions; and group behavior, to name just a few topics. To summarize the main points of my testimony:

- As a member of the Coalition for National Science Funding, APS supports the Coalition's recommendation that the NSF budget be increased 15 percent in fiscal year 2000.
- We ask the Subcommittee to significantly increase the fiscal year 2000 budget for NSF's behavioral and social science research divisions to support the reorganization of those divisions and to allow the initiation of programs in emerging areas such as cognitive neuroscience.
- Disparities in the length and duration of NSF grants in behavioral and social science compared to other NSF grants mean that the behavioral sciences continue to be underfunded. We ask the Subcommittee to encourage the elimination of these funding disparities at NSF, recognizing this would require some "catch-up" funding for these disciplines.
- We ask the Subcommittee to support the establishment of small grants at NSF specifically designed to sustain new investigators in the behavioral sciences at a critical junction in their career.

I want to begin by expressing our appreciation for the substantial increase that Congress provided for NSF in fiscal year 1999. That increase has made a difference throughout the agency and particularly in the programs that I know best, those that support psychological science. It is our position that this general growth needs to continue at NSF in fiscal year 2000. As a member of the Coalition for National Science Funding (CNSF), APS supports the Coalition's recommended 15 percent increase for NSF in fiscal year 2000, for a total appropriation of \$4.3 billion. The President's request this year is a 5.8 percent increase, but a substantial portion of that is in information technology. We support increased funding for information technology—this will benefit science as well as the public. However, it should not be at the expense of other areas which also provide essential scientific knowledge. The CNSF recommendation would allow a balanced distribution of increases in the fiscal year 2000 budget.

Social and Behavioral Structure and Funding.—I'll talk about some of the initiatives that are being funded in fiscal year 1999 in a moment, but first, within the context of NSF's overall budget, I'd like to discuss some of the agency's policies as they affect basic behavioral and social science research. For the past several years, this Subcommittee has strongly encouraged these areas at NSF. Your support was instrumental in establishing the Social, Behavioral and Economic Sciences Directorate—known as SBE—and later in strengthening it. You also were instrumental in helping the Directorate expand its Human Capital Initiative program. Most recently, this Subcommittee, along with your colleagues in the House, expressed strong support for the planned reorganization of SBE's single research division into two separate divisions. I am pleased to report that the final touches to this reorganization have now taken place, and the SBE directorate has a Behavioral and Cognitive Sciences Division, and a Social and Economic Sciences Division.

This reorganization will enable NSF to accommodate the explosive pace of discovery in the behavioral and social sciences and to promote partnership with other disciplines. There was just too much breadth and depth in these fields to be contained in one research division. However, the reorganization is just a beginning. Providing a critical mass of funding is the next step.

The President's budget request includes a 5.3 percent increase for NSF's behavioral and social science research programs, which would bring them to just over \$106 million for fiscal year 2000. We appreciate the proposed increase, but it is also

clear that additional resources are needed if the two new divisions are to sustain the scientific momentum that led to the reorganization. We ask the Subcommittee to support a significant increase in the NSF budget for behavioral and social science research programs in the SBE directorate.

In addition, we are asking the Subcommittee to encourage NSF to increase the average amount and the duration of awards in the behavioral and social sciences. The average length of an award in the behavioral and social sciences is only 2 years, compared with the NSF-wide average of 2.7 years. Further, the average grant in these areas receives \$20,000 less than the average NSF-wide grant. These disparities exacerbate the underfunding that NSF's behavioral and social science research experiences, both in terms of the number of grant proposals that are funded compared to the number submitted, and in comparison to overall budget levels in other areas of science. We ask the Subcommittee to encourage NSF to examine its support for these essential areas, and to stress that any plan to provide additional equity among the sciences will not be accomplished through a reduction in the number of awards made in these disciplines.

Young investigator mechanisms.—The need to support the next generation of scientists is especially acute in basic research in the behavioral and social sciences. The underfunding of our fields has an impact beyond principal investigators whose proposals aren't being funded. It jeopardizes the supply of high-quality future investigators who would otherwise receive training under those grants. The beginning of an investigator's career is an important juncture; it is a time when a relatively new PhD should be collecting initial data and gaining experience that is often necessary to later compete for larger grants. In order to protect our "seed corn" investigators, we suggest that NSF use a mechanism such as NIH's B/START (Behavioral Science Track Awards for Rapid Transition) grants, which provide small amounts of funding specifically to sustain new investigators at that critical time in their careers. We ask the Subcommittee to encourage the establishment of small grants such as B/START at NSF for new behavioral and social science investigators.

SOCIAL AND BEHAVIORAL SCIENCE INITIATIVES

The remainder of my testimony describes specific initiatives at NSF that are being funded in the current year. These illustrate the important work in my own field, psychological science, that is being supported by NSF's behavioral and social science programs, and how this work is combined with many other disciplines. By expanding NSF's capacity in these areas, you would be allowing much more of this kind of work to be done. The increase we are requesting will allow NSF to increase the number of grants funded under these initiatives, plus the agency will be able to launch additional initiatives in fiscal year 2000.

Knowledge and Distributed Intelligence.—Research in Knowledge and Distributed Intelligence (KDI) is an NSF-wide priority for fiscal year 2000 and is funded by all six NSF research directorates. Behavioral science is a core area of the initiative, which is using interdisciplinary research to examine such phenomena as learning and memory, social cognition, human-computer interactions, and visual and auditory perception. This initiative involves research in areas ranging from neuropsychology to cognitive science to social and developmental psychology.

Of the nearly 700 research proposals received by the KDI program, 40 were funded, and of those 40, about a quarter included a significant cognitive, behavioral or psychological science aspect. Here are some examples of projects on which psychological scientists are serving as principal investigators:

- At the University of Pittsburgh, investigators on a KDI project called Computational Models and Coordinated Neuroimaging of Learning and Cognitive Function will be mapping human brain function and developing computational models of brain structures involved in human cognition.
- In Virtual Environments and Behavior, a KDI project at the University of California, Santa Barbara, scientists will be using immersive virtual environment technology (IVET, a state-of-the-art research tool which creates illusory physical and social surroundings) in four areas of basic research: education and learning, visual perception, spatial cognition and social psychology. Among other things, they will study social interactions in virtual environments and how people develop natural interactions under virtual circumstances. IVET is already invaluable to many areas of psychological research, and one primary goal of the project is to expand the use of IVET in social psychology research.
- In a KDI project at Michigan State University, titled Sequential Decision Making in Animals and Machines, investigators from cognitive psychology, computer science, and zoology will be examining issues that cut across biological and artificial intelligence, yielding knowledge that will be relevant to many disciplines.

—In a project with the complicated title of Segmental and Prosodic Optical Phonetics for Human and Machine Speech Processing, psychologists and others from the House Eye Institute at UCLA will be studying fundamental issues in visual speech perception and optical speech synthesis. Specifically, they will be characterizing optical speech signals and examining how optical speech characteristics relate to acoustic and physiologic speech characteristics.

Enhancing Infrastructure for the Social and Behavioral Sciences.—In social and behavioral science, the term “infrastructure” refers to large, innovative and long-running projects that involve data bases, technology, some longitudinal research, and other resources useful across a wide base of scientific inquiry. NSF has historically supported several important infrastructure initiatives in the behavioral and social sciences. In fiscal year 1999, the SBE launched a new infrastructure initiative that among other things will capitalize on the expanding capabilities of the World Wide Web to bring data, researchers and experimental facilities together electronically in arrangements that are being called “collaboratories.” These collaboratories will enable scientists from different geographical locations to jointly conduct real-time controlled experiments and to share the use of expensive experimental equipment. More generally, it allows a greater number of scientists to be involved in, and gain results from, research in progress. Other infrastructure activities will involve large-scale surveys, electronic databases and archives that can be accessed through the Web, and interdisciplinary research centers that develop innovative methods of collaborative research activity.

The fiscal year 1999 round of proposals have been received, and since the review process is under way we don’t yet know what specific proposals will be funded. But I am sorry to report that with the current level of funding, \$3 million, only a very few of the 100 proposals received—perhaps as few as 4 or 5—will be funded under this infrastructure initiative.

Child Learning and Development.—Another initiative to be funded in fiscal year 1999 is in the area of child learning and development. This multidisciplinary competition will support research that increases our understanding of cognitive, social, and biological processes involved in learning, with particular emphasis on new theories and methods for studying learning and child development. Specific issues to be addressed include: the development and transfer of knowledge in specific subject areas; the effects of peer relationships, family interactions, and other social factors on learning; the impact of family, school and community resources on learning and development; and the role of demographic and cultural characteristics in learning and development. A minimum of \$2 million will be available for this initiative in fiscal year 1999, and it is anticipated that 15–20 of the 60 proposals received will be funded.

Cognitive Neuroscience.—I would also like to briefly highlight an area where NSF is seeking to increase its activities. The emerging field of cognitive neuroscience combines behavior and biology in a multi-disciplinary approach to understanding the mind. The result is a new approach to unraveling the complexities of mental processing and the underlying biological intricacies. Drawing on theoretical advances in cognitive science and technological advances in brain imaging, this field has significant implications for our understanding of memory, learning, perception, emotion, of virtually any brain-based behavioral process. Cognitive neuroscience has potential applications in education generally, and in diagnosing and treating learning disabilities and assessing cognitive ability in cases of disease and trauma, among other things.

NSF is in an excellent position to expand and strengthen the field of cognitive neuroscience. We ask the Subcommittee to support the development of a cognitive neuroscience initiative at NSF and to provide new funding in fiscal year 2000 to help launch a program in this area.

This concludes my statement. I would be pleased to answer any questions.

LETTER FROM THE UNIVERSITY CORPORATION FOR ATMOSPHERIC RESEARCH

UNIVERSITY CORPORATION FOR ATMOSPHERIC RESEARCH,
NATIONAL CENTER FOR ATMOSPHERIC RESEARCH,
Boulder, CO, April 22, 1999.

Hon. CHRISTOPHER BOND,
Chairman, Subcommittee on VA, HUD and Independent Agencies,
Senate Appropriations Committee, Washington, DC.

DEAR MR. CHAIRMAN: On behalf of the University Corporation for Atmospheric Research (UCAR) and the university community involved in weather and climate research and related support activities, I would like to submit this letter for the record

of the U.S. Senate Committee on Appropriations, Subcommittee on VA, HUD and Independent Agencies.

UCAR is a university membership consortium composed of 63 U.S. and Canadian institutions that grant the Ph.D. in atmospheric, oceanic, and related sciences. It is a not-for-profit Colorado corporation established in 1959 to support, enhance, and extend the capabilities of the university community, nationally and internationally; to understand the behavior of the atmosphere and related systems and the global environment; and to foster the transfer of knowledge and technology for the betterment of life on earth. UCAR manages and operates the National Center for Atmospheric Research (NCAR) and the UCAR Office of Programs (UOP). UCAR is supported by the National Science Foundation (NSF) and other federal agencies including the Department of Energy (DOE), National Aeronautics and Space Administration (NASA), the National Oceanic and Atmospheric Administration (NOAA), the Environmental Protection Agency (EPA), the Department of Defense (DOD), and the Federal Aviation Administration (FAA).

We appreciate the opportunity to submit written testimony on the proposed fiscal year 2000 budgets for the following agencies:

THE NATIONAL SCIENCE FOUNDATION (NSF)

We urge the Committee to support the overall proposed budget of \$3.95 billion for the National Science Foundation (NSF) for fiscal year 2000, a 5.8 percent or \$217 million increase over fiscal year 1999. NSF is a critical source of funding for the research and education activities of our community and the welfare of the nation. Scientific advances funded by NSF over almost 50 years of service have helped to fuel the vibrant economy that makes the U.S. the strongest country in the world.

Within the NSF, we would like to provide written testimony on the following specific programs:

New Initiatives

The new Information Technology for the 21st Century (IT²) initiative is funded at \$146 million, \$110 million in NSF's CISE Directorate and \$36 million in NSF's Major Research Equipment Account. IT² has the potential to address the critical supercomputing needs for science in the U.S. Our nation has lagged behind other developed nations in high-end computing, a situation that will adversely affect our economy and has already impacted the atmospheric science community's position of scientific leadership. As the atmospheric sciences community strives to learn more about the effects of solar variability on the earth's atmosphere, space weather that impacts satellite communications, climate variability and weather patterns, the need for computational power grows. We do not have the computation tools to effectively address many of our nation's weather and climate policy issues. This is particularly important as we get closer to the next round of international climate change assessments in 2004. If investments in basic information technology are made in concert with the computational science needs of the weather and climate community, our nation will get significantly larger return on these IT² investments.

The exciting Biocomplexity in the Environment (BE) initiative, funded at \$50 million in the new Integrating Activities line, will explore the complex interdependencies among living organisms and the environments that affect, sustain, and are modified by them. We expect that contributions can be made to this effort from across the science and engineering community. In fact, we believe the atmospheric and related science community is well positioned to contribute, including proposing the integration of biogeochemistry, especially the carbon cycle, into NCAR's Climate System Model, one of the world's premier, fully-coupled, climate system models.

We urge the Committee to support the new IT² and Biocomplexity initiatives.

Geosciences Directorate

We urge the Committee to support the proposed fiscal year 2000 budget of \$485.48 million for NSF's Geosciences Directorate (GEO). We are concerned, however, that this represents only a 2.6 percent increase over the fiscal year 1999 Current Plan of \$472.98 million. Given inflation factors, this amount allows little or no enhancement of the work supported by GEO focusing on the atmospheric, earth and oceanic sciences. GEO is the principal source of funding for university-based research addressing the nation's ability to understand, predict and respond to environmental events and changes. As our ability increases to do more complex research on the interactions of the earth's systems, so do the costs of research tools such as computation time and instrumentation. In future years, we believe that the GEO budget should increase in proportion to its key role in this critical area of research and that the following components of the GEO budget should increase accordingly.

We urge the Committee to support the proposed fiscal year 2000 budget of \$164.00 million for Atmospheric Sciences (ATM) within NSF's Geosciences Directorate, a 2.7 percent increase over the fiscal year 1999 Current Plan. The ATM Sub-activity within GEO funds university research activities as well as the country's large research facilities that further our understanding of weather, climate, and the solar-terrestrial environment. Research studies include understanding the behavior of weather and climate on all scales, the chemistry and chemical cycles of the earth's atmosphere, and the sun as it relates to the Earth's atmosphere and space environment.

Within ATM, we urge the Committee to support the proposed fiscal year 2000 budget of \$68.15 million for the National Center for Atmospheric Research (NCAR), a 2.7 percent increase over the fiscal year 1999 Current Plan. This world-class center for atmospheric research supports the broad atmospheric sciences community through observational and computer facilities, instrumented research aircraft, and an extensive visiting scientist program. In fiscal year 2000, NCAR will continue the badly needed refurbishment of the NCAR Mesa Laboratory building at a level of \$4.0 million. This \$12 million, multi-year refurbishment was begun in fiscal year 1999 and will ensure that NCAR's primary building will continue to serve the scientific community at the highest level.

U.S. global change research program

We urge the Committee to support the fiscal year 2000 proposed budget of \$187 million for the U.S. Global Change Research Program (USGCRP) within NSF. The USGCRP is an interagency program that addresses interactions among physical, biological, ecological, and human systems at various scales. Working with national and international research institutions, this program allows the atmospheric sciences community to improve prediction capabilities for climate fluctuations between excessively wet and dry periods, and for long-term climate change. This research is a critical investment for the future of this nation, its economy, and the health and safety of its citizens.

U.S. weather research program (USWRP)

NSF and the National Oceanic and Atmospheric Administration (NOAA) are partners in the USWRP, a program designed to bring the operational and research weather communities together to extend the way in which we utilize the technologies of the National Weather Service's \$4 billion Modernization Program. USWRP was authorized by Congress in 1992 and an implementation plan for \$130 million over five years was submitted to Congress in 1994. According to that plan, the fiscal year 2000 USWRP funding level for NSF and NOAA should be \$12 million each for a total of \$24 million. We were discouraged to see that NOAA's proposed fiscal year 2000 funding for USWRP is only \$1.5 million. The program is mentioned in the NSF budget, but no dollar amount is specified. The disaster relief savings realized through USWRP research on hurricane landfall and heavy precipitation could be many times the initial investment. We urge the Committee to fully fund the USWRP in NSF's fiscal year 2000 budget.

High-performance instrumented airborne platform for environmental research (HIAPER)

The atmospheric sciences community were extremely disappointed when HIAPER was omitted from NSF's Major Research Equipment (MRE) account in the fiscal year 2000 proposed budget. This high-altitude, modern research aircraft has been approved by the National Science Board and was slated to begin funding in fiscal year 2000. The scientific need for HIAPER is well documented. The study of the upper atmosphere is vital to the understanding of how severe weather and other climate phenomena develop and impact the nation and the globe. The aircraft is scheduled to be operational five years after funding begins. Since at least one other aircraft currently in service at NSF will end its useful lifetime in the next five years, we urge the Committee to provide a modest start for HIAPER within NSF's MRE account in fiscal year 2000, provided it doesn't significantly impact other NSF initiatives.

The National Aeronautics and Space Administration (NASA)

We urge the Committee to support proposed funding for Solar B within NASA's Solar Research account. Solar B is part of NASA's Solar-Terrestrial Probe (STP) program and, from what we understand, is recommended at the full funding level for fiscal year 2000. Solar B is a collaboration with Japan to carry out a series of highly focused satellite missions to study the Sun and its many influences on the Earth and other planets. The data gathered should help us understand events such as

solar flares that can hit Earth's atmosphere with enough force to cause extremely expensive and dangerous communications disruptions.

We understand that the High Resolution Dynamics Limb Sounder (HIRDLS) instrument is fully funded through the Earth Observing System's chemistry mission of NASA's Office of Earth Science and we urge the Committee to maintain that support. We are pleased with the progress achieved for the HIRDLS instrument, scheduled for flight on the Chemistry platform of the Earth Observing System. HIRDLS is being jointly developed with the United Kingdom and with extensive participation by the U.S. academic community. It will return observations with unprecedented detail, notably on the transition region between the troposphere and stratosphere. These data will enable detailed studies of chemical and dynamical processes that are fundamental to improved understanding of global change.

On behalf of the atmospheric sciences community, I want to thank you for the important work you do for U.S. scientific research, education, and training. We appreciate your attention to the recommendations of our community concerning the fiscal year 2000 budget.

Sincerely,

RICHARD A. ANTHERS,
President.

PREPARED STATEMENT OF THE BOARD ON HUMAN SCIENCES OF THE NATIONAL
ASSOCIATION OF STATE UNIVERSITIES AND LAND GRANT COLLEGES

Mr. Chairman and members of the committee: My name is Patricia Knaub. I am Dean of the College of Human Environmental Sciences at Oklahoma State University. This testimony is in behalf of the Board on Human Sciences of the National Association of State Universities and Land Grant Colleges (NASULGC). The Board on Human Sciences (BOHS) represents those State Universities and Land Grant Colleges which conduct research, extension and education programs on nutrition and health, food safety and product development, p K-12 teacher education, workforce development, human development, family and community viability. Our work is supported by federal, state, and privately funded grants as well as CSREES formula funds and USDA competitive grants programs. In 1998 member colleges reported \$1.5 million in projects supported by NSF. Some of our colleges are located in major research institutions and several others are located in EPSCoR designated institutions.

The BOHS strongly supports the National Science Foundation initiatives outlined in the fiscal year 2000 budget proposal. Our member colleges are prepared to carry out work in support of several of these initiatives, especially aspects of Information Technology for the 21st Century (social, economic, and workforce impacts of technology); Educating for the Future: A 21st Century Workforce; and encouragement of scientific participation of underrepresented groups.

INFORMATION TECHNOLOGY FOR THE 21ST CENTURY

The IT² initiative places emphasis on enhancing the fundamental capacity of technology to support scientific investigation but also recognizes the critical need to develop and maintain literacy of the workforce at all levels to use current and new technology in the application and dissemination of scientific advances. Workers in America are being displaced because their jobs become obsolete or change with the advent of technology. They must be retrained. Users of information available via technology need support in accessing information and in verification of its quality.

EDUCATING FOR THE FUTURE: A 21ST CENTURY WORKFORCE

A generation caught between low and high technology must be retrained or redirected into economically viable jobs, but the emerging generations of workers must be prepared to utilize available and new technologies to become employable. The pairing of graduate assistants and undergraduates with p K-12 learners and their teachers not only provides direct assistance, but reinforces skills being learned by these graduate and undergraduate students. A long term technology literate workforce is likely to be assured with such pairings.

HUMAN SCIENCE RESEARCHERS AND EDUCATORS RESPOND

Human science researchers and educators in all 50 states are conducting programs which directly address the issues identified as fiscal year 2000 NSF priorities. Extension educators work directly with displaced workers in need of technological skills and teacher educators conduct programs to enhance the scientific lit-

eracy of p K–12, but also conduct programs which increase interest in science as a career. Further, all human science faculties are linked through the Board on Human Sciences so that interstate and interdisciplinary programs can be carried out and information freely exchanged across the country.

Workforce Transition.—Consortia of human sciences colleges in several states are providing coursework, degree programs, or skill upgrade workshops to help place-bound workers' transition from jobs which no longer exist. These opportunities are being made available by distance learning technologies so that learners can remain at home or study at times available around work schedules. Not only do these opportunities retrain workers with new marketable skills, it familiarizes them with the use of technology, enhancing their marketable skills.

Educating for the Future 00 Faculty and p K–12 teachers have developed science programs which introduce fundamental science knowledge via subjects of interest to students. For example, a program based upon food safety has been introduced into biology and chemistry classes. Science teachers are introduced in summer sessions to course materials on food safety. Similarly, high school students participate in textile and polymer science summer courses working with graduate students on research projects. A member Human Sciences college is currently conducting an NSF funded project teaching textile and polymer science to non-science university students.

Serving underrepresented groups.—Human sciences faculty in 1862 Land Grant Universities team with Faculty in 1890 and 1994 LGU institutions in undergraduate/graduate/faculty exchanges to work on joint research projects in nutrition, food product development, and dietetics. In several cases these are funded projects resulting in enhanced institutional capacity as well as collegial enhancement.

The Board on Human Sciences welcomes these well targeted initiatives for fiscal year 2000. Human Sciences faculties contribute significantly to the programs addressed in this budget as outlined above. Support for this budget can help assure that contribution. Thank you or the opportunity to comment. We urge your support of these initiatives.

PREPARED STATEMENT OF THE STATE AGRICULTURAL EXPERIMENT STATIONS

Mr. Chairman, members of the subcommittee: On behalf of the State Agricultural Experiment Stations (SAES), I appreciate the opportunity to appear before you to discuss the importance of research and the National Science Foundation (NSF). The SAES comprise a nationally coordinated system of experiment stations that serve as the research arm of the Land Grant Universities (LGUs). The mission of the SAES is to generate knowledge and technology to support a highly diversified agricultural and natural resource system that produces, processes and delivers a high quality, safe, affordable and abundant supply of food, fiber and forestry products.

In support of its mission, SAES seeks to broaden partnerships with other agencies, including NSF, that are involved in agriculture and natural resource management programs and research. SAES is committed to improving the technology and information base by capitalizing on the LGU comparative advantages in research, education, and extension.

PARTNERING WITH NSF AND OTHER AGENCIES

Many agencies such as NSF share similar research priorities and goals that can be utilized to develop more effective programs. Many initiatives and goals are targeted to specific agendas, however a more thorough inventory of research priorities can be assessed through collaborative discussions and pooling of resources. Through a variety of means, partnerships with NSF and other agencies increase:

- number of funding awards from agencies going to LGUs;
- the amount of LGU participation in Agency peer review processes;
- the quantity/quality of proposals submitted by the LGUs for Agency funded competitive grants;
- the exchange of scientists between LGU institutions and agencies for collaborative projects.

NSF FISCAL YEAR 2000 BUDGET PROPOSAL

The SAES strongly support the priorities outlined in the NSF fiscal year 2000 budget proposal including:

Information technology for the 21st century (IT²)

This initiative requests \$146 million across two components: \$110 million for fundamental information technology research (Software systems, scaleable information

infrastructure, high-end computing, and social, economic, and workforce impacts of information technology). An additional \$36 million is designated for tetrascale computing systems allowing researchers access to leading edge computational systems. According to NSF, 60 percent of this will go to support university-based research. This program will help address the need to better manage and utilize information and technologies produced and disseminated by the Land Grant University system.

Biocomplexity in the environment

\$50 million is requested to better understand:

- Biodiversity and ecosystem dynamics, diversity of life responses to changes in land, water and air,
- Environment and the human dimension, the impact of population distribution and human decision-making on environment and global change, and
- global and environmental change including earth system history, tectonics, glaciology and hydrology.

Given that one of the five major goals of the Land Grant University system is to address greater harmony between agriculture and the environment, the LGUs bring a high level of expertise in the area of biocomplexity in the environment to the table. Our system supports this investment and stands ready to work with NSF to address these critical issues.

Plant genome research

NSF proposes a \$55 million investment to advance understanding of plant structure and function, with emphasis on economically significant plants, and advance use of new knowledge and innovation technologies toward basic biological processes. The mapping of genomes of economically important crops and other plants has tremendous implications for agricultural production and processing, food safety and quality and environmental protection. Increased investment in this area of research is extremely important and the competitive grants provided by NSF facilitate continued partnerships between the NSF, Land Grant Universities, USDA/ARS, Department of Energy and the private sector.

Experimental program to stimulate competitive research (EPSCoR)

An investment of \$48 million is proposed for the Experimental Program to Stimulate Competitive Research (EPSCoR). EPSCoR targets those states that have historically received lesser amounts of Federal R&D funding and have demonstrated a commitment to develop their research bases and to improve the quality of science and engineering research conducted at their universities and colleges. EPSCoR is successful at identifying, developing, and utilizing a state's academic science and technology resources in a way that supports wealth creation and a more productive and fulfilling way of life for a state's citizenry. This program is particularly important to the 1890's institutions. Land Grant Universities in EPSCoR states have built important linkages through this program that have resulted in lasting improvements to the state's academic research infrastructure and increased national R&D competitiveness. Continued investment in this program is critical.

Thank you again for the opportunity to provide testimony to the subcommittee regarding the National Science Foundation's fiscal year 2000 budget. I strongly urge the subcommittee to support the NSF fiscal year 2000 budget proposal and I look forward to working with you, the NSF, and other agencies to address the science and technology needs of the future.

PREPARED STATEMENT OF THE COUNCIL FOR CHEMICAL RESEARCH

ISSUE

The National Science Foundation (NSF) is the only federal agency with the responsibility for research and education in all scientific and engineering fields. It is the heart of the Nation's science and technology enterprise. Any erosion of this enterprise will impact many areas of our Nation. The 9.1 percent increase in the NSF budget for fiscal year 1999 provided an opportunity to address the declining purchasing power of NSF funding that has occurred since fiscal year 1995. The fiscal year 2000 budget must continue to address these impacts which fall directly on today's researchers, students, and population overall.

POSITION

The Council for Chemical Research (CCR) appreciates the support of both the President and the Congress that resulted in a 9.1 percent increase in the NSF budget for fiscal year 1999. This increase began to address the loss of purchasing power

of the NSF budget that has occurred since fiscal year 1995. CCR also appreciates the President's submission of a 5.8 percent increase for the NSF fiscal year 2000 budget to a level of \$3.954 billion. However, the Council believes it is important to go farther than this. Greater support is needed for the physical sciences that form the basis for advances in so many other areas. In particular, we urge larger increases than the proposed 2.2 percent to chemistry and 2.1 percent to materials research. Additionally, CCR along with other members of the Coalition for National Science Funding asks Congress to support a 15 percent increase to the overall NSF budget. This increase will enable new discoveries and educate the world's best scientists and engineers; it is clearly in the best interests of the Nation and crucial to our continued economic growth.

RATIONALE

Not only is NSF the guarantor of basic research for the United States, but it has a primary role in building the science and engineering workforce of the future and helping to educate the public about science in an increasingly technological world. As leaders of the Nation's chemical research enterprise, CCR well understands the role of NSF funding on scientific research, on kindergarten through post-graduate education, and on enhancing public understanding of science and technology.

NSF provides the core research and infrastructure upon which all can build. Nearly half the research cited in chemical industry patents is from public science, and most of that science was supported by NSF. These contributions at the basic end of the R&D spectrum enable the science and technology enterprise. In the chemical sciences and engineering alone, such research has contributed to the development of plastics, synthetic fabrics, cleaning products, fuels, medicine, advanced electronics, environmental solutions, and many other necessities of modern life.

The budget decisions confronting government decisionmakers are not easy. The case for investing in the future by funding NSF at the level requested, or more, must stand up against concerns about spending for individual health and security. NSF is only about 0.2 percent of the federal budget, but it provides nearly 25 percent of all federal support to academic institutions for basic research. Although it is classified as part of the discretionary budget, funding for the Foundation should be properly viewed as an investment that yields very high return to our society. Half our economic growth in the past fifty years has come from technological innovation and the science supporting it. It therefore follows that decisionmakers must take a long view in choices that affect the future capability of the Nation's innovation engine.
